We don't want hospitals to engage in the practice of medicine and we don't want them to exploit physicians. At the same time we must recognize the fact that departments of radiology, pathology and anesthesiology should

---

Address to the House of Delegates by Elmer Hess, M.D., President of the American Medical Association, at Boston, Nov. 29, 1955.

be self-supporting. Above all there should be the realization on both sides that the welfare of patients supersedes everything else. We cannot afford to let the quality of care for hospital patients suffer because of internal bickering over operating policies. The differences which exist between certain physicians and hospitals can be resolved through intelligent discussion across a conference table. If we cannot work out our own problems sensibly then we have no right to insist that outside influences be excluded.

Another sore spot which has arisen in various parts of the country is the dispute over circumstances under which medical school faculty members are permitted to engage in the private practice of medicine as a means of supplementing income. This situation has created bad publicity in some of the cities I have visited. Surely, intelligent and temperate discussion of this problem within the profession would be more desirable than a public brawl. I understand that the Council on Medical Service is to make a progress report at this session on the exhaustive study of the problem which is being made in cooperation with the Council on Medical Education and Hospitals, the American Hospital Association and the Association of American Medical Colleges. Please let's work this out according to the needs of a given situation in a manner befitting intelligent, well-educated and mature men.

There has also been called to my attention in various parts of the country certain activities of the Joint Commission on Accreditation of Hospitals. I am hopeful that the Committee which has been appointed to review functions of the Joint Commission will come up with recommendations that will eliminate the points at issue. The citizens of this country, the hospital and the medical profession owe much to the Joint Commission for the protective service which it has always rendered. We should be able to iron out any wrinkles which may exist.

I think also that one of our greatest internal problems is a reluctance to recognize the fact that we are not cast from a perfect mold. A major responsibility which we have to the people we serve is to assure them of top quality medical care by men of unquestionable integrity. We help neither ourselves nor the public when we close our eyes to the misdeeds of the very few among us who care not for the pledge of ethical conduct. No matter what station a physician may have reached in his community, the members of his society should be ruthless in dealing with him when it is proved that he has aborted the Principles of Medical Ethics by which we are all bound.

Now I would like to turn for a moment to some of our external problems. As you all know there have been some changes in the doctor draft law during the past year. However, these still leave much to be desired. It is my firm belief that the doctor draft will continue indefinitely unless we get Congress to do something about it. If present conditions of service are allowed to exist in our armed forces, the career medical man may become extinct. As of the moment only one-third of the Naval Medical Corps is composed of career personnel. The balance is made up of reservists and draftees. I am sure that a similar situation exists in the Air Corps and the Army. During the past few months I have given this matter much thought and I am prepared to present several plans for our action. I believe that the A. M. A. can take positive leadership in solving this very important problem. We can be of good service to Congress by showing the way it can be done. From conversations I have had with military personnel of various grades, I feel that 80% of the problem involves economics. Another part lies in the recruitment program for career services. A committee at the Pentagon has already launched a study into this problem and I think it is our responsibility to offer all the help we can.

In the field of legislation there is another development which I think should command our special attention. During the last session of Congress the House of Representatives adopted amendments to the Social Security Act which would permit cash payments for total and permanent disability after the age of 50, make women eligible to receive their pensions at age 62 instead of 65 and extend certain dependency benefits. These amendments are now before the Senate Finance Committee. I think we all realize that Social Security is here to stay and few of us have any violent objection to the over-all program. However, we are directly concerned with phases of the law which pertain to medical matters. It seems to me that at every session of Congress in recent years office seekers have vied with each other in seeking to amend the program so that it would appear our citizens will get more for nothing.

The ink was hardly dry on the disability-freeze amendment before this Congress came up with H. R. 7225, the provisions of which I have just outlined. We have not yet had any experience with the "freeze" results. Why not wait until we see how this works before attempting something new? There are many questions that have to be answered before we rush ahead with promises of alleged greater benefits to our people. Can we afford the increased taxation? After all, that is the only way the so-called benefits can be financed. What is the definition of total and permanent disability? I know of one area where there are four agencies caring for the total and permanently disabled. I might add that they are doing a good job. However, each of the four agencies has an entirely different definition of total and permanent disability. Who winds up in the middle on this? The doctor, of course. I think that the citizens of this country should insist on a complete reevaluation of the Social Security program. As citizens, as well as physicians, we should join in demanding that such a study be made. So far as I know, a survey of this nature has never been made in the 20 years of the program's existence.

The first half year of my presidency is now about over. I can see the three-quarter post ahead of me and know that the home stretch is just beyond. This is an office which has many rewards and many trials. In the year I served as president-elect and since my inauguration last June, I feel that I was the one who gained the most from the thousands of miles of travel by train and plane, from coast to coast and border to border.

I have seen unfolded the magnificence of America and its people. I have shared with them their ambitions and achievements. If through some magic I were granted the fulfillment of one wish, I would wish that every man, woman and child had the opportunity to see and know America as I am doing now. Whether you thrill to the sight of towering masterpieces in steel and glass, or enjoy the simple luxury of ice water on tap in the heart of a desert, the realization comes that this is the product of enterprising, free Americans; that the guarantee of independence and individual rights stimulates and develops incentive.

The physicians of America share with all our citizens these priceless blessings. And they treasure these God-given rights as do the laborers, the farmers, the journalists, the businessmen and the industrialists; as every individual who has pride in his own ability and integrity and who prizes the self-respect that can be earned only through self-reliance. American medicine is proud of its contributions toward the preservation of these principles. We will always serve our nation and its people with unwavering devotion.

WHAT'S AHEAD FOR AMERICAN MEDICINE

It does not take a Swami with a crystal ball to forecast what socioeconomic developments the American medical profession has to face in the coming year. Events of the past few months already foreshadow the future. What we do need is the genius with which to cope with the problems that have been and are now being created. The year 1956 will bring with it another presidential election. Scores of pressure groups, motivated primarily by self-service, will flood Congress and the leaders of both major political parties with strong demands for favors in return for votes. The hapless citizen, enthralled by flowery oratory, his vision dimmed from viewing many political rallys on television will perhaps be unaware of the hand that takes money from his own pocket and places it again before him on the silver platter of largess. The transition, as always, will leave him a little less to put back into his purse.

In the months ahead, political candidates at every level of our government will sing in crescendo the national theme song of election campaigns, "I Promise Thee." Higher parity for farmers, special legislative measures for labor, more benefits for veterans and greater social security coverage for all. Unless we have a radical departure from past performances, little will be said about how we will finance this promised manna from the campaign headquarters. Among the political lollipops which will be dangled before the public will be many measures affecting the medical profession. In the past session of Congress there were introduced 403 bills and resolutions pertaining to medicine. This was only four less than the total number we had to deal with in both sessions of the 83rd Congress. Just like the weather, everyone is interested in health and our lawmakers are well aware of this fact.

During the next session of Congress we can expect the introduction of a proposal for the building of a national library of medicine and a museum of medical history. The museum would feature educational exhibits on historical developments in medical history and would be open to the public. The national library of medicine was suggested by the Hoover Commission. We certainly have an interest in these proposals and should offer whatever assistance we can in bringing them to fruition.

The earning power and living standards of the nation's 9½ million low income families will come under intense scrutiny of Congress during the next session. Physical and mental disabilities of these people will constitute one phase of the study and will undoubtedly affect any proposals that are made. The American Medical Association should be able to provide considerable assistance in this project. Through its Council on Medical Service it has been studying the medical care problems of low income groups for several years. We are now cooperating in a survey of mental illness and health problems in the United States. This, too, will result ultimately in legislative proposals that will affect the profession of medicine. It is a project that we should watch closely as it develops.

Then we have that which I warned against a few moments ago, further amendments to the Social Security Act. The American Medical Association has no quarrel with the over-all program. It is interested only in those phases which specifically affect medicine. We have watched Social Security amendments piled on amendments ever since the inception of the law. There has never, to my knowledge, been a serious reevaluation of the program made in the 20 years of its existence. I think it is time that the citizens of this nation insisted on a full accounting of what is happening to Social Security and what further expansion of the program would mean to every taxpayer. Some of the more recent amendments which have been proposed would have a serious effect on the practice of medicine in the United States. Our congressmen should be informed fully of our feelings on the subject.

Today you will hear this topic discussed in greater detail and I will not take up any more of your time in talking about it now. The year ahead will keep all of us busy, much busier than we have been for some time. Those of us who are attending this meeting have one major purpose in common—continued improvement in the public relations of the medical profession. I think the key to the way people outside the medical profession regard us is the manner in which we regard them. It is time that we learned to live with our neighbors in our respective communities. We are no more perfect than any other group in our society. We have no monoply on service to humanity. It is our responsibility, individually and collectively, to seek out other groups with whom we can communicate intelligently. No one is going to give one hoot in hades about the problems of the medical profession if we sit on our pedestals waiting for others to come to us.

Our training may have bred in us the habit of individual responsibility, but we are not the only persons with such training. There are millions of other individuals in this country who are just as interested in the promulgation of our free enterprise system as we are. Many of them feel even more strongly about the threat of socialism than we do. Whatever political battles the medi-

---

Keynote address delivered at the eighth National Medical Public Relations Conference by Dwight H. Murray, M.D., President-Elect of the American Medical Association, at Boston, Nov. 28, 1955.

cal profession may have won in the past were not won by physicians alone. Victory was achieved only through the support of millions of other voters. And we will always need this support in every legislative enterprise which commands our interest.

We talk much about how good medical public relations begins in each doctor's office. Unfortunately, that's where most of it also ends. Outside of his office, many a doctor shields himself from contact with other citizens like a cloistered nun. He uses his wife and children as a buffer between himself and his neighbors. Join the P. T. A.? Sorry, too busy. . . . Serve as an official of the local Boy Scout Troop? My boy is a member, but I haven't much time to help out. . . . How about acting as health officer of the Boys' Club? I'd like to very much, but. . . . Lions Club? Rotary? Kiwanis? Elks? Chamber of Commerce? Yes, I'm a member and I will try to get to the next meeting, but you know how it is.

Is it any wonder, then, that we get the feeling so often that nobody understands us and our problems? How can they? We never give other people a chance to know us. Do we understand our neighbors and the rest of the citizens of our respective communities? Hardly. We know their appendixes, and their kidneys and their livers and their tonsils, but we don't know what makes them tick as fellow human beings who live and eat and work and play just as we do. If we would but stop and look around we would learn that we have many things in common with our neighbors and they would be very willing to help us with our problems if we would help them with theirs.

Quite often when we set out to do a job of public education we think in lofty terms—brochures, pamphlets, magazine articles, radio and television programs, forums, symposiums, luncheon and dinner meetings. Yet we ignore the simplest, least expensive and most effective medium of communication—word of mouth, neighbor-to-neighbor and person-to-person. People like to ask questions and they want immediate answers. They can't talk to a pamphlet or a magazine. They can't interrupt a radio or television program. And quite frequently then we set up public meetings, at which we invite questions from the audience, the question period is so short that the moderator closes the meeting before most of those in the audience have had an opportunity to get over their initial stage fright. Don't misunderstand me. I am not suggesting that we eliminate the popular, accepted mediums of mass communications. It is my hope that we will learn to augment these excellent devices with the more intimate mode of communication, personal chats with our neighbors and the rest of our nonmedical friends. It might be a good idea to key our public relations programs for 1956 to this spirit of neighborliness.

The technical aspect of public relations in medicine has grown considerably during the past few years. Many state and county medical societies have employed full-time public relations people to assist the public relations chairmen and their committees in formulating workable programs of getting medicine's story to the public. At A. M. A. headquarters, Leo Brown, in compliance with the wishes of the House of Delegates and the Board of Trustees, has organized a public relations department that is second to none in this country. The members of his staff are highly skilled in all phases of PR techniques and they are at your service, around the clock if needs be.

A good job has been done by everyone—at the county, state and national levels—in putting across a formal public relations program for the medical profession. You have all cooperated splendidly and approached the many problems confronting us with intelligence and a remarkably high degree of ability. It would be easy to sit back now and drift into a dream world of complacency. This is something we cannot afford to do.

It is at this point that we should reexamine our respective PR programs and resolve to clobber the cliches, improve old techniques and develop new ones. There is a great deal of PR talent assembled in this room. Surely among us there must be some fresh ideas and untapped stores of imagination. As we approach 1956 we still have to cope with the oft-repeated charge that organized medicine is against every measure that would enhance the health and welfare of our nation's citizens. We still have to get around the problem posed by the individual who says that "my doctor is wonderful, but the other you can have." We need not delude ourselves; our work is far from finished.

I think that in the year ahead we should work even harder than before to further improve our relationship with the press. These are the people who daily put into print the message we want to carry to the general public. They are not our servants nor our employees and should never be so regarded. We should learn to tell our story in such a way that it is always newsworthy. We should not rely on personal friendships with publishers and editors to bring extraordinary pressure on reporters for coverage of our various meetings and functions. The emphasis should always be on the newsworthiness of what we do and say and not on personalities. A press item which is printed merely as a courtesy to a friend has no value whatsoever. The only person who will read it is the one who imposed on his friendship with the editor or publisher. Our job during the year ahead will be more clearly defined by the speakers who follow me. Nowhere in the excellent program which has been arranged by the Public Relations Department do I see a low spot. We have much to learn at today's conference and I'm certain that the time you spend here will pay many dividends when you go back to your respective communities.

Public relations is not the nebulous glob of gobbledygook that some people make it sound like. In the past 25 or 30 years it has developed into a profession that requires many exacting and specific skills. The public relations chairmen of our medical societies need the assistance of those who devote their full time and specialized knowledge to this field. Wherever possible the services of these specially trained men and women should be obtained, even if only on a part-time consulting basis. In the long run the entire medical profession will benefit from such a policy. Another year is ahead of us, bringing with it challenges—some old and some new. No problem is so great that it cannot be solved. None is so small that it should be ignored. Let's shine up the old tools and pick up the new and get to the job ahead with vigor and imagination. The scope of our projects should be limitless.

REPORT ON ACTIONS OF THE HOUSE OF DELEGATES, NINTH CLINICAL MEETING, NOV. 29-DEC. 2, 1955

The following statement is a brief report prepared in the office of the Secretary of the American Medical Association and is a summary of some but not all of the actions taken by the House of Delegates at its meeting in Boston. In subsequent issues of THE JOURNAL *a more detailed abstract of proceedings will appear, and, when these have been published, in due time there will be made available from the office of Secretary of the Association the official proceedings in booklet form. These will be available on request direct to Dr. George F. Lull.*—ED.

Social Security, the report of the Committee on Medical Practices, grievance committees, and revisions of the Code of Medical Ethics were among the major subjects of discussion and action by the House of Delegates at the American Medical Association's Ninth Clinical Meeting held Nov. 29-Dec. 2 in Boston.

Named as the 1955 General Practitioner of the Year was Dr. E. Roger Samuel of Mount Carmel, Pa., whose selection by a special committee of the Board of Trustees was announced at the opening session on Tuesday. Dr. Samuel, a former member of the House of Delegates and a general practitioner for 35 years, received the medal and citation presented annually for community service by a family doctor. Dr. Gunnar Gundersen, A. M. A. Board Chairman, who made the award to Dr. Samuel, also presented a special citation to Dr. Torald Sollmann of Cleveland, charter member of the A. M. A. Council on Pharmacy and Chemistry for over 50 years and its chairman since 1936. Dr. Sollmann, 81 years old, was honored for his "outstanding service to the medical profession and on behalf of the advancement of medical science."

Total registration at the end of the third day of the meeting had reached 7,027, including 3,672 physicians.

SOCIAL SECURITY

Major legislative policy action taken at the Boston meeting involved H. R. 7225, known as the Social Security Amendments of 1955. This bill, which was passed last summer by the U. S. House of Representatives and is now pending before the Senate Finance Committee, includes a proposal for federal cash benefits to selected individuals judged to be permanently and totally disabled. The House of Delegates adopted a substitute resolution proposed by the Reference Committee on Legislation and Public Relations to combine the intent of four resolutions and three supplementary reports of the Board of Trustees dealing with H. R. 7225 and other aspects of Social Security. The substitute resolution stated the following policy:

That the American Medical Association reiterate in the strongest possible terms its determination to resist any encroachment upon the American system of medical practice which would be detrimental to our patients, the American people;

That the American Medical Association urge and support the creation of a well-qualified commission, either governmental or private or both, to make a thorough, objective and impartial study of the economic, social and political impact of Social Security, both medical and otherwise, and that the facts developed by such a study should be the sole basis for objective non-political improvements to the Social Security Act, for the benefit of all of the American people;

That the American Medical Association pledges its wholehearted cooperation in such a study of Social Security in the United States, and will devote its best efforts to procuring and providing full information on the medical aspects of disability, rehabilitation and medical care of the disabled, and

That copies of this resolution be transmitted to the President of the United States, to all members of the Cabinet, to all members of the Congress, and to all constituent state medical associations.

OASI COVERAGE OF PHYSICIANS

In another action on Social Security, the House passed the following resolution designed to determine the exact attitude of physicians toward compulsory or voluntary coverage under the Social Security system:

WHEREAS, Misunderstanding exists about the position of the medical profession on the question of the inclusion of physicians in the Old Age and Survivors Insurance provisions of the Social Security Act; therefore be it

Resolved, That the House of Delegates of the American Medical Association recommend to state societies that they poll their entire membership on this question and that the results of the poll be transmitted to the Board of Trustees of the American Medical Association as soon as possible.

REPORT ON MEDICAL PRACTICES

The House passed a substitute resolution offered by the Reference Committee on Insurance and Medical Service to implement the findings and recommendations of the Committee on Medical Practices (Truman committee), which studied the basic causes leading to certain unethical practices and unfavorable publicity. The resolution adopted with the proviso that it is subject to review by legal counsel, includes the following points:

That a Continuing Committee on Medical Practice be created in the American Medical Association to conduct a study of the relative value of diagnostic, medical and surgical services and to report its findings and recommendations to this House in the same manner as is now followed by other committees and councils of the Association;

That this committee shall consist of five members of the House appointed by the Speaker, three of whom shall be general practitioners; . . .

That this committee be directed to utilize all possible means to stimulate the formation of a department of general practice in each medical school;

That the American Medical Association approve of the medical school teaching programs which afford the medical student opportunity for experience in the general practice of medicine;

That the representatives of the American Medical Association on the Joint Commission on Accreditation of Hospitals be instructed to stimulate action by that body leading to the warning, provisional accreditation or removal of accreditation of community or general hospitals which exclude or arbitrarily restrict hospital privileges for generalists as a class regardless of their individual professional competence, after appeal to the Commission by the County Medical Society concerned;

That this committee cooperate in every way and assist the Public Relations Department of the American Medical Association to present a program of public education designed to bring about a better understanding of all fields of medical practice, and

That this committee use its full influence to discourage any arbitrary restrictions by hospitals against general practitioners as group or as individuals.

In a complementary action on the same subject, the House also approved a supplementary report of the Board of Trustees that included the following suggestions: 1. All nonsurgical groups should be asked for their suggestions and cooperation in carrying out a public education program on the value of diagnostic and medical work. 2. The various boards should be encouraged to reappraise the practice restrictions on their board diplomates. 3. The American Medical Association should continue to discourage arbitrary restrictions by hospitals against general practitioners. 4. Organized medicine is "ready, willing and able to solve satisfactorily its own problems, and such assurance should be given to the American Hospital Association or any other group concerning itself with such problems."

GUIDES FOR GRIEVANCE COMMITTEES

The House approved the report of the Committee to Recommend Guides for Grievance or Mediation Committees and commended the Committee for "their superb approach to this problem." Purpose of the guides is "to promote general uniformity of organization and function of grievance committees—and better understanding of their purposes—without interfering with the inherent autonomy of constituent medical associations. Constituent associations are therefore urged to implement these guides without delay."

The Reference Committee on Miscellaneous Business made the following recommendations, which were adopted by the House:

> Your reference committee desires to support the recommendation that a brochure be published promptly which will outline the recommendations regarding the activities of Grievance Committees and that this brochure be given wide distribution.
>
> We recommend also that there be an appendix to this brochure in which additional, practical suggestions shall be included.
>
> We desire also to support the contention that there should be no equivocation concerning the naming of such committees and we recommend that a uniform policy be adopted in which they are called frankly "Grievance Committees."
>
> Finally, your reference committee recommends that because of the many variables, including the laws of the several states, which may influence the operations or procedures followed by State Grievance Committees, legal counsel shall be sought at the local level within the states.

MEDICAL ETHICS

A proposed revision of the Principles of Medical Ethics and Precepts of Manners of the American Medical Association was submitted to the House by the Council on Constitution and Bylaws. The following reference committee suggestion was adopted by the House:

> In discussion it became evident that there was need for wide distribution of these principles and careful study of the proposed changes not only by this Reference Committee but also by all members of the House and in fact all members of the Association. It seemed desirable also that the two Councils (Council on Constitution and Bylaws and the Judicial Council) should meet in joint session to consider these proposals. Your Reference Committee therefore recommends that these proposals be tabled for further consideration at the next annual session of the House to be held in Chicago in June, 1956.
>
> In the meantime, it is recommended that these proposals in their entirety be widely publicized and that consideration be given to publishing, in the Journal of the American Medical Association and also in state medical journals, these proposed changes in the Principles. It is also recommended that consideration be given to the mailing of copies to each member of the Association. Finally, your Reference Committee recommends that prior to the meeting in Chicago next June the Council on Constitution and Bylaws and the Judicial Council meet in joint session to consider these proposed changes.

In another action on revisions of the Principles of Medical Ethics, the House also approved a plan requiring that all resolutions dealing with changes in the Principles of Medical Ethics shall be considered over a period between sessions of the House before final adoption.

MISCELLANEOUS ACTIONS

Among many other actions on a variety of other subjects, the House of Delegates also: (1) recommended that the Board of Trustees give consideration to a dues increase for all Association members, with the increase designated for contribution to the American Medical Education Foundation; (2) adopted a resolution on the practice of pathology declaring opposition to "the division of any branch of medical practice into so-called technical and professional services"; (3) recommended that further purchase and distribution of Salk poliomyelitis vaccine be carried on by the presently available commercial avenues used for other immunizing agents, and that all vaccines, once proved, should enter the usual channels of distribution; (4) approved appointment of an A. M. A. committee to study the prevention of highway accidents; (5) commended the Women's Auxiliary of the A. M. A. for its financial contributions in support of medical education and requested the Auxiliary to continue its active efforts; (6) commended the Sears Roebuck Foundation for its thoughtfulness and foresight in sponsoring the new plan for financial assistance in establishing medical practice units; (7) received progress reports from the Commission on Medical Care Plans and from the A. M. A. Law Department on its studies of professional liability; (8) approved a Board of Trustees recommendation that the State Journal Advertising Bureau be separated from the American Medical Association and be given full autonomy; (9) congratulated the physicians of Iowa for their efforts in supporting the position that the practice of medicine is the right of the individual; and (10) approved the selection of Minneapolis for the 1958 Clinical Meeting and Chicago for the 1960 Annual Meeting.

OPENING SESSION

Dr. Elmer Hess, A. M. A. President, told the opening session of the House that complacency should be regarded as the medical profession's greatest enemy. Although good progress is being made in informing the public and the profession of the objectives of organized medicine, he said, educational efforts must be intensified and the list of physicians' tangible accomplishments for the health benefit of the public must be increased. Dr. Leo H. Bartemeier, Chairman of the A. M. A. Council on Mental Health told the House that the new Joint Commission on Mental Illness and Health will be ready to embark on its nationwide study and reevaluation of the human and economic problems of mental illness after the first of the year. Dr. Bartemeier, who is chairman of the board of trustees of the commission, appeared before the House to explain the functions of the new commission, which was organized to carry out the Mental Health Study Act passed by Congress earlier this year without a dissenting vote in either house.

MEDICAL EDUCATION CONTRIBUTIONS

The A. M. A. Board of Trustees announced that it again has appropriated $100,000 to be contributed to the American Medical Education Foundation for the support of medical schools. The California Medical Association presented a $25,000 check to the AMEF, and the Utah State Medical Society announced an $11,000 contribution.

PUBLIC RELATIONS

PUBLIC RELATIONS SOCIETY OF AMERICA

I have been invited to speak to you about the various attitudes of the public relating to medicine, and to participate in your panel discussion. You wish to know what we of the profession of medicine are doing as individuals and as organized groups to combat these attitudes. In my opinion we must approach this by thinking of two things: first, the public's failure to understand the problems of doctors and, second, the doctor's failure to understand the psychological needs and the problems of the patient and his family.

The failure of the public to understand the doctor's problems has much in common with the story of our city of Los Angeles. For years Los Angeles was advertised and publicized all over the United States, by deliberate plan, to entice people and industry to our area. Eventually there became fixed in the public mind the belief that nothing could be disagreeable or unpleasant in Los Angeles, the paradise spot of the world. The truth is that there is smog—transportation is a mess—the orange groves are being torn out to be replaced by row on row of houses. The mocking birds are now a rarity. To drive from our once beautiful mountains to our once beautiful beaches is now a day's ordeal of traffic bedlam. Yet the people still come believing that all is bliss once they reach Los Angeles. There are wonderful things here in Los Angeles. There are great advantages here, but the stereotyped ideas of the public concerning Los Angeles are somewhat erroneous. So it is with medicine.

Medicine has advanced so rapidly and to such a great degree—the miracles of medicine have been romanticized—TV and radio programs and magazine articles have extolled them so invitingly (though often incorrectly) that now the public believes implicitly that medicine is an exact science and that if only a doctor takes an interest in a case and does what is right that inevitably a cure can be assured. On the contrary, medicine is not an exact science. It depends so much on so many variables in individual reactions—in bodily structure—in the physiology and psychology of a patient (to say nothing of the skill and personal ability of the physician who will make the decisions) that by no means can we say that in medicine one thing must follow another.

Nor does the fact that in medicine many procedures are so common and usually unaccompanied by bad results allow us to accept good results as being inevitable sequelae. Yet so widespread is that belief that recently one judge of our courts ruled that, since hypodermic injections are commonly made without trouble and since everyone has, at some time or other, had an injection of some sort, it follows that, if any complications arise following the injection, that fact is of itself prima-facie evidence that the injection was unskillfully given or negligence was present. How stupid can we be in judging cause and effect? Yet such things cause malpractice suits and problems for the doctor.

The truth is that often, when two parties are concerned in an endeavor, great dissatisfaction occurs when one party expects to be given more from the other than that other can possibly provide. This often holds true in the practice of medicine. If a person be saved from death from one cause, it is inevitable that some other illness will claim him at a later date. Doctors can only extend the period of life and influence the manner of eventual passing. Doctors cannot give perpetual freedom from illness and death. I believe another failure of understanding by the public is in regard to a doctor's finances. Many people believe that all doctors are wealthy and have income other than that which they derive from their practice. This is not true. These people also believe that a doctor should be completely self-sacrificing with little interest in his own or his family's comfort and welfare.

Now I grant you that only part of the people are this misinformed in regard to medicine, but there is a definite percentage of such people. Some think that if the doctor were kindly disposed he could cancel all his bills or at least reduce them to a nominal amount. Others even believe that doctors are responsible for or set the charges of hospitals. Often a doctor is called and asked to speak to the superintendent of a hospital and tell him to reduce the charges or to cancel them because the patient thinks they are too high. I grant you that costs are high. At times they may be exorbitant. I do know that people who are not entirely familiar with medicine or hospital procedures are not competent to judge the appropriate fee for most procedures. The drawing of blood for a test is the least part of such test. Yet this is all the patient sees. The making of stained tissue sections and their microscopic study are complex, involved procedures that cannot be visualized by the uninitiated person.

Now we must say something about the doctor's failure. Doctors often fail to explain findings or procedures to their patients. They fail to make the patient feel that he is a part of the cure and to really enlist him and his family in the proper conduct of the illness. Doctors fail sometimes to realize that not only is a disease present but that environment and other factors may be the important things governing success or failure in treating a patient.

Read by E. Vincent Askey, Speaker of the House of Delegates, before the Eighth National Public Relations Conference, Los Angeles, Nov. 16.

Often emotional factors are more important to the patient's welfare than the reason he gives for calling the doctor. Good doctors sometimes fail to see that kindness, pleasant personality—bedside manner, if you please—or even an engaging handsome appearance are the reasons why some patients will continue to go to incompetent, irregular cultists or practitioners interminably, even though the disease condition is getting worse day by day under improper treatment. So what are we doing about these things and others?

The medical associations constantly are trying to acquaint the public with the true state of knowledge in medicine by means of talks, magazine articles, sponsored TV and radio programs, panel discussions, public health fairs, and expositions. Perhaps that has been the trouble. We have been so busy trying to give the public the real value information in regard to sickness and health that we have ignored other things the people can really understand. The patient is not so much interested in all the scientific aspects of a disease as he is in some other factors involved. How dangerous is it? How long will he be disabled? Will it leave any permanent disability? How much is this all going to cost?

People have to have something they can see for their money. They resent paying for something (especially an illness) they didn't want in the first place and for which they have little to show after it has gone. Some people complain about paying a physician for an examination if it discloses nothing abnormal, although they willingly pay many times more for a bridge or plate that improves their appearance. They would much rather pay for a hairdo by a hairdresser of note. The doctor should explain to the patient, therefore, what he has done for him. In fact, perhaps the patient should be given some one outstanding benefit to dwell on that he can tell about to his friends.

However, perhaps we should admit that those problems that we have solved in public relations have come as a result of our learning how to work with the press and with you public relations experts. We now see increasing willingness of the press to give true pictures rather than those that to our eyes seem distorted. Sometimes we really need you people to put our words into a language that the public can understand. I might illustrate this need by quoting to you what a stenographer typed after hearing a doctor explain the reason a very prominent man had died. Her transcription read as follows: "A great deal of the pyrosless became strundered and the eflux shunted anseribly to the left. The A-G ratio gonflowed and soporified the blood plasma. This consequently caused a great deal of congestion of the portal system. We had very little left to work with. What else could we do?" Now did you ever hear such gibberish? Yet some people complain that their doctor won't tell them anything. But I must hasten.

The medical profession has tried to determine by surveys what the actual situation is. Recently the Los Angeles County Medical Association has completed a survey that shows many surprising things. The most surprising to me is to find that the people really think that we are O.K. The love and respect given us by our patients make us truly meek. We have promoted methods by which the financial hardships of the patient may be relieved. The Blue Cross, the Blue Shield, many voluntary insurance plans began with our profession's sponsorship. The quasi-eleemosynary organizations such as the Tuberculosis Association, the Cancer Society, and the legion of others began with and continue by reason of our cooperation. We have opposed just as vigorously those things that we have believed to be against the best interests of the public's health. Socialized medicine, by whatever name called, is not good for the public and we oppose it. We need more good doctors and not a plethora of more poor doctors.

We welcome the interest of you men of skill in bringing truth to the public. We are firmly convinced that, if people were taught in school, in the press, and in other ways that the expectation of a certain amount of illness during their lifetime is normal, we could teach them also to take proper steps to avoid the hardships that illness always brings both in an economic as well as a physical way. Our children are being taught that only health is normal and they come to believe that, if sickness strikes, it is unfair. Children become adults but they carry over their resentment of all illness as being abnormal. Sometimes they resent even the doctor because he is associated with the primary object of their resentment.

To summarize, medicine's public relations problems stem, in part, from the fact that ours is a service normal people don't look forward to enjoying. Even after we have given good service, many people have the feeling of paying for something they didn't want in the first place. Our press has been too good. As a result, we are expected not only to subordinate our self-interest to the vital interests of the patient, which is reasonable, but also to be without any self-interest. We are expected to dispense only wonder drugs and to achieve only miraculous cures, whereas medicine is not an exact science and probably never will be. In any situation where the public expects more than a profession can deliver, disappointments, dissatisfactions, and, eventually, bad public relations are the result.

We are attacking—successfully in most instances—problems having to do with the availability, cost, distribution, and failures in the quality of our services. This is being done through programs of sickness insurance; ethical collections; medical social service, public service, or "grievance" committees; hospital standardization programs; 24 hour emergency telephone coverage for large communities; indigent medical care programs; and malpractice prevention. We are improving.

Individually and collectively, the vast majority of my colleagues deserve good public relations. With the help of your colleagues and with a continuously improved performance, I am sure we will earn better public relations. We believe that, if the truth becomes known and if false beliefs be dissolved by that truth, medicine will ascend to a pinnacle as yet unknown. Then the health of the people will approach near their desires and expectations, and we of medicine will see more of the conquests of disease that we have sought so long.

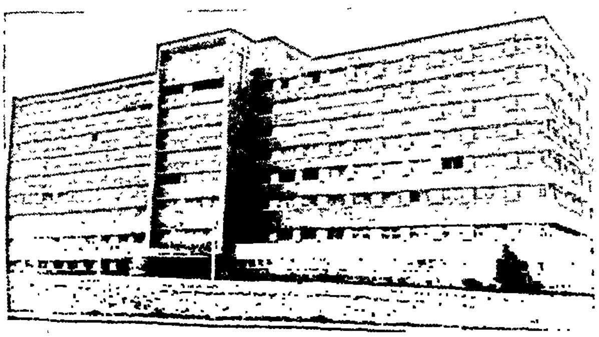
MEDICAL NEWS

ALABAMA

Outbreak of Diphtheria.—Dr. Walton H. Y. Smith, Montgomery, Alabama Department of Health, recently reported that 29 cases of diphtheria had occurred in Russell County between July 15 and Aug. 27. Most of the illnesses were mild. An immunization program was instituted in the county, and, by Aug. 22, over 8,000 injections had been given to children 16 years of age and younger.

ARKANSAS

New St. Vincent Infirmary.—The new multi-million-dollar St. Vincent Infirmary in Little Rock was recently opened, 66 years after the first St. Vincent Infirmary was founded by the Sisters of Charity of Nazareth. The new building has a 425-bed capacity and, when it is completed, will be an $8,500,000 project. The main hospital building contains 12 operating rooms. During the past two years the hospital has cared for upwards of 5,000 patients of all religious denominations. Dr. Henry G. Hollenberg is chief of staff, Dr. John E. Greutter, vice-chief of staff, and Dr. Joseph A. Buchman, secretary. Chiefs of divisions are Dr. Alfred Kahn Jr., medicine; Dr. Frank G. Kumpuris, surgery; Dr. Robert W. Ross, obstetrics and gynecology; and Dr. John M. Smith, general practice. The executive committee is composed of Drs. Jerome S. Levy, medicine; Bennett J. Reaves, obstetrics and gynecology; William G. Cooper, surgery; and John McC. Smith, general practice.



St. Vincent Infirmary.

CALIFORNIA

Survey of Pollinating Plants.—The Allergy Foundation of Northern California has been granted $3,500 from the estate of Joseph A. Murphy by the San Francisco Foundation for a field survey of important pollinating plants in northern California. The purpose of the survey is to determine the distribution of plants commonly causing asthma, hay fever, eczema, and other allergic diseases in this area. It is estimated that the survey will take about two to two and one-half years to complete. The results are to be published in book form, available to the medical profession.

Burn Center.—The St. Francis Memorial Hospital, San Francisco, recently opened its Burn Center, an integral part of the Plastic and Reconstructive Surgery Center. Located on the sixth floor of the hospital, its facilities consist of a ward of four adult beds or three adult beds and three cribs—depending on the need—and a treatment room with a thermostatically controlled treatment tub. The unit is air-conditioned and has ultraviolet lights. The Burn Center is under the direction of a team consisting of plastic surgeons, nurses, anesthetists, and residents in plastic surgery.

Physicians Retirement Association.—The Los Angeles County Medical Association announces completion of the Los Angeles Physicians Retirement Association plan, which, according to Dr. Arthur A. Kirchner, president of the voluntary retirement association and chairman of the county medical association's medical economics committee, is "the first such plan established under the impetus of any county medical group in the United States." The purpose is to enable members of the Los Angeles County Medical Association to save money toward their retirement. The association provides a means whereby the medical association's members may make investments on desirable terms most consistent with safety. At all times, the doctor owns outright the securities that his investments have purchased. Each member will receive benefits in the form of a reduced brokerage fee because of participation in the group.

FLORIDA

Fellowships Available.—The University of Florida College of Medicine, Gainesville, offers fellowships and assistantships for 1956 and 1957 for graduate study in the basic medical sciences. Applications must be filed not later than March 1, 1956. For information write to Office of the Dean, University of Florida College of Medicine, Gainesville.

Appoint Professor of Psychiatry.—Dr. Maurice H. Greenhill, formerly professor of psychiatry at the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, has been appointed head of the department of psychiatry at the University of Miami School of Medicine, Coral Gables, and director of the Psychiatric Institute.

ILLINOIS

Wins Trip to Hawaii.—Dr. Sherman S. Coleman, Northbrook, winner of an all-expense trip to Hawaii for submitting the best paper on bone irregularities in a contest sponsored by the Western Orthopaedic Association, delivered the award-winning paper in Honolulu, Nov. 8, at an assembly of the association. Dr. Coleman, an instructor in orthopedic surgery at Northwestern University Medical School, Chicago, had as his subject the diagnosis of congenital dysplasia of the hip in the newborn infant in which the hip bone develops abnormally before birth.

Chicago

Grant for Research.—The Multiple Sclerosis Foundation of America has presented $25,000 to the University of Chicago Clinics for research on the causes of multiple sclerosis. The funds will be used to support research by Dr. Richard B. Richter, professor of neurology, and Dr. Eugene M. K. Geiling, chairman, department of pharmacology, who will attempt to locate, within the nervous system, certain organic chemical compounds that have previously been injected into the blood stream. For this purpose, drugs and other compounds "tagged" with radioactive chemicals will be used. Some of these drugs are products of the university's "atomic farm," where drug plants are grown in atmospheres containing radioactive carbon dioxide.

Personal.—Dr. Maurice H. Cottle addressed the Baltimore Ear, Nose and Throat Society Nov. 6 on "Significance of Some Newer Anatomical and Physiological Concepts of the Nose." He also demonstrated nasal corrective surgery at Johns Hopkins Hospital and Presbyterian Eye, Ear, Nose and Throat Hospital in Baltimore, Nov. 7 and 8.——Dr. Joseph H. Chivers, medical director of Crane Co. since 1936, has been elected medical director of the Rehabilitation Institute of Chicago, a nonprofit institution concerned with the physical restoration of disabled persons. Dr. Chivers, who will serve as the chief medical officer of the institute, has resigned as volunteer head of the medical advisory committee of the institute to assume his new duties.——Dr. Samuel M. Feinberg, professor of medicine, Northwestern University Medical School, was recently installed as president

---

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education, and public health. Programs should be received at least three weeks before the date of meeting.

of the International Association of Allergology, a group composed of 30 national societies. At the association's annual congress in Rio de Janeiro, Dr. Feinberg presented a paper on allergic reactions to antibiotics. During a five-week lecture tour after the congress, he discussed problems in allergy and immunology at various universities.

LOUISIANA

Course on Fluid and Electrolyte Balance.—A program on fluid and electrolyte balance, under the chairmanship of Dr. George E. Burch, professor of internal medicine, will be presented Jan. 16-21, 1956, at Tulane University of Louisiana School of Medicine, New Orleans. The course, planned as a review of the fundamental principles of water and electrolyte metabolism, will also emphasize the clinical applications of these principles. Frequent conferences and discussions at the bedside of patients will be held. Inquiries may be addressed to the Director, Division of Graduate Medicine, 1430 Tulane Ave., New Orleans 12.

MARYLAND

Friedenwald Memorial Lecture.—Dr. Russell S. Boles, Philadelphia, gave the annual Dr. Julius Friedenwald Memorial Lecture, Nov. 3, at the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, on the medical versus the surgical treatment of gastrointestinal affections.

Appoint Professor of Obstetrics.—Dr. Arthur L. Haskins Jr., assistant professor of obstetrics and gynecology at Washington University School of Medicine, St. Louis, has been named professor of obstetrics and gynecology at the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, to succeed Dr. Louis H. Douglass, who retired July 1.

MASSACHUSETTS

Personal.—Dr. Sidney Farber, professor of pathology, Harvard Medical School, Boston, was named life chairman of the United Cerebral Palsy Research Advisory Board at the United Cerebral Palsy sixth annual convention, Nov. 11-13, in Boston.——Dr. Thomas C. Chalmers, an associate in medicine at the Harvard Medical School, Boston, has been appointed chief of medical service at the Lemuel Shattuck Hospital. For two years Dr. Chalmers has been a member of the department of metabolism at the Army Medical Service Graduate School.

Award to Dr. Yakovlev.—At its annual convention in Boston, United Cerebral Palsy presented the 1955 United Cerebral Palsy-Max Weinstein award for outstanding scientific achievement in cerebral palsy to Dr. Paul I. Yakovlev, clinical associate professor of neuropathology, Harvard Medical School, Boston. The award, which consists of a silver plaque and $1,000 in cash, was given to Dr. Yakovlev for studies in the anatomy and physiology of the human brain. Dr. Yakovlev was recently appointed curator of the Warren Anatomical Museum at Harvard Medical School. During the convention a medical exhibit compiled from his large collection of anatomic specimens of the human brain was shown at the museum for the first time.

Veteran School Physician.—When Dr. David M. Hassman, for 34 years medical director of school health services in Brookline, recently retired from that post, the school committee adopted a resolution, which read, in part: "Whereas he has devoted himself wholeheartedly and generously in the interests of the health of the children and staff members of the public schools, Whereas, through his wise counsel and personal devotion, he has left the imprint of his spirit on all with whom he has been associated, Therefore, be it resolved that the School Committee of Brookline, acting unanimously, pays him tribute and expresses its appreciation and its gratitude for his service to the schools of the Town." Dr. Robert H. Hamlin, the town's health director, has been named director of school health services, and a contract has been entered into with the Children's Medical Center of Boston for the full-time services of Dr. Maurice M. Osborne Jr. as school health physician.

MINNESOTA

Olmsted Community Hospital.—The $750,000 Olmsted Community Hospital, Rochester, was recently completed. At the dedication ceremonies, Dr. Charles W. Mayo spoke on community health and Dr. Walter C. Alvarez, Chicago, formerly of Rochester, on "Role of the General Practitioner." Other physicians participating were Dr. Charles C. Cooper, St. Paul, director, American Academy of General Practice; Dr. Theodore O. Wellner, president, medical staff, Olmsted Community Hospital; and Dr. William F. Braasch, president, board of directors, who called the hospital "the realization of our dreams, the result of voluntary efforts of the citizens of Rochester and Olmsted County, in truly the best tradition of American democracy." The hospital, which has a staff of 21 physicians, has 55 beds and 15 bassinets.

NEW JERSEY

Memorial Fund for Dr. Charles Block.—A memorial fund in honor of the late Dr. Charles Block, Newark, has been organized. The fund will be used for a laboratory to study heart disease in the new research building of Newark Beth Israel Hospital.

Personal.—Dr. Hilton S. Read, Atlantic City, was recently honored by the University of Marburg, Germany, when he received the Phillips medal, which was bestowed by the German consul in New York. The medal was awarded to Dr. Read *in absentia* by the president and senate of the University of Marburg on the occasion of the 428th anniversary of the founding of the university. The citation read, "For meritorious service to the University of Marburg through having made it possible for more than two doctors of Western Germany to receive additional training in the United States of America."

NEW YORK

Professorship in Cardiovascular Research.—The University of Buffalo announces receipt of a $90,000 grant from the Harry Dent Family Foundation, Inc., for the establishment of a professorship in clinical research in cardiovascular diseases. The grant will be applied over a five-year period, $12,000 each year for the professorship and $6,000 each year to cover expenses in conjunction with the research conducted.

Appointments in Pathology.—The Albany Medical College of Union University announces the promotion of Dr. Victor N. Tompkins from associate in pathology to associate professor. Newly appointed as assistant professor of pathology and bacteriology is Dr. William Thomas Smyth, who previously taught pathology at his alma mater, the State University of Iowa College of Medicine, Iowa City, and who is associated with the Veterans Administration Hospital in Albany.

Course in Radioactive Isotopes.—A four-month course in the medical uses of radioactive isotopes will be given Feb. 14, 1956, at the Queens General Hospital in cooperation with the Atomic Energy Commission. It will consist of weekly four-hour sessions of lectures, laboratory exercises, and clinical management of patients. Enrollment will be limited to 15. Information may be obtained from Dr. Leonard B. Goldman, Director, Radiation Therapy Department, Queens General Hospital, 82-68 164th St., Jamaica 32.

Closed-Circuit Television.—At its Postgraduate Assembly, Dec. 7-10, the New York State Society of Anesthesiologists initiated a two and one-half hour closed-circuit television program emanating from the new surgical suite at Bellevue Hospital, New York City. Dr. Emery A. Rovenstine, chairman, department of anesthesiology, New York Post-Graduate Medical School, was principal narrator for the following presentations: "A Preanesthetic Clinic"; "Chlorpromazine in Anesthesia—A Summary of Its Clinical Value"; "Light Ether Curare Anesthesia—A Clinical Study"; "Maintenance of a Constant Level of Pentothal Anesthesia by Means of an Electroencephalographic Servo Mechanism"; "Infant Resuscitation"; "Errors in the Performance of Spinal Anesthesia"; "Anesthesiological Management for Tonsillectomy"; "Direct Laryngeal Photography"; and "Bronchospirometry." The program was produced by the Medical Television Foundation for E. R. Squibb and Sons and the society, with the cooperation of the New York University Post-Graduate Medical School Audio Visual Department, New York University Office of Radio-TV, the New York City Department of Hospitals, and the Dumont Television Network.

Personal.—Dr. E. Nicholas Sargent, formerly of Far Rockaway, Long Island, has been appointed a full-time radiologist for the Virgin Islands.——The division of local health services, New York State Health Department, announces the appointment of Dr. David E. Overton as district health officer, Suffolk County Health Department; Dr. Ian D. McLaren, Olean, as Cattaraugus County health commissioner; Dr. Paul J. Christenson, Utica, as health officer, Utica City Health Department; and Dr. James W. Nolan, Mechanicville, as deputy health commissioner in the Albany County Health Department.——Dr. Karl Miller Wilson, professor emeritus of obstetrics and gynecology, University of Rochester School of Medicine and Dentistry, has been awarded the 1955 gold medal of the University of Rochester Medical Alumni Association for outstanding service to medical education. A member of the original medical school faculty assembled by Dean George N. Whipple when the school was opened in 1925, Dr. Wilson served on the faculty as obstetrician and gynecologist-in-chief at Strong Memorial Hospital until his retirement in 1952.

New York City

Dr. Amberson Accepts New Post.—Dr. J. Burns Amberson Jr., former president of the National Tuberculosis Association, has been appointed director of the New York Tuberculosis and Health Association. Dr. Amberson recently retired as attending physician, Presbyterian Hospital, and professor of medicine, Columbia University College of Physicians and Surgeons, becoming consultant at the hospital and professor emeritus at the college.

Revision of Sanitary Code.—Pursuant to approval of its plans for complete revision and modernization of the sanitary code, the City of New York Department of Health announces a contract between the city and the trustees of Columbia University under the terms of which the Legislative Drafting Research fund of Columbia will undertake the technical work of revising and rewriting the code. Columbia will be paid $160,000 for the work, which is expected to take three years. The board of health was set up in 1866, and its early regulations have evolved into the present sanitary code, the last revision of which was in 1941.

Training Courses for School Physicians.—The bureau of school health and the bureau of child health invite applications from qualified physicians who are interested in training for work in the New York City schools or in the health department's child health stations. As vacancies occur, they are immediately filled from those doctors who have completed the training courses. Doctors are paid on a per session basis for the duration of the course. School health applications may be obtained from Dr. Harold Herman, Bureau of School Health, 125 Worth St., New York 13, or by calling WO 2-6900, Extension 461, or from Dr. Harold Jacobziner, Assistant Commissioner in Charge of Maternal and Child Health, 125 Worth St., New York 13.

University News.—Dr. Andrew Dickson Hunt Jr. has been promoted to assistant professor of pediatrics at New York University College of Medicine. He formerly was assistant professor in pediatrics at the University of Pennsylvania School of Medicine, Philadelphia.——Dr. Margaret H. D. Smith, formerly instructor in pediatrics at Johns Hopkins University School of Medicine, Baltimore, and associate professor of microbiology, Tulane University of Louisiana School of Medicine, New Orleans, has joined the New York University College of Medicine as associate professor of pediatrics.——Dr. Philip H. Sechzer has been named assistant professor, department of anesthesiology, New York University Post-Graduate Medical School. Dr. Sechzer has also been affiliated with Seton Hospital, Fordham Hospital, and the Veterans Administration Hospital, Northport. He served as director of the New York State Society of Anesthesiologists in 1954 and is an adjunct member (examiner) of the American Board of Anesthesiology.

Dr. Schlesinger Goes to St. Louis.—Dr. R. Walter Schlesinger, of the Public Health Research Institute of the City of New York, has been appointed professor of microbiology and director of the department at the St. Louis University School of Medicine to replace Lloyd R. Jones, Ph.D., who, because of ill health, resigned. His appointment will be associated with the construction of expanded facilities for research and education in microbiology with particular emphasis on virus agents, cellular growth, and development. New laboratories, animal quarters, and facilities for tissue culture are being built. Dr. Schlesinger has been affiliated with the Rockefeller Institute for Medical Research, New York, the Institute of Bacteriology and Hygiene at the University of Basel in Switzerland, Beekman-Downtown Hospital, New York, and the Stamford (Conn.) Hospital. During World War II, he served on the Army Epidemiological Board as a member of the Commission on Neurotropic Virus Diseases. After the war, he was associate research professor of pathology and head of the virus research laboratory at the University of Pittsburgh School of Medicine.

NORTH DAKOTA

Personal.—Dr. William E. Cornatzer, head of the biochemistry department at the University of North Dakota School of Medicine, Grand Forks, has been asked by the U. S. Atomic Energy Commission to serve as consultant at the Oak Ridge (Tenn.) Institute of Nuclear Studies. The Atomic Energy Commission has also approved a grant for Dr. Cornatzer's studies on effects of atomic and x-ray radiation on cells of various organs. Grants were recently awarded him by the Lipotropic Research Fund and the American Cyanamid Company for study of lipotropic substances in liver disease.——Dr. Olaf A. Knutson, Buxton, was honored recently by friends and former patients for his 50 years of service to the community, which presented him with a gold watch.——The community of Ellendale recently honored Dr. Roy Lynde in celebration of his 50 years of medical practice. A parade down Main Street to the ball park preceded the program there, during which the athletic field was named after Dr. Lynde. The celebration ended with a night baseball game.

Robert D. Campbell Foundation.—The First National Bank of Grand Forks recently established the Robert D. Campbell Foundation in recognition of Dr. Campbell's service to the community. The resolution read: "The general purpose of the Foundation shall be to advance and promote the best interests of the University of North Dakota, its students, and faculty. It shall contribute to, assist in, initiate and carry on such activities, programs, projects and endeavors as may be deemed by its trustees to be best suited to the general purpose." Dr. and Mrs. Campbell gave to the bank as trustee more than $160,000 to be transferred to the foundation on their deaths. Contributions from any source will be accepted by the foundation to be used for any of its purposes. Dr. Campbell established practice in Grand Forks in 1894. In 1913, he helped organize the American College of Surgeons in Chicago. He is a past-president of the North Dakota State Medical Association. Chief of staff of St. Michael's Hospital in Grand Forks for 28 years, he was resident physician and surgeon for the Northern Pacific and Great Northern railroads from the time he established his practice in Grand Forks until he retired. In 1930, he was made president of the Great Northern Medical Association. Commissioned a captain in the Army Medical Corps in 1917, he was discharged as a major in 1919.

TEXAS

Personal.—Dr. G. Lucile Robey has been chosen "Typical Business or Professional Woman," by the Business and Professional Women's Club of Houston, which she has served as president. She has also been chairman of the health and safety committee for the local club and the state federation and chairman of the international relations committee.

Electron Microscope for Cancer Research.—The University of Texas M. D. Anderson Hospital and Tumor Institute, Texas Medical Center, Houston, has purchased an electron microscope to further cancer research being conducted and supervised by Dr. Leon Dmochowski, professor of microbiology. Baylor University College of Medicine, in the Texas Medical Center. It will also be used for undergraduate and postgraduate instruction courses in electron microscopy.

Mental Health Director Needed.—The Texas State Department of Health announces examinations for director, mental health division (salary range. $9,720-$12,120). The minimum qualifications are (1) an M.D. degree and one year's internship; (2) an M.P.H. degree or certification by the American Board of Psychiatry and Neurology; (3) five years of graduate training and experience in psychiatry or pediatric-psychiatry, including three years of approved training in one of the two fields (the two additional years must be training or experience in psychiatry, pediatric-psychiatry, or public health. One year of training or experience must include work with children. Preference will be given to those having experience in administering a state preventive mental health program or in the capacity of consultant in such a program.); and (4) licensure to practice medicine in Texas. For application write: Merit System Council, 814 Littlefield Building, Austin, or Dr. Henry A. Holle, Commissioner of Health, Texas State Department of Health, 410 E. Fifth St., Austin.

WASHINGTON

Epidemiologist Needed.—Applications will be accepted for the newly created position of medical epidemiologist in the Washington State Department of Health. Applicants must be graduates of an approved school of medicine and must have had a one year rotating internship; one year of graduate training in an approved school of public health; and three years of full-time employment in public health work, including one year of experience in some phase of epidemiology. The examination will consist of an evaluation of pertinent training and experience (100%). A qualifying interview may also be required. A recent photograph should be submitted with application to State Personnel Board, 1069 Capitol Way, Olympia (Mailing address: P. O. Box 688, Olympia).

WISCONSIN

Society News.—At its meeting Dec. 20 in the University Club, the Milwaukee Academy of Medicine will have as guest speaker Rene J. Dubos, Ph.D., head, department of bacteriology, Rockefeller Institute for Medical Research, New York, who will discuss "Physiological State and Susceptibility to Infection." Cocktails at 6 and dinner at 6:30 will precede the scientific meeting.

Student Loan Fund.—A gift of $10,338.75 to establish a loan fund for medical students in financial need has been made to the University of Wisconsin, Madison, by Mr. Richard Hartenstein, Milwaukee, whose son, Dr. Hans Hartenstein, Syracuse, N. Y., is a graduate of the University of Wisconsin Medical School (class of 1947). Individual loans will not exceed $500 within a single year or total more than $1,500. Interest at the rate of 2% a year will not begin until a year after the student has graduated. The Hartenstein family entered this country from Vienna, Austria, as immigrants in June, 1940, after having spent time in a Nazi concentration camp.

GENERAL

Tay-Sachs Association.—A group of Philadelphia parents have banded together to promote research on Tay-Sachs disease, and have formed the National Tay-Sachs Association. A national roster of affected families is desired to complete and enlarge the organization. Physicians are requested to urge the families of Tay-Sachs patients to contact the National Tay-Sachs Association, % Box 9602, Philadelphia 31.

Research on Schizophrenia.—The National Association for Mental Health has received from the 33rd Degree Scottish Rite a grant of $100,000 for research on schizophrenia. The grant will be allocated to a group of 20 projects constituting a coordinated research program on cause, treatment, and prevention. This program, carried on by the National Association for Mental Health for the past 21 years, has been supported by the Scottish Rite since inception of the program.

History of Medicine Medal.—The American Association of the History of Medicine offers the William Osler medal annually to the author of the best student essay submitted to the association. Essays must be submitted before the author's graduation or within one year thereafter. Essays that are the result of original research will be given preference, but the association will also consider other essays that show an unusual understanding of historical problems. Essays, not exceeding 10,000 words in length, must be sent before March 1, 1956, to Dr. Erwin H. Ackerknecht, Chairman, 113 Service Memorial Institutes, Madison 6, Wis.

Anti-Anemia Preparations Board.—Dr. C. Lockard Conley, associate professor of medicine at Johns Hopkins University School of Medicine, Baltimore, has been appointed secretary of the U. S. P. Anti-Anemia Preparations Advisory Board, to succeed Dr. Irving M. London, New York, who served as secretary for the past six years and now continues as a member of the board. The board, which reviews the results of clinical tests and processes applications submitted by the makers of oral preparations, assigns the potency to be claimed for the product. Other members of the board are: Dr. Frank H. Bethell, Ann Arbor, Mich., and Dr. William B. Castle, Boston.

Fellowships for Vacation-Time Study.—The National Foundation for Infantile Paralysis (120 Broadway, New York 5) offers fellowships during 1956 for medical students interested in vacation-time study. The dean of each approved medical school in the United States has been asked to nominate six candidates for these awards: two for research in the biological and physical sciences related to medicine; two for public health and preventive medicine; and two for physical medicine and rehabilitation. Students must have completed one year in medical school to be eligible for the research fellowships and two years for each of the other types of awards. Fellowships provide for full-time consecutive study during a period when the student has a minimum of eight weeks of free time. The stipend will be $200 a month for a minimum of two and a maximum of three months. Interested students should apply to the deans of their schools, who will provide the application forms, which must be submitted to the foundation for approval before the program begins. From six to eight weeks should be allowed for administrative action by the foundation.

Report of Rockefeller Foundation.—The annual report of the Rockefeller Foundation, 49 W. 49th St., New York 20, discloses that, of its total appropriations of $19,107,665 for 1954, the largest amount ($5,102,796) was used for medicine and public health. The largest grants made in the United States went to Harvard Medical School and the Massachusetts General Hospital, Boston, for a joint program of improved teaching in family care and to the Washington University School of Medicine, St. Louis, for a department of dermatology. The principal contribution made to the investigation and control of specific diseases was its virus program, which involved support for work by its own staff and for fundamental virus research elsewhere, including a grant of $210,000 to the virus laboratory of the University of California. The foundation also awarded a grant for continuance of a study by the committee for research in problems of sex, the National Research Council; a grant for study of the inheritance factor in sickle cell anemia to the Child Research Center of Michigan; and $150,000 in support of a proposal from the Department of Public Health of California that a chronic disease epidemiology center be established.

Multimillion Dollar Award for Medical Education.—The Commonwealth Fund has announced the award of $7,150,000 from its capital funds, to help medical schools clarify their educational objectives in the postwar world and to institute or to maintain creative programs in medical education. These unrestricted grants to 10 university medical schools are made in addition to the 2 million dollars already given to medical education by the fund in the fiscal year 1954-1955. Medical schools receiving the grants were: Columbia University College of Physicians and Surgeons, New York, $750,000; Cornell University Medical College, New York, $750,000; Emory University School of Medicine, Emory University, Ga., $600,000; Harvard Medical School, Boston, $1,000,000; New York University College of Medicine, $750,000; Tulane University of Louisiana School of Medicine, New Orleans, $750,000; Western Reserve University School of Medicine, Cleveland, $1,000,000; University of Chicago School of Medicine, $500,000; University of Southern California School of Medicine, Los Angeles, $300,000; Yale University School of Medicine, New Haven, Conn., $750,000. The Commonwealth Fund, established in 1918 by Mrs. Stephen V. Harkness, "to do something for the welfare of mankind," is continuing the study of other medical schools in line with this announced policy.

National Medical Fellowships.—The National Medical Association announces the availability of fellowships, scholarships, and loans to Negro candidates who are citizens of the United States. Loans are made to applicants who have received the M.D. degree and who wish to continue in training in a specialty with the ultimate purpose of attaining board certification. Generally these loans are $1,500 or less; application may be made for renewal of the loan. Under unusual circumstances a fellowship instead of a loan may be awarded in this category. Fellowships for advanced training are awarded (*a*) when a candidate is of outstanding quality; (*b*) when he is preparing himself for teaching responsibilities or for research in a teaching department or for leadership in a program of community health care; (*c*) when he has a definite appointment of this sort or an excellent prospect of receiving one on completion of his fellowship; and generally (*d*) when the training he receives will aid in the development of a particular school whose educational objectives seem sound. Fellowships in pediatrics, orthopedics, and neurology are awarded by the National Foundation for Infantile Paralysis on recommendation by National Medical Fellowships, Inc., and are administered by the foundation. Fellowships in the other branches of medicine and surgery are awarded by National Medical Fellowships, Inc., from funds provided by the Commonwealth Fund and are designated as "Fellowships for Advanced Training (Commonwealth Fund)." Application blanks may be secured from Mrs. Hilde Reitzes, Executive Secretary, National Medical Fellowships, Inc., 951 E. 58th St., Chicago 37. Completed applications must be received by March 1.

Society News.—Officers of the **American Hospital Association** include: Mr. Ray E. Brown, president; Dr. Albert W. Snoke, New Haven, Conn., president-elect; and Mr. John N. Hatfield, Chicago, treasurer.——Newly elected officers of the **Baltimore-Washington Dermatological Society** include: Dr. Eugene S. Bereston, Baltimore, president; Col. Franklin H. Grauer, M. C., Washington, D. C., vice-president; and Dr. Arnold H. Gould, Washington, D. C., secretary-treasurer.——Officers of the **Joint Commission on Mental Illness and Health, Inc.**, include: Dr. Kenneth E. Appel, Philadelphia, president; M. Brewster Smith, Ph.D., New York, vice-president; Mr. Charles Schlaifer, secretary-treasurer; and Dr. Leo H. Bartemeier, Baltimore, chairman of the board of trustees.——Officers of the **American College of Gastroenterology** include: Dr. James T. Nix, New Orleans, president; Dr. Arthur A. Kirchner, Los Angeles, president-elect; Drs. C. Wilmer Wirts, Philadelphia, Frank J. Borrelli, New York, Joseph Shaiken, Milwaukee, and Henry Baker, Boston, vice-presidents; and Dr. Theodore S. Heineken, Bloomfield, N. J., secretary.——Officers of the **American Congress of Physical Medicine and Rehabilitation** include: Dr. Gordon M. Martin, Rochester, Minn., president; Dr. Alvin B. C. Knudson, Washington, D. C., president-elect; Drs. Donald L. Rose, Kansas City, Kan., Arthur C. Jones, Portland, Ore., Frederic J. Kottke, Minneapolis, Donald A. Covalt, New York, and Donald J. Erickson, Rochester, Minn., vice-presidents; Dr. Frances Baker, San Mateo, Calif., secretary; and Dr. Frank H. Krusen, Rochester, Minn., treasurer. At its meeting in Atlantic City, Sept. 10-14, the congress awarded gold keys for distinguished service to: (1) Dr. Walter M. Solomon, posthumously; (2) Dr. Robert L. Bennett, Warm Springs, Ga.; and (3) Dr. Earl C. Elkins, Rochester, Minn. Dr. Shyh-Jong Yue, New York City, won the annual essay award for his paper "Arthroplasty of the Hip, Its Pre- and Post-Operative Management."——Newly elected officers of the **American Heart Association** include: Dr. Irvine H. Page, Cleveland, president; Dr. Edgar V. Allen, Rochester, Minn., president-elect; and Drs. Eugene B. Ferris, Atlanta, Ga., Louis E. Martin, Los Angeles, and David D. Rutstein and Robert W. Wilkins, Boston, vice-presidents.——Officers of the **American Board of Anesthesiology** include Dr. Rolland J. Whitacre, Cleveland, president; Dr. Donald L. Burdick, New York, vice-president; and Dr. Curtiss B. Hickcox, Hartford, Conn., secretary-treasurer.

CORRECTIONS

Manual for Artificial Respiration.—In the article "A New Method of Manual Artificial Respiration for Infants and Small Children" in The Journal, Oct. 22, 1955, in the last line of the right-hand column, page 761, (fig. 2*A*) should have been (fig. 3*A*).

Dysmenorrhea.—In the query entitled "Dysmenorrhea" in The Journal, Oct. 22, 1955, page 829, in the 10th from the last line, it is stated that "pain does not occur with an ovulatory cycle." This passage should have read "pain does not occur with an anovulatory cycle."

MEETINGS

AMERICAN MEDICAL ASSOCIATION: Dr. George F. Lull, 535 North Dearborn St., Chicago 10, Secretary.

1956 Annual Meeting, Chicago, June 11-15.

1956 Clinical Meeting, Seattle, Nov. 27-30.

1957 Annual Meeting, New York, June 3-7.

1957 Clinical Meeting, Philadelphia, Dec. 3-6.

1958 Annual Meeting, San Francisco, June 23-27.

Annual Congress on Industrial Health, Sheraton-Cadillac Hotel, Detroit, Jan. 23-24. Mr. Clark D. Bridges, 535 N. Dearborn St., Chicago 10, Acting Secretary.

Annual Congress on Medical Education and Licensure, Palmer House, Chicago, Feb. 11-14. Dr. Edward L. Turner, 535 North Dearborn St., Chicago 10, Secretary.

American Academy of Allergy, Chase Hotel, St. Louis, Feb. 6-8. Dr. Francis C. Lowell, 65 East Newton St., Boston, Secretary.

American Academy of Orthopaedic Surgeons, Palmer House, Chicago, Jan. 28-Feb. 2. Dr. John R. Norcross, 122 South Michigan Blvd., Chicago 3, Secretary.

American College of Radiology, Drake Hotel, Chicago, Feb. 10-11. Mr. William C. Stronach, 20 North Wacker Drive, Chicago 6, Executive Secretary.

American Society for Surgery of the Hand, Chicago, Jan. 27. Dr. George V. Webster, 1145 East Green St., Pasadena 1, Calif., Secretary.

Eastern Section, American Laryngological, Rhinological and Otological Society, Boston, Jan. 13. Dr. John A. Murtagh, Dartmouth College, Hanover, N. H., Vice President.

Los Angeles Midwinter Medical Convention, Biltmore Hotel, Los Angeles, Jan. 3-5. Dr. Paul D. Foster, 1925 Wilshire Blvd., Los Angeles 58, General Chairman.

Medical Society Executives Conference, Drake Hotel, Chicago, Feb. 6-8. Mr. H. Martin Baker, 1102 South Hillside, Wichita 17, Kansas, Secretary.

Middle Section, American Laryngological, Rhinological and Otological Society, Netherland Plaza, Cincinnati, Jan. 16. Dr. William H. Craddock, 2328 Auburn Ave., Cincinnati 19, Vice President.

Neurosurgical Society of America, Hotel Key Biscayne, Key Biscayne, Miami, Fla., Jan. 18-21. Dr. Lester A. Mount, 700 West 168th St., New York 32, Secretary.

Northwest Society for Clinical Research, University of Oregon Medical School, Portland, Ore., Jan 21. Dr. Arthur L. Rogers, 1216 S.W. Yamhill St., Portland 5, Ore., Secretary.

Regional Meetings, American College of Physicians:

- Shreveport, La., Jan. 14. Dr. M. D. Hargrove, 803 Jordan St., Shreveport, La., Governor.
- Philadelphia, Jan. 20. Dr. Thomas M. McMillan, 330 South 9th St., Philadelphia 7, Governor.
- Saskatoon, Sask., Feb. 3-4. Dr. C. H. A. Walton, Winnipeg Clinic, Winnipeg, Man., Canada, Governor.
- Tucson, Ariz., Feb. 11. Dr. Leslie R. Kober, 15 East Monroe St., Phoenix, Ariz., Governor.

Sectional Meetings, American College of Surgeons:

Jacksonville, Fla., Hotel George Washington, Jan. 16-18. Dr. Kenneth A. Morris, 2522 Oak St., Jacksonville 4, Fla., Chairman.

Society of University Surgeons, Hotel Claypool, Indianapolis, Feb. 8-10. Dr. C. Rollins Hanlon, 1325 South Grand Blvd., St. Louis 4, Secretary.

South Atlantic Association of Obstetricians and Gynecologists, Hollywood Beach Hotel, Hollywood, Fla., Jan. 28-Feb. 1. Dr. C. H. Mauzy, Bowman Gray School of Medicine, Winston-Salem, N. C., Secretary.

Southern Section, American Federation for Clinical Research, Jung Hotel, New Orleans, Jan. 20. *Dr. John H. Moyer, 1200 M.D. Anderson Blvd.*, Houston, Texas, Secretary.

Southern Section, American Laryngological, Rhinological and Otological Society, The Shamrock, Houston, Texas, Jan. 27-28. Dr. J. M. Robison, 1304 Walker Ave., Houston 2, Texas, Chairman.

Western Section, American Federation for Clinical Research, Golden Bough Theater, Carmel, Calif., Jan. 26. Dr. Charles M. Grossman, 301 Selling Bldg., Portland 5, Ore., Secretary.

Western Section, American Laryngological, Rhinological and Otological Society, County Medical Society Bldg., San Francisco, Jan. 21. Dr. David D. DeWeese, 1216 S. W. Yamhill St., Portland, Ore., Vice President.

Western Society for Clinical Research, Carmel-by-the-Sea, Calif., Jan. 27-28. Dr. Arthur J. Seaman, University of Oregon Medical School, Portland 1, Ore., Secretary.

FOREIGN AND INTERNATIONAL

All India Medical Conference, Jaipur, India, Dec. 26-28. Dr. B. N. Consul, Association Bldg., S.M.S. Hospital Premises, Jaipur, India, Organizing Secretary.

Canadian Medical Association, Quebec, P. Q., Canada, June 10-14, 1956. Dr. Arthur D. Kelly, 150 St. George St., Toronto 5, Ont., Canada, Secretary.

Conference of International Union for Health Education of the Public, Rome, Italy, April 27-May 5, 1956. Mr. Lucien Viborel, 92 rue St. Denis, Paris 1^{er}, France, Secretary-General.

Congress of International Anesthesia Research Society, Miami Beach, Fla., U.S.A., April 9-12, 1956. For information write: Dr. R. J. Whitacre, 13951 Terrace Road, Cleveland 12, Ohio, U. S. A.

Congress of International Association of Limnology, Helsinki, Finland, July 26-Aug. 7, 1956. For information address: Dr. H. Luther, Snellmansgatan 16 C 36, Helsinki, Finland.

Congress of International Association of Logopedics and Phoniatrics, *Barcelona, Spain, Sept. 3-7, 1956. Dr. J. Perello, Provenza 319, Barcelona 9, Spain, Secretary-General.*

Congress of International Society of Hematology, Hotel Somerset, Boston, Mass., U.S.A., Aug. 27-Sept. 1, 1956. Dr. W. C. Moloney, 39 Bay State Road, Boston, Mass., U.S.A., Secretary.

Congress of Latin Society of Ophthalmology, Madrid, Spain, April 24-28, 1956. For information address: Dr. Costi, Montalban 3, Madrid, Spain.

European Congress of Allergology, Florence, Italy, Sept. 12-15, 1956. Prof. Umberto Serafini, Instituto de Patologia Medica, Viale Morgagni, Florence, Italy, Secretary-General.

European Congress of Cardiology, Stockholm, Sweden, Sept. 10-14, 1956. Dr. Karl Erik Grewin, Sodersjukhuset, Stockholm, Sweden, General Secretary.

European Symposium on Vitamin B_{12}, Hamburg, Germany, May, 1956. For information write: Doz. Dr. H. Bauer, Nervenklinik, Hamburg-Eppendorf, Germany.

Inter-American Congress of Cardiology, Havana, Cuba, Nov. 4-10, 1956. For information address: Dr. Ramon Aixala, Apartado 2108, Havana, Cuba.

International Academy of Pathology, Cincinnati, Ohio, U. S. A., April 24-25, 1956. Dr. F. K. Mostofi, Armed Forces Institute of Pathology, Washington 25, D. C., U. S. A., Secretary.

International Congress Against Alcoholism, Istanbul, Turkey, Sept. 10-15, 1956. For information address: International contre l'Alcoolisme, Case Gare 49, Lausanne, Switzerland.

International Congress on Animal Reproduction, Arts School, University of Cambridge, Cambridge, England, June 25-30, 1956. Dr. Joseph Edwards, Production Division, Milk Marketing Board, Thames Ditton, Surrey, England, Hon. Secretary.

International Congress of Anthropological and Ethnological Sciences, Philadelphia, Pa., U. S. A., Sept. 2-9, 1956. Dr. William N Fenton, National Research Council, Division of Anthropology and Psychology, 2101 Constitution Avenue, Washington 25, D. C., U. S. A., Secretary-General.

International Congress of Dietetics, Congress Palace, Esposizione Universale Roma, Rome, Italy, Sept. 10-14, 1956. Prof. E. Serianni, Associazione Dietetica, Italiana, via dei Penitenzieri N. 13, Rome, Italy, Secretary General.

International Congress on *Diseases of the Chest, Cologne, Germany,* Aug. 19-23, 1956. Mr. Murray Kornfeld, 112 East Chestnut St., Chicago 11, Illinois, U. S. A., Executive Director.

International Congress of *Entomology*, Montreal, Canada, Aug. 17-25, 1956. Mr. J. A. Downes, Science Service Bldg., Carling Ave., Ottawa, Ont., Canada, Secretary.

International Congress of Gastroenterology, London, England, July 18-21, 1956. Mr. Hermon Taylor, London Hospital, White Chapel, *London E.1, England, Honorable Secretary.*

International Congress for the History of Science, Florence and Milan, Italy, Sept. 3-10, 1956. Dr. M. L. Bonelli, Instituto di Ottica, Arcetri, Florence, Italy, Secretary-General.

International Congress of Hydatid Disease, Athens, Greece, Sept. 14-18, 1956. Prof. B. Kourias, Croix-Rouge Hellenique, 1 rue Mackenzie King, Athens, Greece, Secretary-General.

International Congress of Internal Medicine, Madrid, Spain, Sept. 19-23, 1956. Dr. J. C. De Oya and Dr. J. Gimena, Hostaleza No. 90, *Madrid, Spain, Secretaries.*

International Congress of International College of Surgeons, Palmer House, Chicago, Illinois, U. S. A., Sept. 9-13, 1956. Dr. Max Thorek, 1516 Lake Shore Drive, Chicago, Illinois, U. S. A., Secretary-General.

International Congress of Neo-Hippocratic Medicine, Montecatini, Terme, Italy, May 20-22, 1956. Dr. Valente, 41 Avenue Verdi, Montecatini Terme, Italy, Secretary-General.

International Congress *of Paediatrics*, Copenhagen, Denmark, July 22-27, 1956. Professor P. Plum, Rigshospitalet, Copenhagen, Denmark, President.

International Congress of Physical Medicine, Copenhagen, Denmark, August 20-24, 1956. Dr. B. Strandberg, Kobenhavns *amts sygehus i* Gentofte, Dept. of Rheumatology and Physical Medicine, Hellerup, Denmark, Honorable Secretary.

International Congress of Radiology, Mexico, D. F., Mexico, July 22-28, 1956. Dr. Jose Noriega, Tepic 126 (2e piso), Mexico, D. F. 7, Mexico, Secretary General.

International Congress of World Confederation for *Physical* Therapy, Hotel Statler, New York, New York, U. S. A., June 17-23, 1956. For information address: Miss Mildred Elson, American Physical Therapy Association, 1790 Broadway, New York 19, New York, U. S. A.

International Genetics Symposium, Tokyo and Kyoto, Japan, Sept. 6-12, 1956. For information address: Secretary, International Genetics Symposium, Science Council of Japan, Ueno Park, Tokyo, Japan.

International Physiological Congress, Brussels, Belgium, July 29-*Aug. 5, 1956. For information address: Prof. J. Reuse, Faculte de* Medicine et de Pharmacie, 115 Boulevard de Waterloo, Brussels, Belgium.

International Professional Union of Gynecologists and Obstetricians, Madrid, Spain, Sept. 28-29, 1956. Dr. Jacques Courtois, 1 rue Racine, St-Germain-en-Laye (S and O), France, Permanent International Secretary-General.

Latin American Congress of Physical Medicine, San Juan, Puerto Rico and Curacao, N.W.I., Jan. 29-Feb. 8, 1956. Dr. Cassius Lopez de Victoria, 176 East 71st St., New York 21, New York, U. S. A., Executive Director.

Medical Women's International Association, Extraordinary General Assembly, Burgenstock, Nidwalden, Switzerland, Sept. 21-23, 1956. Dr. Janet Aitken, 30a Acacia Road, London N.W. 1, England, Secretary.

National Congress of Pediatrics, Cuidad Universitaria, Mexico D.F., Mexico, May 1-5, 1956. Dr. Ignacio Avila Cisneros, Calzada de Madereros No. 240, Mexico 18, D.F., Mexico, Coordinator.

North Queensland Medical Conference, Cairns, North Queensland, Australia, June 25-30, 1956. Dr. W. R. Horsfall, P. O Box 672, Cairns, N.Q., Australia, Secretary.

Pan-American Academy of General Practice, San Juan, Puerto Rico and Curacao, N.W.I., Jan. 29-Feb. 8, 1956. Dr. Arturo Martinez, 54 East 72d St., New York 21, New York, U. S. A., Secretary.

Pan American Congress of Gastroenterology, Havana, Cuba, Jan. 20-27, 1956. For information address: Dr. Norberto M. Stapler, 1267 J. E. Uriburu, Buenos Aires, Argentine, S. A.

Pan American Congress of Ophthalmology, Santiago, Chile, S. A., Jan. 9-14, 1956. Dr. Rene Contardo, Huerfanos 930, Of. 74, Santiago, Chile, Secretary General.

Pan American Congress of Otorhinolaryngology and Bronchoesophagology, San Juan, Puerto Rico, April 8-12, 1956. Dr. C. E. Munoz MacCormick, Apartado 9111, Santurce 29, Puerto Rico, Secretary General.

Pan American *Medical* Women's Alliance, Santiago, Chile, March 6-13, 1956. For information address: Dr. Eva Cutright, 458 Beall Ave., Wooster, Ohio, U. S. A.

World Congress on Fertility and Sterility, Naples, Italy, May 18-26, 1956. For information address: Prof. G. Tesauro, S. Andrea della Dame, 19, Naples, Italy.

World Medical Association, Havana, Cuba, Oct. 9-15, 1956. Dr. Louis H. Bauer, 345 East 46th St., New York 17, New York, *U. S. A.*, Secretary-General.

EXAMINATIONS AND LICENSURE

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: Various Centers. April 24-25 (Part II); June 19-20 (Parts I and II); September 4-5 (Part I). Candidates may file applications at any time but they must be received at least six weeks before the date of the examination for which application is made. New candidates should apply by formal registration; registered candidates may notify the board, indicating desired location, date and candidate number. Ex. Sec., Dr. John P. Hubbard, 133 South 36th St., Philadelphia 4.

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination* Montgomery, June 19-21. Sec., Dr. D G. Gill, State Office Bldg., Montgomery.

Arizona:* *Examination.* Phoenix, Jan. 18-19. *Reciprocity.* Phoenix, Jan. 21. Sec., Dr. M. R. Richter, 411 Security Bldg., Phoenix.

Delaware: *Examination.* Dover, Jan. 10-12. *Reciprocity.* Dover, Jan. 19. Sec., Dr. Joseph S. McDaniel, Dover.

Georgia: *Examination and Reciprocity.* Atlanta, June. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

Idaho: *Examination and Reciprocity.* Boise, Jan. 9-11. Exec. Sec., Mr. Armand L. Bird, 364 Sonna Bldg., Boise.

Illinois: *Examination and Reciprocity.* Chicago, Jan. 24-26. Supt. of Regis., Mr. Frederic B. Selcke, Capitol Building, Springfield.

Indiana: *Examination.* Indianapolis, June. Exec. Sec., Miss Ruth V. Kirk, 538 K. of P. Bldg., Indianapolis.

Maine: *Examination.* Portland, Mar. 13-14. Sec., Dr. Adam P. Leighton, 192 State St., Portland.

Michigan:* *Examination.* Ann Arbor and Detroit, June 13-15 (Tentative). Sec., Dr. E. C. Swanson, 118 Stevens T. Mason Bldg., Lansing.

Minnesota:* *Examination.* Minneapolis, Jan. 18-20. Sec., Dr. F. H. Magney, 230 Lowry Medical Arts Bldg., St. Paul 2.

Montana: *Examination and Reciprocity.* Helena, April 3-4. Sec., Dr. S. A. Cooney, 7 West 6th Ave., Helena.

Nebraska:* *Examination.* Omaha, June 18-20. Director, Bureau of Examining Boards, Mr. Husted K. Watson, 1009 State Capitol Bldg., Lincoln.

Nevada:* *Examination and Reciprocity.* Reno, Jan. 3. Sec., Dr. G. H. Ross, 112 N. Curry St., Carson City.

New Hampshire: *Examination and Endorsement.* Concord, March 14. Sec., Dr. John S. Wheeler, 107 State House, Concord.

New York: *Examination.* Albany, Buffalo, Syracuse and New York, Feb. 7-10. Sec., Dr. Stiles D. Ezell, 23 S. Pearl St., Albany.

North Carolina: *Reciprocity.* Durham, Jan. 16. Sec., Dr. Joseph J. Combs, Professional Bldg., Raleigh.

North Dakota: *Examination.* Grand Forks, Jan. 4-6. *Reciprocity.* Grand Forks, Jan. 7. Sec., Dr. C. J. Glaspel, Box 228, Grafton.

Oklahoma:* *Examination.* Oklahoma City, June 5-6. Sec., Dr. E. F. Lester, 813 Braniff Bldg., Oklahoma City.

Oregon:* *Examination.* Portland, Jan. 16-17. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg., Portland.

Pennsylvania: *Examination.* Philadelphia, January. Acting Sec., Miss Marguerite G. Steiner, Box 911, Harrisburg.

Rhode Island:* *Examination.* Providence, Jan. 5-6. Admin. of Professional Education, Mr. Thomas B. Casey, Room 366, State Office Bldg., Providence 2.

South Dakota:* *Examination.* Sioux Falls, Jan. 17-18. Exec. Sec., Mr. John C. Foster, 300 First National Bank Bldg., Sioux Falls.

Tennessee:* *Examination.* Memphis, Dec. 21-22. Sec., Dr. H. W. Qualls, 1635 Exchange Bldg., Memphis.

Washington:* *Examination.* Seattle, Jan. 9-11. *Reciprocity.* Seattle, Jan. 8. Secretary, Department of Licenses, Mr. Edward C. Dohm, Olympia.

West Virginia: *Examination and Reciprocity.* Charleston, Jan. 9-11. Sec., Dr. Newman H. Dyer, State Office Bldg., No. 3, Charleston 5.

Wisconsin:* *Reciprocity and Examination.* Madison, Jan. 10-12; *Reciprocity,* Madison, Spring; *Reciprocity and Examination.* Milwaukee, July 10-12. Sec., Dr. Thomas W. Tormey, Jr., 1140 State Office Bldg., Madison.

Wyoming: *Examination and Endorsement.* Cheyenne, Feb. 6. Sec., Dr. Franklin D. Yoder, State Office Bldg., Cheyenne.

Alaska:* On application. Sec., Dr. W. M. Whitehead, 172 South Franklin St., Juneau.

Guam. *Endorsement.* Agana, Jan. 2. The Commission on Licensure will meet whenever a candidate appears or submits his credentials. Sec., Dr. John E. Kennedy, Agana.

Hawaii: *Examination.* Honolulu, Jan. 9-12. Sec., Dr. I. L. Tilden, 1020 Kapiolani, St., Honolulu.

Puerto Rico: *Examination.* San Juan, Mar. 6-11. Sec., Dr. Joaquin Mercado Cruz, Box 3271, San Juan.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Arizona: *Examination and Reciprocity.* Tucson, Dec. 20. Sec., Dr. H. D. Rhodes, University of Arizona, Tucson.

Arkansas: *Examination.* Little Rock, May 4-5. Sec., Mr. S. C. Dellinger, Zoology Department, University of Arkansas, Fayetteville.

Connecticut: *Examination.* New Haven, Feb. 11. Address: State Board of Healing Arts, 258 Bradley St., New Haven 10.

District of Columbia: *Examination.* Washington, April 23-24. Deputy Director, Mr. Paul Foley, 1740 Massachusetts Ave. N.W., Washington 6.

Iowa: *Examination.* Des Moines, Jan. 10. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: *Examination.* Detroit and Ann Arbor, Feb. 10-11. Sec., Mrs. Anne Baker, 410 W. Michigan Ave., Lansing 15.

Minnesota: *Examination.* Minneapolis, Jan. 3-4. Sec., Dr. Raymond N. Bieter, 126 Millard Hall, University of Minnesota, Minneapolis.

Nebraska: *Examination.* Omaha, Jan. 10-11. Sec., Mr. Husted K. Watson, Room 1009, State Capitol Bldg., Lincoln 9.

Nevada: *Examination.* Reno, Jan. 3. Sec., Dr. Donald G. Cooney, Box 9005, University Station, Reno.

New Mexico: *Examination.* Santa Fe, Jan. 15. Sec., Mrs. Marguerite Cantrell, Box 1522, Santa Fe.

Oklahoma: *Examination.* Oklahoma City, Mar. 30-31. Sec., Dr. E F. Lester, 813 Braniff Bldg., Oklahoma City.

Oregon: *Examination.* Portland, March 3; June 2, Sept. 8 and Dec. 1. Dr. Earl M. Pallett, Sec., State Board of Higher Education, Eugene.

Tennessee: *Examination.* Memphis, Dec. 30-31. Sec., Mr. O. W. Hyman, 62 S. Dunlap St., Memphis 3.

Texas: *Examination.* Galveston, Dallas, and such other locations as are warranted, April. Sec., Bro. Raphael Wilson, 407 Perry-Brooks Bldg., Austin.

Washington: *Examination.* Seattle, Jan. 4-5. Secretary, Department of Licenses, Mr. Edward C. Dohm, Olympia.

Wisconsin: Madison, Apr. 7. Final date for filing application is Mar. 30. Sec., Dr. W. H. Barber, 621 Ransom St., Ripon.

Alaska: On application. Juneau or other towns in Territory as decided by Board. *Reciprocity.* On application. Sec., Dr. C. Earl Albrecht, Box 1931, Juneau.

---

*Basic Science Certificate required.

MAGAZINE–TELEVISION REPORT

The following list of current medical articles in mass-circulation magazines and forthcoming network television programs on medical subjects is published each week only for the information of readers of The Journal. *Unless specifically stated, the American Medical Association neither approves nor disapproves of the articles and programs reported.*

TELEVISION

Monday, Dec. 26

NBC-TV, 11 a. m.-12 noon EST. "Medical and Health News with Howard Whitman," a segment of the "Home" show.

NBC-TV, 9 p. m. EST. "Medic" tells the story of aviation medicine and of Dr. William Lovelace, the Army doctor who parachuted from a plane eight miles above the earth to test the effects of high altitude jumps on the human system.

ABC-TV, 9:30 p. m. EST. "Medical Horizons" takes its remote camera to New York University-Bellevue Medical Center to show how infectious diseases are cared for in a general hospital.

MAGAZINES

Life, Dec. 3, 1955

"Comfort as Sorrow Comes"

A photo-text article on the plan used by the City of Hope Medical Center, Los Angeles, to help parents whose children are doomed with leukemia. Mothers and fathers are put to work in the hospital wards.

Town Journal, December, 1955

"To the Hospital A-Flyin'," by Leverett G. Richards

Residents of Medford, Ore., sponsor a nonprofit air ambulance to fly patients to Portland when big city hospital facilities are needed.

Ladies Home Journal, December, 1955

"Better Health for Babies," by Margaret Hickey

The Child Health Association, a major project of the Spokane Junior League, maintains a well-baby clinic, with the help of pediatricians who donate their time. Of some 2,000 infants and preschool children examined last year, nearly half were found to have defects ranging from eczema to mental retardation.

GOVERNMENT SERVICES

AIR FORCE

Appoint Assistant for Reserve Affairs.—The surgeon general has announced that Col. Paul Goodwin, M. C., U. S. A. F., has been named assistant for reserve affairs. Formerly Colonel Goodwin was wing surgeon of the Alabama Air National Guard's 117th tactical reconnaisance wing. His career as a citizen soldier dates back to 1925 in the citizens military training corps, followed by reserve officer training at Georgetown College, Washington, D. C., and the medical ROTC at Georgetown University School of Medicine. He entered active duty as a major in the Medical Corps in 1941 and served in the U. S. and South Pacific during the war. He was separated in 1946 from the First Air Force with a rank of lieutenant colonel. An active reservist since then, he was the first U. S. Medical Reserve officer to complete extension courses of the command and general staff course, Medical Field Service School, and of the economic mobilization course, Industrial College of the Armed Forces. He is a graduate of the field officer course of the Air University Extension Course Institute, and recently took a special course for civil defense administrators at the National Civil Defense Training Center in Maryland.

ARMY

Major General Martin Retires.—Major Gen. Joseph I. Martin, M. C., retired from the Army Nov. 30 after over 37 years' service. General Martin recently completed a tour of duty as chief surgeon of the U. S. Army Forces, Europe. For the past year he served as president of the association of military surgeons of the United States. He is a recipient of the Distinguished Service medal, the Legion of Merit, and of decorations for distinguished service from seven foreign nations.

NAVY

Clinical Clerkship and Senior Student Program for Ensigns.—Second and third year medical students commissioned as ensigns, 1995 U. S. N. R., are eligible for up to 60 days' active duty for training, with full pay and allowances of their rank while so serving at any teaching naval hospital designated by the chief, bureau of medicine and surgery. Commencing July 1 of each year, this clinical clerkship program is available to the medical student during his vacation from medical school. It provides orientation into naval medicine, rotation through the major professional services, and performance of on-the-job training duties at a naval teaching hospital. Each officer is eligible for only one tour of this duty during his tenure as an ensign, 1995 (medical) U. S. N. R.

Third year medical students who expect to qualify for acceptance into their final year of medical school and who wish to avail themselves of the Navy's new senior medical student program should make application prior to Feb. 1, 1956; applications for this program will not be accepted after that date.

Ensigns, 1995 (medical), availing themselves of this senior medical student training and accepting an appointment in the regular Navy, will be obligated to serve on active duty for a minimum period of three years, excluding the period served as a senior medical student and in a naval internship. Applications for ensign, 1995 (medical) U. S. N. R., and the senior medical student program are currently being processed.

Elect President of Military Surgeons.—The Association of Military Surgeons of the United States on Nov. 9, 1955, elected Rear Adm. Winfred P. Dana, M. C., U. S. Navy, president of that association to succeed Major Gen. Joseph I. Martin, M. C., U. S. Army.

Retirements.—The following Medical Corps officers were placed on the retired list Oct. 1, 1955: Rear Adm. Leslie O. Stone, Rear Adm. Albert T. Walker, and Capt. Anton Zikmund.

VETERANS ADMINISTRATION

Personal.—Dr. Endre K. Brunner, manager of the VA hospital in Manchester, N. H., has been appointed manager of the VA hospital in the Bronx, N. Y., succeeding Dr. John G. Hood, who was named area medical director for VA with headquarters in Columbus, Ohio.

The Veteran Population.—The statistical summary of veterans' activities shows that the number of veterans in civil life at the end of October was 22,051,000, an increase of 42,000 since October, 1954. The average daily load of patients was given as 113,736, of which 110,356 were in VA hospitals and the remaining 3,380 in non-VA hospitals. There was given also an average daily member load of veterans of all wars under domiciliary care of 17,206, an increase of 346 under domiciliary care since October, 1954. At the end of October, 1955, there were five new VA hospitals under construction. A total of 61 new VA hospitals had been completed up to the end of that month.

PUBLIC HEALTH SERVICE

Appoint Reserve Officers.—The Public Health Service announced on Dec. 3 the appointment of 86 physicians, nurses, sanitary engineers, dentists, and pharmacists to the inactive reserve of its commissioned officer corps. The new officers are among the most recent of the nation's professional health specialists to be appointed under the service's program to expand its commissioned reserve by organizing and training health and medical personnel throughout the country and its territories for emergency duty in times of national crisis. Officers of the commissioned reserve are trained to serve in critical situations affecting the health and well-being of large numbers of people. These officers will serve in the capacities for which their professional training and experience have fitted them. They will be called out principally to reinforce the staffs of official state and local health agencies and to augment the Public Health Service operating staff.

MISCELLANEOUS

Postdoctoral Fellowships in Science.—The National Science Foundation plans to award in 1956 about 40 senior postdoctoral fellowships to individuals planning additional study and/or research. The purpose is to provide an opportunity for individuals several years past the doctoral degree to supplement their training; the fellowships are therefore not thought of as designed to provide support for research projects as such. National Science Foundation senior postdoctoral fellowships are available to citizens of the United States who have demonstrated special aptitude for advanced training and productive scholarship and who have held a doctoral degree in one of the fields of basic science for a minimum of five years, or who have had the equivalent in research experience and training.

Annual awards for senior postdoctoral fellows are of the salary-matching type. No award, however, will be less than $4,000 per annum before adjustment and none will exceed $10,000 per annum. An allowance will be paid to aid in defraying the costs of travel undertaken in the fulfillment of the fellowship study plan. An additional allowance may be made to defray costs of tuition, fees, unusual research expenses, special equipment, and special travel in an amount not to exceed $600 for each full year of tenure. A National Science Foundation fellow is required to devote full time to scientific study or scientific research during the tenure of his fellowship. Applicants must submit transcripts of their college and university records, and a plan of study containing justification of the tenure desired and any unusual travel plans. The affidavit and loyalty oath required by section 15 (d) of the National Science Foundation Act, 42 U. S. C. 1874 (d) will constitute part of the application.

A fellow may pursue his fellowship at any accredited nonprofit institution of higher education approved by the National Science Foundation. Application materials may be obtained from the Division of Scientific Personnel and Education, National Science Foundation, Washington 25, D. C. Completed materials must be received not later than Jan. 16, 1956. Fellowships will be awarded on March 20, 1956.

DEATHS

Smith, James Washington ⊕ New York City; born in Washington, D. C., May 16, 1893; University and Bellevue Hospital Medical College, New York City, 1917; clinical professor of ophthalmology at the Post-Graduate Medical School of the New York University-Bellevue Medical Center; served on the faculty of his alma mater; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Otolaryngology and the Association for Research in Ophthalmology; fellow of the American College of Surgeons and the New York Academy of Medicine; past-president of the New York Society of Clinical Ophthalmology; past-president and secretary of the New York University College of Medicine Alumni; in June, 1935, New York University presented him with the Alumni Meritorious Service award; vice-president of the board of trustees of Phi Delta Epsilon; served during World War I; since 1933 a member of the board of visitors at Rockland State Hospital, Orangeburg; on the staffs of the Hospital for Joint Diseases, Goldwater Hospital, Nyack (N. Y.) Hospital, and University Hospital; died in the New York Hospital Oct. 24, aged 62, of coronary thrombosis.

Shipley, Arthur Marriott, Baltimore; born in Harmans, Md., Jan. 8, 1878; University of Maryland School of Medicine, Baltimore, 1902; professor of surgery emeritus at his alma mater, now known as the University of Maryland School of Medicine and College of Physicians and Surgeons, where he was at one time associate professor of surgery, professor of clinical surgery, and for many years professor of surgery and head of the department; served in France during World War I; member of the founders group of the American Board of Surgery; past-president of the Medical and Chirurgical Faculty of Maryland and the Baltimore City Medical Society; member and at one time vice-president of the American Surgical Association; an associate member of the American Medical Association; member of the Southern Surgical Association and the American Association for Thoracic Surgery; fellow of the American College of Surgeons; served as consultant for the city health department; superintendent of the University of Maryland Hospital from 1904 to 1908 and later surgeon-in-chief; surgeon-in-chief for the Baltimore City Hospital for many years; died Oct. 16, aged 77, of arteriosclerotic heart disease.

Chesley, Albert Justus ⊕ Minneapolis; born in Minneapolis Sept. 12, 1877; University of Minnesota College of Medicine and Surgery, Minneapolis, 1907; joined the laboratory service of the Minnesota State Board of Health in 1902, serving in this capacity until 1910, when he became epidemiologist, later director of the division of epidemiology, director of the division of preventable diseases, and since 1921 secretary and executive officer; clinical professor emeritus of public health (public health administration and epidemiology) at his alma mater, now known as the University of Minnesota Medical School; past-president of the American Public Health Association; past-president and for many years secretary of the Conference of State and Provincial Health Authorities of North America; member of the Veterans of Foreign Wars and Nu Sigma Nu; veteran of the Spanish-American War; served as public health expert to the American Red Cross in France and in Poland, where he was chief of staff and commissioner from 1918 to 1920; specialist certified by the American Board of Preventive Medicine; died in the Mayo Clinic, Rochester, Minn., Oct. 17, aged 78, of coronary thrombosis.

Moncure, Philip St. Leger ⊕ Norfolk, Va.; born in Ruther Glen in 1867; Medical College of Virginia, Richmond, 1897; fellow of the American College of Surgeons; past-president of the Norfolk County Medical Society and the Medical Society of Virginia; member of the House of Delegates of the American Medical Association in 1935; charter member of the Seaboard Medical Association; for many years member of the state board of medical examiners; served on the staffs of Norfolk General, DePaul, and Leigh Memorial hospitals; died in Ruther Glen, his ancestral home in Caroline County, Sept. 24, aged 88, of cerebral hemorrhage.

Barker, Myron Joseph ⊕ Lakewood, Ohio; Western Reserve University School of Medicine, Cleveland, 1935; served during World War II; on the staffs of the Lakewood (Ohio) Hospital and the Lutheran, St. John's, and Fairview Park hospitals in Cleveland; died Oct. 1, aged 45, of coronary occlusion.

Berry, George W., Moundville, Mo.; Medico-Chirurgical College of Kansas City, 1903; served as coroner of Bates County; died in the Nevada City (Mo.) Hospital July 29, aged 86, of cardiac decompensation and chronic myocardosis.

Bethea, William Spinks ⊕ Latta, S. C.; Medical College of the State of South Carolina, Charleston, 1936; fellow of the American Academy of General Practice; three times president of the Dillon County Medical Association; past-president of the Pee Dee Medical Association; served during World War II; chief and past-president of the staff of St. Eugene Hospital in Dillon; died Aug. 24, aged 42, in an automobile accident.

Birbeck, Albert Franklin, Longview, Wash.; McGill University Faculty of Medicine, Montreal, Canada, 1924; served with the Canadian Army during World War I; on the staff of the Cowlitz General Hospital and St. John's Hospital; died Sept. 27, aged 57, of coronary thrombosis.

Bond, Russell Conwell ⊕ Wheeling, W. Va.; Washington University School of Medicine, St. Louis, 1925; specialist certified by the American Board of Pediatrics; fellow of the American Academy of Pediatrics; served as secretary and president of the Ohio County Medical Society; pediatric consultant to Reynolds Memorial Hospital in Glen Dale; senior member of the pediatric staffs at Ohio Valley General and Wheeling hospitals; died Oct. 22, aged 54, of coronary occlusion.

Capps, Joseph Marshall, Kenton, Tenn.; University of Nashville Medical Department, 1895; Vanderbilt University School of Medicine, Nashville, 1895; died in the Obion County Hospital, Union City, Sept. 9, aged 87, of virus pneumonia and chronic myocarditis.

Cogen, Murray ⊕ Lawrence, N. Y.; L.R.C.P., Edinburgh, L.R.C.S., Edinburgh, and R.F.P.S., Glasgow, 1940; member of the American Trudeau Society and the American Academy of General Practice; served during World War II; on the staff of St. Joseph's Hospital in Far Rockaway; died Sept. 20, aged 43, of coronary thrombosis.

Coutts, Gordon Shelswell ⊕ Cape Vincent, N. Y.; University of Toronto Faculty of Medicine, Toronto, Canada, 1925; health officer for the town of Cape Vincent and school physician at Cape Vincent Central School; died Aug. 12, aged 54, of ventricular fibrillation and rheumatic myocarditis.

Donelson, Kater ⊕ Inkster, Mich.; Wayne University College of Medicine, Detroit, 1944; interned at the City of Detroit Receiving Hospital in Detroit, where he was formerly a resident; served as a captain in the Medical Corps, Army of the United States; died in the Wayne County General Hospital, Eloise, Sept. 26, aged 45, of coronary thrombosis.

Drew, John Almus, Bradenton, Fla.; University of Vermont College of Medicine, Burlington, 1895; died in Tampa Sept. 30, aged 85, of cerebral hemorrhage.

Duckwall, Fred M. ⊕ Kingsport, Tenn.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1928; director of the Kingsport National Bank and president of the Medical Arts Building, Inc.; president and charter member of the medical staff of the Holston Valley Community Hospital, where he died Sept. 27, aged 54, of coronary thrombosis.

⊕ Indicates Member of the American Medical Association.

Farrell, Chalmers Gregg ⊕ Gardiner, Maine; Starling-Ohio Medical College, Columbus, 1911; died in Togus Sept. 30, aged 69, *of anoxemia.*

Friedman, Jack ⊕ Minneapolis; University of Illinois College of Medicine, Chicago, 1939; clinical assistant professor of radiology at the University of Minnesota Graduate School, Minneapolis-Rochester; specialist certified by the American Board of Radiology; member of the American Roentgen Ray Society, Radiological Society of North America, and the American College of Radiology; served during World War II; on the staff of the Mount Sinai Hospital, where he died Sept. 29, aged 44, of adenocarcinoma of the upper lip.

Garfield, Herman Joseph ⊕ Philadelphia; Temple University School of Medicine, Philadelphia, 1929; served with the communicable disease section of the city health department; on the staff of the Albert Einstein Medical Center-Northern Division, where he died recently, aged 51.

Hoff, Einar, Seattle; University of Illinois College of Medicine, Chicago, 1915; served during World War I; died in Tacoma Oct. 19, aged 73, of neoplasm of the prostate gland.

Holden, William Burroughs ⊕ Portland, Ore.; Rush Medical College, Chicago, 1897; professor emeritus of surgery at the University of Oregon Medical School; member of the founders group of the American Board of Surgery; past-president of the Portland Academy of Medicine and the Multnomah County Medical Society; member of the Western Surgical Association; fellow of the American College of Surgeons; on the staff of the Portland Sanitarium and Hospital; on the consultant staff of St. Joseph's Hospital in Vancouver, Wash.; died Nov. 1, aged 82.

Jack, John Barnes ⊕ Auburn, Neb.; Rush Medical College, Chicago, 1895; member of the Illinois State Medical Society; died Nov. 5, aged 83.

Keene, Ralph Kendall ⊕ Spokane, Wash.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1897; died Oct. 26, aged 87, of carcinoma of the prostate.

Koons, Robert Ottens, Shickshinny, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1900; an associate member of the American Medical Association; died Nov. 9, aged 80.

Landon, Herbert William ⊕ Monroe, Mich.; Detroit College of Medicine, 1898; died in the Mercy Hospital Sept. 27, aged 82, of acute coronary occlusion and pulmonary tuberculosis.

Lawson, Lawrence Wells, Logan, W. Va.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1922; died in Spencer Nov. 3, aged 61, of a heart attack.

Lehmann, Theodore Alexander, Long Island City, N. Y.; Columbia University College of Physicians and Surgeons, New York City, 1895; an associate member of the American Medical Association; served on the staff of St. Vincent's Hospital in New York City; died in a nursing home in College Point Oct. 23, aged 85, of coronary thrombosis.

MacGregor, Mary Elizabeth Childs ⊕ Chatham, N. J.; Cornell University Medical College, New York City, 1922; served as president of the board of trustees of the Chatham Library; on the staff of the New York Infirmary in New York City; for many years school physician for Chatham schools; died Oct. 22, aged 59, of uremia.

Magee, Hosea Frank ⊕ Jackson, Miss.; Tulane University of Louisiana School of Medicine, New Orleans, 1915; in 1918 became health officer of Jackson; served as medical examiner for the draft boards during World Wars I and II; for many years physician for Millsaps College and the Methodist Home; formerly superintendent of the old Charity Hospital; on the staffs of St. Dominic's Hospital and the Baptist Hospital, where he died Oct. 17, aged 71.

Merriam, Gordon ⊕ Fairview, Mont.; Cornell University Medical College, New York City, 1946; certified by the National Board of Medical Examiners; member of the American Academy of General Practice; served as a captain in the Medical Corps, U. S. Army; secretary of the staff, Memorial Hospital, Sidney; died Oct. 4, aged 32, of coronary disease.

Mulvey, William Aloysius ⊕ East Greenwich, R. I.; Georgetown University School of Medicine, Washington, D. C., 1910; member of the Massachusetts Medical Society; served overseas during World War I; on the staffs of the St. Joseph's, Rhode Island, Roger Williams General, and Charles V. Chapin hospitals in Providence; died in the Jane Brown Memorial Hospital in Providence Oct. 9, aged 70.

Norris, Edgar Hughes ⊕ Detroit; University of Minnesota Medical School, Minneapolis, 1919; served as professor of pathology and dean at Wayne University College of Medicine and executive director of medical sciences of the Medical Science Center; member of the American Association of Pathologists and Bacteriologists; fellow of the American College of Surgeons; died Oct. 6, aged 61.

Palmer, Paul Whitney ⊕ Columbus, Ohio; Ohio State University College of Medicine, Columbus, 1921; on the staff of the Mount Carmel Hospital; chief and chairman of the surgical staff at Grant Hospital, where he was a senior member and where he died Oct. 31, aged 61, of cerebral hemorrhage.

Rochman, Robert, University City, Mo.; Washington University School of Medicine, St. Louis, 1950; died in the Barnes Hospital, St. Louis, Sept. 20, aged 33, of lymphosarcoma.

Royse, James G., Fort Worth, Texas; Medical College of Indiana, Indianapolis, 1900; at one time associated with the Indiana State Board of Health; died Aug. 15, aged 83.

Shuler, Ashley Cooper ⊕ Carlsbad, N. Mex.; University of Tennessee College of Medicine, Memphis, 1925; died Oct. 7, aged 57, of coronary infarction.

Stockler, Jules, Philadelphia; Temple University School of Medicine, Philadelphia, 1950; interned at the Cedars of Lebanon Hospital in Los Angeles; served a residency at the Veterans Administration Hospital in Long Beach, Calif., and the Philadelphia Psychiatric Hospital; certified by the National Board of Medical Examiners; died in Claremore, Okla., Sept. 18, aged 28.

Taylor, Frederick Raymond ⊕ High Point, N. C.; University of Pennsylvania School of Medicine, Philadelphia, 1913; specialist certified by the American Board of Internal Medicine; professor of medical literature and associate professor of clinical internal medicine at the Bowman Gray School of Medicine of Wake Forest College, Winston-Salem; served during World War I; fellow of the American College of Physicians; on the honorary staff, High Point Memorial Hospital, where he died Nov. 1, aged 68, of cardiac decompensation and arteriosclerotic heart disease.

Theobalds, John Anthony ⊕ New York City; Université de Lyon Faculté de Médecine et de Pharmacie, France, 1932; on the staff of the Mount Morris Park Hospital; died in Tunkhannock, Pa., Sept. 14, aged 55, of carcinoma.

Uloth, Milton J. ⊕ Ortonville, Mich.; Michigan College of Medicine and Surgery, Detroit, 1902; member of the American Academy of General Practice; on the staff of the Goodrich (Mich.) General Hospital, where he died Nov. 2, aged 79.

Wadsworth, Harvey Bryan, New Bern, N. C.; Johns Hopkins University School of Medicine, Baltimore, 1918; member of the Medical Society of the State of North Carolina; chief of staff at St. Luke's Hospital, where he died Sept. 1, aged 68, of myocardial infarction and coronary thrombosis.

Warner, Earl Albert, Blue Springs, Neb.; Keokuk (Iowa) Medical College, College of Physicians and Surgeons, 1905; on the staff of the Mennonite Deaconess Home and Hospital in Beatrice; died Oct. 11, aged 79, of coronary occlusion.

Wilson, Wirt B., Charleston, W. Va.; Maryland Medical College, Baltimore, 1911; an associate member of the American Medical Association; fellow of the American College of Surgeons; on the staffs of the Charleston General, St. Francis, Kanawha Valley, and McMillan hospitals; died Nov. 4, aged 74, of a cerebral hemorrhage.

Zipser, Max Armand, New York City; Bellevue Hospital Medical College, New York City, 1891; an associate member of the American Medical Association; died in St. Luke's Hospital Oct. 23, aged 86.

FOREIGN LETTERS

CANADA

Health Insurance.—In the last few months there has been much agitation for an extension of prepaid medical care plans, with payment of premiums for indigent persons by the provincial governments. In Ottawa on Oct. 4 the 10 premiers of the provinces met with the Prime Minister to discuss interprovincial problems. The Premier of Ontario presented a five-point plan that was based on an assumption that the federal government would have 60% financial participation and included a scheme for diagnostic services, home care, meeting of extraordinary hospital costs, hospital maternity care, and full hospital insurance to be implemented by stages. The provincial government and the municipality would pay premiums for indigent persons, and payroll deductions would take care of employees. The self-employed would be brought in later. Such a plan would cost about 169 million dollars in Ontario in 1957. A federal estimate for health insurance services has been given as $38 per capita, but Ontario officials estimate that in 1957 the cost of health care in their province (exclusive of mental health and tuberculosis services) will be $44 per capita.

There is a wide difference of opinion in the provinces about health insurance. At one end of the scale is the province of Quebec, which wants nothing to do with federal aid, and at the other end are provinces like Saskatechewan with going schemes, for which federal aid would be welcome. After much discussion the subject of health insurance was referred for future study to an intergovernmental committee of ministers from the provinces and the federal government, which will meet in December or January. The Prime Minister has meanwhile given an assurance that the federal government is prepared to support provincially administered health insurance schemes involving no constitutional change or interference in provincial affairs, provided a majority of the provinces representing a majority of the people are prepared to proceed.

Psychiatric Night-Treatment Center.—In anticipation of the facilities that would be available at the new Montreal General Hospital this year, a psychiatric night-treatment center was opened in the old building in 1954. The idea was to offer outpatient treatment to persons in need of psychiatric help. The facilities are comparable to those in the previously established day-treatment center, but the emphasis is on preventive psychiatry, to deal with psychoneuroses, psychosomatic disorders, and early psychoses before they have affected the patient's earning power. Patients report from Monday through Friday at 6 p. m. and leave the hospital each morning in time for work, spending the weekends in their homes. The same beds are used for three sets of patients, since they are occupied in the morning by day-center patients receiving subcoma insulin and in the afternoon by day patients or outpatients given electroconvulsive therapy. Night-center patients requiring electroconvulsive therapy are given it on Friday nights; subcoma insulin, group and individual psychotherapy, and recreational and occupational therapy are also freely employed. Subcoma insulin therapy in particular has proved of value. The staff is well satisfied with results so far. This center makes treatment possible for patients unable to afford full hospitalization or unwilling to disclose to friends and relatives their need for institutional therapy.

Poliomyelitis.—The first phase of the poliomyelitis vaccination program has been completed and is being evaluated. Somewhat under one million children, 5 through 8 years of age, have been inoculated, mostly by two injections of vaccine. Supplies of vaccine were prorated among the 10 provincial health departments and were administered in accordance with their own plans, generally to protect children in the age group with the greatest risk. Provincial programs began in April and stopped around the end of June. The incidence of poliomyelitis was relatively low this summer. Up to Oct. 8, 800 cases, of which 390 were described as paralytic, had been reported. This is only 25% of the yearly average for 1950 to 1955. The indications so far are generally favorable to the vaccine, but, because of the small numbers involved and the incomplete tabulation so far, no definite conclusion can be drawn as yet.

Montreal General Hospital.—The Montreal General Hospital was opened in 1821. Last May the old building in downtown Montreal closed its doors after transferring its remaining patients up the mountainside to a beautiful new building, which must be ranked as one of the show places of Canadian medicine. The 750-bed, 19-story hospital was officially opened on Oct. 4 by Her Royal Highness the Princess Royal, aunt to Queen Elizabeth II. The October issue of *Canadian Hospital* is entirely devoted to the hospital and its various features, and the Nov. 15 issue of the *Canadian Medical Association Journal* is also a special number, with all original articles contributed by past and present members of the hospital staff.

ENGLAND

General Practitioner Hospitals. — The annual report of the Northern Ireland Hospitals Authority for 1954 contains a copy of the report of a special committee set up to advise as to what action, if any, should be taken by the authority to increase the number of hospitals in which general practitioners may treat their patients. The committee sent a questionnaire on this subject to general practitioners, of whom there are 739 in Northern Ireland. Most of them were not in favor of additional general practitioner hospitals or of the suggestion that the authority should arrange for them to treat their patients in existing general hospitals. Of those practitioners who were willing to undertake part-time hospital duties, practically all preferred to have salaried appointments. There are now in Northern Ireland 17 general practitioners who hold regular salaried appointments in hospitals. There are also six small cottage hospitals and two small cottage maternity units in which most of the work is done by general practitioners. About 45 practitioners do such work. In eight general hospitals general practitioners deliver babies of their own patients, and in the teaching hospitals in Belfast there are a few short-term honorary appointments for general practitioners. The committee recommends that the authority should do everything in its power to provide for close cooperation between the hospital services and general medical practitioners. Many of the general practitioners are so busy that they would be able to do little, if any, hospital work. In planning for the future, however, the possibility of providing for more part-time assistantships in general practice, coupled with part-time hospital appointments, and for more opportunities for general practitioners to undertake hospital duties should be considered. The young graduate should not with finality have to make up his mind early in his career as to whether he intends to seek a career in the hospital service or in general practice. It would be advantageous if many young graduates continued to work in a hospital and sought higher qualifications in appropriate specialties with the intention of combining general practice and hospital work. Such arrangements would facilitate transfers from general practice to hospital work later. If a general practitioner has the necessary training and qualifications, there are many branches of hospital work in which he could participate on equal terms with those who devote full time to that work. Furthermore, there are many general practitioners who have not the inclination or the time to practice a specialty in a hospital but who could treat their patients hospitalized for minor illnesses.

Pregnancy in Diabetic Patients.—Disappointing results from the use of hormones in the management of pregnancy in diabetic patients are recorded in a report to the Medical Research Council

---

The items in these letters are contributed by regular correspondents in the various foreign countries.

by their conference on diabetes and pregnancy (*Lancet* **2**:833, 1955). The aim of the controlled clinical trial reported was to assess the results of a dosage schedule based on orally given preparations of ethisterone, which, in combination with diethylstilbestrol, might be expected to have physiological effects similar in nature and intensity to those of the parenterally given doses of diethylstilbestrol and progesterone used by Priscilla White in 1949. The criteria for inclusion in the trial, in addition to the presence of diabetes mellitus, was that the patient not be more than 40 years of age at her last menstrual period and that the pregnancy not be more advanced than 16 weeks at the time of inclusion in the trial. Patients were not accepted for trial if gross retinal changes, persistent elevation of the diastolic pressure above 90 mm. Hg, or other general disease that would necessitate special management of the pregnancy was present. Comparable groups of patients were stratified by age and parity and randomly divided into hormone-treated (76) and nonhormone-treated (71) groups. The former received diethylstilbestrol and ethisterone orally, and the control group was given inert but otherwise identical tablets. Differences in the number of conceptions in which children were produced who survived one month after delivery, the stillbirth rate, the neonatal death rate, the abortion rate, the survival rate among viable fetuses, the mean duration of pregnancy at the time of delivery, the mean birth weights of the infants, the quality of diabetic control during pregnancy, and the distribution of complications in the two groups were all negligible. Assays designed to measure the urinary output of pregnanediol and chorionic gonadotropin were carried out in a number of patients. The results suggested that either one or the other, or both, of the preparations given orally were absorbed, but that this had no effect on the pattern of hormonal excretion associated with fetal loss. The observers concluded that diethylstilbestrol and ethisterone given by mouth in the doses used did not reduce fetal mortality in diabetic patients and had little, if any, beneficial effect on maternal health in pregnancy.

National Accident Service.—In the annual special number of the *Practitioner* (October, 1955, page 450) devoted to advances in treatment, Mr. William Gissane makes an appeal for a national accident service. His article and appeal are based on the 14 years' experience of the Birmingham Accident Hospital in the treatment of 531,000 civilian injuries of all types. Advances in the treatment of accidents depend on the institution of a completely new tempo and quality of hospital treatment services. Experienced surgeons must always be immediately available, and the same speed and quality of service also must be always available from nurses, laboratory staff (in emergency cases mainly for safe blood transfusion), radiological service, and the operating room staff. As evidence in favor of his plan, he quotes American experience in the Korean war, with fully equipped hospitals within 30 minutes' helicopter flight of the front line and the wounded under full surgical care within an hour of their wounding. In Gissane's opinion, 25 fully equipped and staffed central accident services, strategically sited throughout the country, would assure the efficient early treatment of all severely injured in this country. These should be developed in or near general and, if possible, teaching hospitals. He quotes the experience of the Birmingham Accident Hospital as demonstrating how such accident centers dealing with large numbers of injured result in a financial saving. The average cost per accident treated by the Birmingham Accident Hospital is about $14, but the average total cost of each of these accidents to the community is about $280. Thus, 5% of the total cost is for treatment. If this were 10% and the services of the hospital improved, as they should be, improvements in results obtained would result in a saving of both money and production to the community.

Survival from Cancer.—Commenting on the Registrar General's Statistical Review for 1950 and 1951, the *British Medical Journal* of Sept. 17 says in an annotation that the analysis of the cases registered in 1945 and 1946 can be regarded as an early chapter in the more complete natural history of cancer, which is being built up from the cancer registration scheme. In this volume four sites are selected for special study—the female breast, the cervix uteri, the rectum, and the skin. Age distribution and survival rates are recorded. The corrected five year survival rates for patients with primary cancers without metastases, who were treated radically, were for cancer of the breast (67%), the cervix uteri (51%), the rectum (50%), and for epithelioma of the skin (over 80%). In each age group the survival rate of patients with cancer of the breast bears no relation to the interval before treatment. Especially among the late primary cases patients appear to have a better chance if they are treated either before three months have elapsed from the appearance of the first symptom or if the growth has existed for more than a year. The survival rate for patients with early primary carcinoma of the breast who have no secondary nodes or metastases is much higher in those between 45 and 49 years of age than in any other age group. The chances of survival in patients with cancer of the cervix uteri also appear to improve with the duration of the disease in certain age groups, irrespective of whether the disease is first seen in an early or later stage. Again, in so far as cancer of the rectum is concerned, the only conclusion that can be drawn is that the chances of survival are not directly related to the time elapsing between the onset of the first symptom and the commencement of treatment.

Salmonella Organisms in Meat.—From 1950 to 1953 various materials sampled from carcasses of cattle, calves, and pigs at the time of slaughter were cultured for Salmonella organisms in abattoirs in six centers throughout the country. The subcommittee on Salmonella of the public health laboratory reports (*Month. Bull. Min. Health* **14**:132, 1955) that in cattle Salmonella dublin was the commonest type isolated, comprising 42 of 45 strains. Three strains of Salmonella typhimurium were also isolated. The isolations were from a few specimens of bile, liver, spleen, mesenteric glands, and feces, but negative results were obtained from swabbing the peritoneal surfaces of 1,518 sides of beef. No salmonella organisms were isolated from the liver or spleen of 494 calves. In pigs, S. dublin was isolated in one center from 6 of 452 samples of bile and from the liver, spleen, and glands of one of 27 pigs. This organism was not isolated by the other laboratories, which obtained negative results from 500 samples of bile, 1,130 of liver, 687 of spleen, and 677 of feces. Two strains of S. typhimurium were isolated from 1,146 peritoneal swabs, and one strain of S. typhimurium was isolated from 409 samples of mesenteric glands.

Death After Ten Months Not Murder.—That the death of a 59-year-old man more than 10 months after he was stabbed by his son during a quarrel was not murder was decided at the Old Bailey. Seven physicians testified in the case. The prosecutor said that under the law if a man stabbed another with intent to cause grievous bodily harm and that if the other man died of that injury within a year and a day it was murder. The prosecution had to prove that the father's death resulted from one of the stab wounds. At the time of the stabbing none of the wounds was regarded as serious, and the injured man made a good recovery. In June he complained of abdominal pains, was operated on, but died on the next day. One physician testified that the stab wound was superficial and had not entered the chest or abdomen. Another physician said that a roentgenogram showed that the deceased had a strangulated diaphragmatic hernia. A pathologist testified that it was highly probable that the stab wound caused the hole in the diaphragm, but since this could not be proved beyond reasonable doubt, the defendant was acquitted.

Wellcome Trust.—On Oct. 5 Sir Henry Dale, chairman of the Wellcome Trust, announced new developments in the work of the trust, which came into existence in 1936. The trust is the holder of the entire share capital of the Wellcome Foundation and is responsible for seeing that the income is used according to the instructions contained in the founder's will. To date the trust has had a more or less *ad hoc* existence. For its first five years all its resources were absorbed in paying the heavy death duties on Sir Henry Wellcome's estate. Then came World War II, followed by the unsettled postwar conditions that have persisted until recently. The trustees have now decided that the trust can embark on a coordinated long-term policy. They have therefore moved to larger offices on Harley Street, have enlarged their administrative staff, and have appointed Dr. F. H. K. Green, formerly principal medical officer on the headquarters' staff of the Medical Research Council, as scientific secretary to the trust. He will be responsible for the executive organization of the trust's spending policy.

Isotope Brain Test Rejected.—After enthusiastic American advocacy at a London conference on the use of radioactive arsenic and other isotopes in locating brain tumors, the method was denounced by Mr. Wylie McKissock at the fourth neuroradiological symposium in London. The method involves injecting a radioactive isotope into a vein. Since a tumor is more vascular than the rest of the brain, it absorbs more of the material. When a Geiger counter is placed on the scalp "it ticks like mad" over the tumor. British specialists used the method for several years. Mr. McKissock found that it gave accurate results in only 60% and false results in about 10% of cases. Sometimes it indicates that a tumor is present when there is none, and sometimes it misses one that is there. For practical purposes an accuracy rate of 60% is of no value, especially since other methods give an accuracy rate of about 95%. The present value of the new method lies in research.

National Health Service Progress.—Although, according to the report of the Ministry of Health for 1954, the number of people on hospital waiting lists in England and Wales fell by about 50,000 last year, at the end of the year, 474,000 still awaited admission. This was, nevertheless, the most substantial reduction for any one year since the National Health Service began. The reduction by 43% in patients awaiting admission to tuberculosis units and sanatoriums was especially encouraging. The cost of the health service was about 36 million dollars less than that for 1953. Hospital and specialist services accounted for 55.5% of the cost; general practitioners for 11%; drugs for 9.7%; local health departments for 9%; dental service for 6%; and ophthalmic service for 2.2%. Patients met 5% of the cost. The average length of stay in the hospital was shortened. Nearly 60,000 more persons attended outpatient departments than in 1953.

Spirochetal Jaundice.—The exceptionally long dry spell this summer is suggested as a possible cause of the unusually high incidence of spirochetal jaundice that has been reported. In August 31 cases were reported, whereas the total number reported in 1953 was 98 and in 1954 106. Of the 31 cases reported in August, 21 were due to Leptospira icterohaemorrhagiae of which 3 were fatal; 8 were due to Leptospira canicola; and in 2 the species was unknown. In most cases the source of infection was not found, but, of those due to Lept. icterohaemorrhagiae, the proportion with a history of occupational risk was unusually low. Six had recently bathed in rivers. The hot dry weather may have contributed to this increase in leptospiral infections by encouraging river bathing and by increasing river pollution.

Singer Aids Health Drive.—Through the enterprise of a civil servant in St. Andrew's House in Edinburgh, Miss Nellie Lutcher is helping to swell the crowds flocking to have their chests x-rayed in the present mass drive. This civil servant learned that Miss Lutcher was singing a song to help a similar campaign in the United States. He procured seven records of the song, and now health officers ask dance halls in the towns where mass miniature radiography units are operating to play the record during intermissions. It is believed that the 6,000 persons a week who are being x-rayed include a large number of teen-age boys and girls influenced by the song.

Nurses Want Free Prescriptions.—Miners get free coal and railwaymen free travel, why should not nurses get free medicine prescriptions? This was the argument put forward by Mr. R. Miller, a male nurse, at the annual conference of the Society of Registered Male Nurses in Edinburgh. The delegates agreed to negotiate with the Whitley Council to exempt all nurses from the shilling fee for prescriptions dispensed within the hospital.

Equal Pay for Women.—Women in the National Health Service are to be paid at the same rate as men. Their scales will be raised by annual increments until equality is reached on Jan. 1, 1961. More than 60,000 full-time nurses employed in hospitals and by local health departments in England and Wales will benefit. Others to benefit include midwives, professional and technical staff, and administrative and clerical workers.

NEW ZEALAND

Accidents in the Home.—According to the medical statistics branch of the health department more accidents occur in homes than on the highways. In 1952, the latest year for which full statistics are available, 108 persons were hospitalized for accidents in the home for every 100 hospitalized for transport accidents. These figures take no account of those treated as outpatients. About 75% of all accidents in the home are treated in outpatient departments. Falls are the most common accidents occurring in the home. In 1952, falls in the home resulted in 96, or 44%, of the 222 deaths from accidents in the home. The principal hazards are polished floors, loose mats, loose edges of carpets, objects left lying on the floor, wet or frosty paths, stairs, and furniture. The number of accidents to children due to falls from trees, fences, and embankments reflect the venturesome nature of the growing boy. More than half of the falls from roofs involved children. Burns and scalds were very common among children under 2 years of age.

Deaths Due to Tuberculosis.—The Annual Report of the Director General of Health shows a steady decline in deaths from pulmonary tuberculosis in the white population. The same cannot be said of the Maoris, however, their rate showing a steady increase over the years. These figures probably represent the greater number of Maoris reporting for treatment through a breaking down of previous inhibitions in this respect. The Maoris do, however, show a steady decline in deaths from nonrespiratory tuberculosis. In nurses, there has been a decline in incidence of nearly 80% in the past five years.

BCG Vaccination.—The number of BCG vaccinations increased in 1954, with better coverage of hospital staff, contacts of registered patients, adolescents, and young adults. In New Zealand, where comparatively few are now infected before adulthood, vaccination of adolescents can be of real value in preventing tuberculosis.

NORWAY

Use and Abuse of Medical Certificates.—One of the postwar acts of the Norwegian Medical Association was to appoint a committee to deal with the various aspects of medical certificates. In an address delivered at a course for general practitioners, a member of this committee, Prof. Axel Ström, said that one of its duties has been to draft more or less standardized medical certificates. It has also tried to defend the medical profession against unreasonable demands made by the public and various official bodies. It is authorized to prevent physicians from using unsuitable certificates. Another function of the committee is to examine complaints and disputes over medical certificates and, if need be, report on them to the central committee of the Norwegian Medical Association. When articles of food have been rationed, physicians have often been put in an awkward position if required to certify that a certain person is entitled to preferential treatment. Their task would be easier were the rationing authorities to specify exactly which ailments qualify a patient for an extra supply of rationed food and were physicians instructed by the committee to refuse to issue any milk certificates until the authorities had defined the ailments qualifying for them. Another form of certificate expected of physicians concerns candidates for admission to schools and other bodies. Some of these admission certificates have been so poorly drafted by school authorities that they defeat their purpose. The committee has now drafted two model certificates, one elaborate and one comparatively short, for the use of school and other authorities. Some employers have objected to the wording of the committee's medical certificates concerned with the dates of the illness of employees. This difficulty has not yet been fully overcome, and the committee continues to be troubled over the drafting of life insurance certificates and the problems of privileged communications. The committee has discouraged the application by the public for the drafting of certificates that can serve no useful purpose.

Treatment for Drowning.—Dr. Sten Florelius, secretary-general of the Norwegian Red Cross, endorses the instructions given to ambulance workers—to start artificial respiration at once and to continue it until the patient has recovered or a physician has come and can take on all further responsibility. He quotes the case of a child who had been under water for three or four minutes and who showed no signs of life until artificial respiration had been continued for an hour. Ten minutes later the child was breathing normally. In another instance three boys had been under water or struggling on ice for 10 to 12 minutes before artificial respiration could be started. It was continued for 25 to 30 minutes before there were any signs of life, but it took two and a half more hours of treatment for normal respiration to be restored. Persons buried in snowdrifts may require several hours of treatment before normal breathing is restored.

SWITZERLAND

Adrenal Cortex and Diabetes Mellitus.—Professor Bastenie of Brussels, Belgium, reported before the Medical Society of Geneva that experimental adrenal diabetes is characterized by negative nitrogen balance, resistance to insulin, and absence of acidosis and is of a transitory nature. The disturbances disappear after injection of steroid hormones. Clinically, the diabetes is that of Cushing's syndrome. Although many authors have said that steroid diabetes is a rarity, Bastenie thinks that the adrenal glands play an important part in all cases of diabetes mellitus and that the cortical hyperfunction and consequent disturbances of glycometabolism caused by the disease are not peculiar to Cushing's syndrome. Since it is usually difficult to discover minor disturbances in glucose metabolism, Bastenie used his own method of rapid intravenous injection of dextrose, during and after which variations in blood sugar are recorded. After a marked transitory elevation, another elevation is observed between the 15th and 60th minute. An exponential curve can be plotted for this second phase, and, from this, one can determine a glucose assimilation factor that is independent of the quantity of dextrose injected or the state of dehydration of the patient. The descent of the exponential curve and its coefficient increases when the patient is given insulin; the opposite happens when the patient is given cortisone, but if this treatment is continued, the coefficient comes back to the normal value or even surpasses it, proving that cortisone favors the assimilation of glucose. In a diabetic patient cortisone increases glycemia, diminishes sensitivity to insulin, and causes insulin resistance. It does not increase preexisting insulin resistance.

Professor Bastenie studied the Achard-Thiers syndrome, which is the clinical manifestation of an adrenocortical hyperfunction between Cushing's syndrome and the adrenogenital syndrome. This condition is seen after the menopause in women who are, or who were, obese. It takes the form of a benign diabetes (rarely acidosic except with severe infection or injections of corticotropin) and hypertension. The patients show an elevation of 17-ketosteroid secretion, which is of adrenal origin. Under the influence of corticotropin an aggravation of the diabetes, which then resembles ordinary severe diabetes, occurs. Cortisone also diminishes the tolerance of these patients to glucose, but the disease sometimes undergoes spontaneous improvement. Pregnant women also have increased glucose assimilation: their coefficient is elevated above that of normal subjects. The adrenocortical hyperfunction of pregnancy can increase insulin secretion or aggravate latent diabetes, causing it to show clinical manifestations. Professor Bastenie thinks that steroid diabetes does not always have the four characteristics mentioned above. Hypercorticalism manifests itself also in diabetic patients with coma and acidosis. There, one sees eosinophilia develop in inverse proportion to the severity of the condition. Thus, the eosinophilia increases when glycemia falls. Insulin hypoglycemia aggravates the diabetes by stimulating the adrenal cortex. In view of this, therapy for decompensated diabetes ought to include reduction of adrenocortical function.

Atypical Onset of Acute Leukemia.—In all countries statistics reveal an increasing incidence of leukemia. In Switzerland, the rate has more than doubled in the last 10 years. The statistics depend not only on the growing number of cases but also on more frequent discovery of atypical cases. The onset of the disease may be localized to a single segment of the bone marrow and discovered by biopsy. H. Dubois-Ferrière and H. Goldschlag (*Schweiz. med. Wchnschr.* **85**:946, 1955) saw several patients with acute leukemia whose cases were originally diagnosed as refractory anemia with neutrophilic leukopenia and thrombocytopenia, often in the absence of splenomegaly. These cases could not have been diagnosed without the help of repeated puncture of the sternum, vertebral spiny apophyses, and crest of the ilium. One of the authors' patients was a 59-year-old man who complained of fatigue and increasing pallor of one year's duration. He was thin and dyspneic when the first hemogram was made, and it revealed hyperchromic anemia, with an erythrocyte count of 1,900,000 per cubic millimeter, 55% hemoglobin, and a leukocyte count of 3,600 per cubic millimeter, with normal distribution. He was treated for four weeks with 1 mg. of vitamin B_{12} in biweekly injections, but the anemia did not regress and the erythrocyte count fell to 1,600,000 per cubic millimeter, with a colorimetric index of 1.13. The leukocyte count was 1,130 per cubic millimeter and the presence of megaloblasts was reported. Treatment was increased to 1 mg. of vitamin B_{12} every day, and liver extract and folic acid were also given. After six weeks the hemogram remained unchanged. Splenomegaly had been noted, but this was forgotten in the face of the hematological picture that so strongly suggested pernicious anemia. The failure of therapy led to hospitalization of this patient. There, sternal puncture showed 65% atypical megaloblasts. There were only 2 to 7% atypical myeloblasts in the blood. Another interesting case occurred in a 6-month-old child who was febrile and anemic. Clinical examination suggested infectious anemia. The leukocyte count was 7,500 per cubic millimeter, and no atypical forms were seen. Sternal puncture showed a normal bone marrow, but spinovertebral puncture performed two days later showed the marrow to be wholly leukoblastic. Thus, acute leukemia developed in the form of anemia resistant to therapy, with granulocytic leukopenia in these two patients. The second case showed that the onset of the disease may be localized to a particular region of the skeletal system and that multiple biopsy is indispensable if the data suggest malignant hemopathy, even without myeloblastosis.

Psychiatric Nurse.—According to the Expert Committee on Psychiatric Nursing of the World Health Organization, the psychiatric nurse should be a guardian angel and not a guard. She not only should contribute to the care and cure of the mentally ill but also should help them regain a place in normal life and help to prevent recurrence of the mental illness. Her training should make it possible for her to carry out these functions side by side with the psychiatrist. It is estimated that in Europe and North America between 40 and 50% of all hospital beds are occupied by mental patients. Their care therefore presents a problem that concerns society in general, and one crucial aspect of this problem is nursing care. The importance of the role of the psychiatric nurse should be recognized. Her training should include comprehension of personality growth and development, theories of human behavior, concepts of anxiety, the sociologic aspects of psychiatric assistance, and group methods applicable to situations within ordinary community life. She should also be encouraged to participate more actively in research in the prevention and treatment of mental illness. This would not only give her a better understanding of her own role but the results of her observations would also be a valuable tool for the psychiatrist in his understanding of patient-nurse relations and of the effect of the nurse on her patient.

Chemical Products in Foodstuffs.—Many chemical products are used to season, color, or preserve foods. In the United States, for example, more than 800 such products may be added; in Sweden, 500; and in Germany, over 1,000. The World Health Organization is investigating this matter, since many countries are worried about this "chemical invasion" and have passed various laws to control it. The Alimentation and Agriculture Organization and the World Health Organization held a conference in Geneva and concluded that international action should be taken for the following reasons: the situation is fraught with a latent danger to health, which danger threatens all nations, and no single nation or laboratory by itself could establish international coordination. The most urgent task consists in establishing uniform methods of evaluating the toxic effects of the chemical products used and in formulating principles for their use. The problem of coloring agents is especially important because substances synthesized from coal tar are now being used.

MEDICAL LITERATURE ABSTRACTS

INTERNAL MEDICINE

Benign Essential Hypertension: Follow-Up of 100 Patients Under Observation for from 18 to 34 Years. A. M. Burgess. Ann. Int. Med. 43:740-744 (Oct.) 1955 [Lancaster, Pa.].

One hundred persons with essential hypertension were observed during the years 1923 to 1954. All had shown a systolic pressure of 180 mm. Hg or higher, or a diastolic pressure of 100 mm. Hg or higher, and had remained in good health for eight years before being included in the series. By July 1, 1954, 74 had died, 18 were alive and well, and 8 could not be traced. When the last report of those who could not be traced was counted as the end of their lives, the average length of survival was to within 2.7 years of life expectancy, as shown in life insurance tables. Thirty-two patients were 50 years of age or younger when first observed to have hypertension. The youngest was 28 years. Of this group 17 had died, 13 were alive, and 2 could not be traced. The average individual had, at the time of this report, lived to within 7.6 years of his life expectancy. Sixty-eight patients were over 50 years of age when first found to be hypertensive. Of this group 55 had died, 7 were alive, and 6 could not be traced. The average individual of the group had lived 1.2 years beyond his life expectancy. None of the patients had symptoms directly attributable to hypertension. Some dizziness and occasional headaches were mentioned by the older group, in about the same proportion as occurs in others of the same age. Systolic pressure of over 300 mm. Hg, as was seen in five patients, did not appear to cause any symptoms. Although the series is too small to allow definite conclusions or to be of statistical value, the author gained the impression that essential hypertension of long duration is a nonprogressive, benign condition that, in the absence of cardiac, retinal, or renal damage, is compatible with a duration of life up to normal expectancy in individuals over 50 and in many who are under that age. Because of the anxiety of most patients about high blood pressure, their attention should not be directed to it. Unless or until the patient shows signs of beginning cardiac, retinal, or renal damage, surgery is not indicated, and the temptation to use the modern hypotensive drugs should be resisted. Early malignant hypertension may be indistinguishable at first from the benign condition, and frequent observation is advisable until the diagnosis is clear.

Controlled Hypotension with 4560 RP and Procainamide: Observations on Forty Cases. F. Matturro. Gior. ital. chir. 11:956-963 (Aug.) 1955 (In Italian) [Naples, Italy].

The administration of Largactil (4560 RP) combined with that of procainamide was used by the author to induce hypotension. At first, the procainamide was given intravenously in a 2:1,000 concentration at the rate of 30 to 40 drops per minute after one vial (0.05 gm.) of Largactil had been emptied into the infusion tube. A constant and evident hypotensive effect became manifest in an average of 15 to 20 minutes. Later, a more marked and more constant hypotensive effect was obtained by administering the procainamide in a 3:1,000 or 4:1,000 (1.5 or 2 gm. in 500 cc. of isotonic sodium chloride solution) concentration at the rate of 80 to 100 drops per minute. The author used this combination for 40 surgical patients who were given one vial of Largactil and from 0.4 to 1.5 gm. of procainamide, the smallest doses of the latter being given, with prompt and marked effects, to patients with hypertension and arteriosclerosis. The pulse and the respiration remained satisfactory, and alarming signs were not observed during or after the operation. The immediate postoperative course was good, secondary hemorrhages were not observed, and there was a gradual (an average of 8 to 10 hours) return of the arterial pressure to the preoperative values. The pharmacological action of this combination can be summarized as follows: (1) on the ganglions, a marked ganglioplegic effect and blocking of conduction; (2) on the centers, synaptic interruption between the cortex and the diencephalon and depression of the vasomotor center and the central vasomotor mechanisms; and (3) on the periphery, abolition of vasoconstriction and of the vascular tone. Because of these actions, the vasopressor reflexes that are due to stimulation of the vasosensitive zones and in particular of the carotid sinus area can no longer take place. With this combination, those side-effects that are usually seen in patients in whom hypotension is induced by means of methonium salts are prevented and, because of a more complete blocking of the autonomic nervous system, tachycardia is also prevented. The main value of the Largactil-procainamide combination lies in the synergism and potentiation of the effects of the two drugs.

Threatening Myocardial Infarction. H. Kjærgaard. Ugesk. læger 117:1177-1180 (Sept. 8) 1955 (In Danish) [Copenhagen, Denmark].

In threatening myocardial infarction, unprovoked attack of prolonged precordial pain, pain not relieved by rest or glyceryl trinitrate (nitroglycerine), and absence of objective signs of myocardial infarct are characteristic. Occasionally an acute myocardial infarction occurs after an interval of hours or days. The condition is ascribed to some acute narrowing of a coronary artery. Threatened myocardial infarction is suggested by symptoms of long-continued precordial pain, angina pectoris at rest, sudden occurrence of angina pectoris in patients previously well, sudden aggravation of angina pectoris, sudden ineffectivity of glyceryl trinitrate in angina pectoris, and nocturnal dyspnea. The treatment is immediate rest in bed, continued for from 7 to 12 days.

Functional Behavior of the Kidney in Mitral Disease. A. Amerio, A. Vercellone and G. Lunel. Minerva med. 46:211-217 (July 28) 1955 (In Italian) [Turin, Italy].

The authors studied the renal function in 33 patients with pure mitral stenosis and 17 with mitral stenosis associated with decompensation on all of whom surgery was performed by Prof. A. M. Dogliotti. On the basis of the severity of the subjective and objective symptoms, the patients were divided into four groups. Group 1 consisted of those patients who practically showed no clinical signs of heart decompensation; group 2, of those in whom this was evidenced by marked dyspnea on effort and at night; group 3, of those with signs of right ventricular decompensation, stasis cirrhosis, and malleolar edema on effort; and group 4, of those with frank decompensation and stabilized edema. It was found that the kidney circulation, as shown by the renal plasma flow and the filtration fraction, was already impaired in the early stages of the disease (group 1), whereas the glomerular activity was hardly altered at this time. The impaired circulation was the severest renal dysfunction in these patients, and it became severer as the heart disease progressed. It was the only alteration that was present without exception in all the group 4 patients. The tubular activity of the kidney in these patients was only slightly altered. Many workers agree on a cause and effect relationship between the general hemodynamic alteration and renal ischemia. An attempt at establishing the relationship between the ischemia and the degree of

The place of publication of the periodicals appears in brackets preceding each abstract.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individuals in continental United States or Canada who subscribe to its scientific periodicals. Requests for periodicals should be addressed "Library, American Medical Association." Periodical files cover 1946 to date only, and no photoduplication services are available. No charge is made to members, but the fee for others is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time, and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

stenosis, as evaluated during the operation, showed the existence of a relationship between the two hemodynamic factors. The hypothesis is advanced that the first cause of the hemodynamic alterations may be the barrier opposed by the stenosed mitral orifice to the blood that flows from the atrium into the left ventricle with a consequent and proportional reduction of the cardiac output and secondary ischemia of the kidney. The nature of the relationship between the two hemodynamic factors is not known.

Treatment of Bronchial Asthma with the Adrenocorticotropic Hormone (ACTH). B. B. Kogan. Klin. med. 33:49-57 (Aug.) 1955 (In Russian) [Moscow, U. S. S. R.].

Corticotropin is not a specific therapeutic agent for bronchial asthma, but its spasmolytic and antiallergic effects make it a valuable adjunct in the therapy of attacks of this disease and, especially, of status asthmaticus. Its antiallergic action is manifested in the uniform lowering of blood eosinophils. In the present series, 26 patients were treated with corticotropin. The short-term results were very good in 11, good in 5, fair in 3, poor in 3, and nil in 3. In one patient, administration of the hormone caused extrasystoles. In patients with pulmonary fibrosis and intractable emphysema with chronic pulmonary insufficiency but without true bronchial asthma or clinical signs of bronchospasm and eosinophilia, corticotropin therapy had no effect. In those patients benefited, good results were achieved within two to three weeks when daily doses of from 20 to 40 units of corticotropin were used. Side-effects pertaining to the sympathetic nervous system with this dosage were observed in only two patients. The advantage that corticotropin has over other spasmolytic agents such as epinephrine, ephedrine, and euphylline lies in its favorable effect on the state of the body as a whole. The hormone is the treatment of choice in bronchial asthma, provided certain contraindications are not present (pulmonary tuberculosis, hypertensive disease, arteriosclerosis, or ulcer).

The Low Salt Syndromes. T. S. Danowski, E. B. Fergus and F. M. Mateer. Ann. Int. Med. 43:643-657 (Oct.) 1955 [Lancaster, Pa.].

Sufficient evidence has accumulated to indicate the existence of several different types of "low salt syndrome." The authors suggest that the general classification "hyponatremia" might be used to refer to all abnormally low concentrations of sodium in plasma, irrespective of etiology, and perhaps replace the somewhat misleading designation, "low salt syndrome." Hyponatremia may be present with decreased, intact, or increased total stores of extracellular sodium. The authors discuss these different types of hyponatremia and review their clinical experiences in the light of these different entities. They list the clinical diagnoses and probable etiology of hyponatremia in 137 hospitalized patients. Depending on the age group, one-third to one-half of the patients in whom hyponatremia developed were ill with diseases that ultimately proved fatal. Hence, the appearance of low values of serum sodium may well be an ominous sign. The authors reviewed the clinical and laboratory findings in this group of patients and tried to ascertain the origin or origins of the hyponatremia. In this, they relied on the clinical history, the intake and output data, the results of external balance studies, and the responses to therapy. The history, symptoms, signs, and laboratory findings will often permit differentiation of hyponatremia resulting from sodium depletion or cellular hypo-osmolarity in which sodium stores are reduced, water intoxication and hyperlipemic hynonatremia in which body sodium is intact, and the hyponatremia encountered in edema states such as congestive heart failure, cirrhosis, and renal failure in which the total sodium of the body is actually increased. The commonest cause of hyponatremia in children was sodium depletion occurring in the course of diabetic acidosis, gastrointestinal fluid losses, and cerebral disorders. The diabetic children invariably survived, whereas the mortality was approximately one in three in the other groups; in adults, hyponatremia was encountered most often in patients with cardiac or renal failure. The mortality in these groups was approximately 50%. It should be recognized that analyses of serum solute values were in general requested in patients who were seriously ill. It may well be that other forms of unrecognized hyponatremia exist.

Diabetes, Hyperthyroidism, and Cardiopathy in Elderly Patients. L. M. Alvarez, R. E. Pupi and J. Raffaele. Rev. Asoc. méd. argent. 69:174-176 (June 15-30) 1955 (In Spanish) [Buenos Aires, Argentina].

Diabetes, hyperthyroidism without goiter, and cardiopathy are rarely associated in the elderly. Hyperthyroidism aggravates diabetes. It is masked by the symptoms of the complicating cardiopathy. The symptoms of hyperthyroidism in the elderly are more or less the same as those of diabetes in patients of the same age, with the exception of the increase in the basal metabolism in hyperthyroidism. A diagnosis is made by the coexistence of characteristic symptoms, with high values of the basal metabolism in repeated tests, and of positive results of the test of capturing radioactive iodine. The treatment aims to compensate diabetes and the cardiac insufficiency and to restore thyroidal hyperfunction to normalcy. Hyperthyroidism greatly increases the requirement of insulin in the elderly, in certain cases, to a true insulin resistance. Its reversal causes great improvement of diabetes and of the cardiac insufficiency. The treatment, after this improvement, can be continued with satisfactory results with smaller doses than those previously administered, or with small doses of insulin and discontinuation of digitalis. The authors observed two women, 60 and 62 years old, respectively, with diabetes, hyperthyroidism without goiter, and cardiopathy. The treatment of diabetes followed the classical schedule. Hyperthyroidism was controlled by the administration of methyl propylthiouracil alone or followed by the administration of radioactive iodine. The course of diabetes and the control of cardiac insufficiency were more favorable when euthyroidism was reached after administration of methyl propylthiouracil than after administration of radioactive iodine.

The Clinical Value of Renal Biopsy. R. M. Kark, R. C. Muehrcke, C. L. Pirani and V. E. Pollak. Ann. Int. Med. 43:807-847 (Oct.) 1955 [Lancaster, Pa.].

The inherent difficulty with renal biopsy is finding the organ with the biopsy needle. The authors use intravenous pyelograms and an atraumatic, fine exploring needle to locate the lower pole of the kidney before they insert the thin Franklin-Vim-Silverman biopsy needle to secure a small core of renal tissue. In the prone position, a sandbag placed under the abdomen pushes the kidney near the surface of the back and also insures hemostasis after the biopsy has been taken. The point of the exploring needle is in the kidney when that portion of it outside the skin swings through a wide arc with deep inspiration. Exact location of the kidney by this simple maneuver is the reason why this technique is more efficient in obtaining tissue than any other published method. The main contraindications to this type of biopsy that the authors have encountered have been progressive severe uremia, a hemorrhagic diathesis, lack of cooperation on the part of patients, severe calcific atherosclerosis, and surgical lesions of the organ such as hydronephrosis. The authors did 200 renal biopsies with patients in the prone position. No serious complications developed; morbidity was slight. Cultures of the blood and tissues taken from the kidney were made in all cases. Renal biopsy seems to be more accurate than cultures of the urine in determining the organism responsible for infection within the kidney. Five patients were observed in whom urine cultures were repeatedly negative and in whom culture of the kidney tissue was positive. They all responded to treatment with antibiotics. Analysis of the results demonstrates that renal biopsy is useful in the diagnosis and management of diseases involving the nephron, the vessels, and the ground substance of the kidney. In the nephrotic syndrome it is frequently difficult to make a prognosis when the patient is first seen, but renal biopsy facilitates prognosis in this condition. Serial biopsy studies have enabled the authors to make a close clinicopathological study of the natural history of renal diseases; the biopsies have been useful in determining the response of the organ to treatment and are proving valuable in solving problems related to renal pathophysiology, such as the origin and mechanism of renal hematuria and proteinuria.

Adrenocorticotropic Hormone and Adrenal Steroids in the Management of Infectious Diseases. W. W. Spink. Ann. Int. Med. 43:685-701 (Oct.) 1955 [Lancaster, Pa.].

While reduction of inflammation was mentioned as one of the most important effects of treatment with corticotropin and cortisone by Hench and his associates and subsequently by other investigators, it was also shown that these hormones could convert a mild infection into a fulminating and lethal disease. Spink is concerned with the desirability of the short-term use of corticotropin or corticosteroids in critically ill patients with certain infectious diseases. His discussion revolves around certain aspects of the problem that have been of interest to investigators at the University of Minnesota. Adrenocorticotropin and corticosteroids subdue inflammation and suppress the toxic reactions in patients having infectious diseases. For these reasons these hormones are of value in carefully selected patients who are critically ill or who have debilitating complications. Tuberculosis, acute rheumatic fever, typhoid, brucellosis, trichinosis, viral hepatitis, mumps orchitis, and infectious mononucleosis are among the diseases in which the clinical course has been favorably altered by treatment with the steroid hormones. Adrenal insufficiency may participate in the peripheral vascular collapse and in shock that occurs in bacteremic states, particularly in those caused by gram-negative bacteria. Adrenocorticosteroids may be used advantageously in such patients, along with antibiotics and pressor agents. Severe hypersensitivity reactions, involving the skin, vessels, joints, and bone marrow, which are induced by therapeutic agents, including the sulfonamides and antibiotics, can be promptly controlled by the administration of the corticosteroids. Corticotropin and corticosteroids have profound metabolic effects on the human organism, and, when used in the management of infectious diseases, these agents should be given for only brief periods and only to carefully selected patients.

C-Reactive Blood Protein in Inflammatory Disease: Its Value as an Index of Rheumatic Activity. P. A. Ruggieri. J. M. Soc. New Jersey 52:500-504 (Oct.) 1955 [Trenton, N. J.].

Reports from the literature show that the serum of patients in the acute phase of certain infectious diseases yields a precipitate when in contact with a solution of the C-polysaccharide of pneumococcus. This reaction is not restricted to pneumococcic disease. Its close time relationship with the acute phase of an illness has recently been clearly demonstrated in rheumatic fever in which laboratory tests for C-reactive protein are considered to provide the most sensitive indicator for the presence of rheumatic activity. The presence of C-reactive protein in the serums showed a close correlation with the intensity and duration of the inflammatory reaction of the host as indicated by elevated temperature and increased serial erythrocyte sedimentation rate. Despite certain limitations, the C-reactive protein test is proving useful in the management of the patient with rheumatic fever. The poorly defined normal range of the erythrocyte sedimentation rate in rheumatic fever has made evaluation of certain cases uncertain. C-reactive protein is of value in resolving some of these difficulties. Comparison of changes in the sedimentation rate and in C-reactive protein titers during fluctuations in activity discloses a tendency for the latter to respond more promptly. C-reactive protein usually disappeared during the early recovery period while the sedimentation rate was still elevated. The test is simple to perform and may be routinely employed, now that specific antiserums are commercially available.

Effect of Bacteriostatic Drugs on Tuberculous Lymph Nodes. P. Mutschler and G. Hasche-Klünder. Beitr. Klin. Tuberk. 114:406-435 (no. 4) 1955 (In German) [Berlin, Germany].

The cervical lymph nodes were studied in 283 guinea pigs experimentally infected with tuberculosis. The infection usually becomes generalized after the fourth week; this was verified in a preliminary series of 42 animals. The local injection treatment of the tuberculous nodes with Conteben, streptomycin (SM), and aminosalicylic acid (PAS) led to an objectionable amount of fibrosis; this offset the beneficial effects, which were convincing in the case of streptomycin but unsatisfactory in the cases of Conteben and aminosalicylic acid. Extirpation of the submental nodes did not affect the course of the disease. Streptomycin given orally after such extirpation was somewhat more effective than Conteben. Unfavorable effects of the postoperative impairment of lymphatic circulation became manifest when treatment with the drugs was discontinued. The most efficacious combination after lymphadenectomy was streptomycin and Conteben. Preparations of isonicotinic acid hydrazide (INH) were equally effective in the early stages, but in the later stages the effect was negligible. Neither of the two preparations of aminosalicylic acid tried was effective. In advanced stages, the various drugs had more marked effects on the other organs than on the lymph nodes, and, when treatment with the drugs was discontinued, the disease progressed faster in the nodes than in the organs. For successful treatment it was necessary to begin early and to persist. In general, the tuberculostatic effect was better the lower the initial infecting dose, the higher and more prolonged the concentration of the drug, and the greater the proliferative ability of the bacilli. These conditions are realized only in the early stages of lymphadenitis, and this explains the unsatisfactory results of treatment after there has been caseation. Postoperative treatment with bacteriostatics is therefore recommended in tuberculous cervical lymphadenitis in man.

Indications for Cavernostomy and Its Results. G. Salzer. Beitr. Klin. Tuberk. 114:381-384 (no. 4) 1955 (In German) [Berlin, Germany].

Cavernostomy was done in 46 tuberculous patients in whom the prognosis had been considered hopeless because the cavities were large or multiple and had proved resistant to standard treatment. Special care was taken to locate the incision as nearly as possible over the lesion; one or two ribs were resected, depending on the size of the cavity, and enough of the affected pleura and lung was removed to make a rather wide opening. A tampon is left in place five or six days, during which time there is usually a high fever; removal of the tampon and application of dressings with antibiotics brought the temperature back to normal, and thereafter neither the sputum nor the discharge from the fistula contained any more Mycobacterium tuberculosis. The presence of other cavities, large or small, may necessitate additional surgery, and a secondary operation is generally required to close the bronchial fistula. The latter proved unnecessary in 15 cases. Nine cases that terminated fatally included five in which the cavities were huge and bilateral. The cavernostomy proved lifesaving in many cases that had appeared hopeless after years of varied treatment.

Fifty Years of Malaria Control in the Panama Area. E. J. Dehné. Am. J. Trop. Med. 4:800-811 (Sept.) 1955 [Baltimore].

The Isthmus of Panama was an area of pestilence during the Spanish conquest of Central and South America. Its environment provided optimum breeding conditions for Anopheles albimanus, the principal malaria vector, because of the warm, humid climate and the heavy annual rainfall, usually varying from 70 to 130 in. The high relative humidity ranging from 60 to 99% saturation, ambient temperatures of from 63 to 97 F, waterlogged country, deforested lands, and innumerable swamps and water collections presented a serious challenge to efforts to control malaria when, in 1904, the United States launched its sanitary program. Hospital admission rates for malaria increased rapidly with the importation of large numbers of workers, reaching a peak of 821 per thousand employees in 1906. An equally serious problem was presented by yellow fever, which became epidemic in the Canal Zone in April, 1905. Efforts made by the engineers to secure the replacement of Gorgas, Carter, and their assistants, "who believed in the mosquito transmission theory," failed, and in July, 1905, the sanitation organization became an independent department and functioned with greater authority. Its first efforts were directed against yellow fever—then the immediate threat. They succeeded, just as they had in Havana, and no fatal case of yellow fever originating in the Canal Zone was reported after November, 1905. The procedures employed in the campaign to control malaria were (1) extensive and prophylactic use of drugs (at that time limited to quinine); (2) screening of houses and use of mosquito nets; (3) killing of adult mosquitoes in dwellings and the elimination of harboring places by cutting away sheltering underbrush; (4) the destruction of mosquito larvae and pupae by the use of oil and other larvicides; (5) the elimination of mosquito breeding places by filling, draining, training streams and admitting tide water; and (6) the use of permanent subsoil tiling and concrete-lined ditches in an attempt to drain all standing water. These procedures, which with certain modifications are still the key to malaria control, were increasingly successful as new drugs, insecticidal methods, and sanitation techniques became available. Malaria is now an uncommon disease in the Canal Zone, and urban communities in the Republic of Panama enjoy a considerable degree of freedom from infection. Information collected from malaria surveys during the last two decades shows, however, that the disease still persists in all the provinces of the republic. The Canal Zone, in fact, is bordered by areas where the recurring high prevalence of malaria serves as a continuing reservoir of infection from which an abundant perennial population of Anopheles mosquitoes can transmit the disease. Continuous and unremittent application of control measures by the individual and the community aimed at reducing the vector and treating the carriers is the only solution to the problem of malaria in the Panama area.

Amebic Hepatitis: Laboratory Findings and Treatment with Erythromycin. T. L. Nelson, H. H. Anderson and O. Thomas. Am. J. Trop. Med. 4:812-821 (Sept.) 1955 [Baltimore].

The disease entity often referred to as amebic hepatitis, which consists of an enlarged liver, tenderness in the right upper quadrant, and sometimes disturbed hepatic function detected by laboratory tests, is seen in a varying percentage of patients with intestinal amebiasis. It is not accompanied by hepatic amebic abscess formation. The lack of consistency in regard to the laboratory findings evident in reports dealing with this condition led to an effort to establish certain diagnostic criteria for amebic hepatitis by the thorough study of a few patients exhibiting this clinical picture. An attempt was made to determine the value of various laboratory procedures and their relative consistency in correlation with a recognizable clinical entity. Efforts were also made to rule out viral hepatitis and nutritional liver disease, sometimes confused with amebic hepatitis, by parallel pathological studies of liver biopsy specimens from representative patients. Finally, the efficacy of erythromycin and chloroquine therapy was investigated. A therapeutic response to either of these agents was regarded as confirming the diagnosis of amebiasis, but the question whether the infection was actively present in the liver itself or was secondary to intestinal Endamoeba histolytica infection remains unanswered. The 29 patients studied, all of whom presented evidence of deranged liver function in addition to proved intestinal amebiasis, were chosen from 371 patients with intestinal amebiasis in a 2,700-bed California hospital for the mentally retarded. The general pretreatment picture of amebic hepatitis seen in the liver biopsy specimens was that of subacute hepatitis that was frequently focal in distribution and usually most marked in the periportal areas, where it is shown chiefly by lymphocyte and plasma cell infiltration. Increased glycogen content was noted in some cases in the individual parenchymal cells. Post-treatment biopsy specimens in which a response to therapy appeared to be evident showed a diminution in the inflammatory reaction. Regeneration of parenchymal cells was shown by an increase in cell size and variations in nuclei. No amebas were found in any of the biopsy specimens. Evaluation of the efficacy of treatment on the basis of the patient's physical status and all the laboratory findings in each case showed a definitely favorable response in clearance of liver disease in 20 patients who were given erythromycin and in one who was given a combination of erythromycin and fumagillin. The nine patients resistant to erythromycin were subsequently put on chloroquine therapy with a favorable response in six, equivocal results in two, and no response in one. Six of the 12 tests and signs employed were significantly altered in one-third or more of the patients studied. The six most useful procedures, with the percentage of abnormal findings in each, were the cephalin flocculation reaction (two plus or more), 93%; liver biopsy with pathological findings, 82%; urine urobilinogen, 1:20 or greater dilution, 65%; elevated corrected erythrocyte sedimentation rate, 60%; liver enlarged and/or tender on palpation, 48%; and right lower pulmonary region showing pathological changes on x-ray examination, 36%. Objective findings such as those obtained in these patients deserve greater consideration as diagnostic criteria than the subjective impressions hitherto relied on.

Hepatitis Epidemic in Haderslev Eastern District in 1953-1954. I. Krogh. Ugesk. læger **117**:1219-1221 (Sept. 15) 1955 (In Danish) [Copenhagen, Denmark].

Of 44 patients with hepatitis admitted from February, 1953, to March, 1954, 42 are believed to have had epidemic hepatitis. The source of infection was established in 36 cases. The epidemic was benign. No cases of cirrhosis of the liver developed. Questionnaires sent 10 months after discharge of the last patient brought answers from 38 patients. Icterus had not recurred. Some patients reported slight fatigue, but there were otherwise no complications. The Takata-Ara reaction was positive in the grave cases where the icterus index and sedimentation reaction were high and the duration of illness prolonged, but it was also often positive in mild cases. Urobilin is always present in the urine in hepatitis except in milder cases and at the peak of the disease in severe cases.

SURGERY

The Cleft Lip–Cleft Palate Problem. H. M. Trusler, T. B. Bauer and J. M. Tondra. Plast. & Reconstruct. Surg. **16**:174-188 (Sept.) 1955 [Baltimore].

The authors analyze results obtained in 750 patients with cleft lip–cleft palate operated on during the last decade at the Indiana University Medical Center. Good surgical correction of the deformity is the chief factor in the rehabilitation of these patients. No single operation is adequate for all cases. The procedures that have given the best result for the various types of deformity are outlined. Much of the cleft lip–cleft palate surgery in the past has resulted in bad residual defects. Some of the surgery has resulted in the destruction of valuable tissue with excessive scarring and growth disturbance in the upper jaw and teeth. The cleft lip–cleft palate surgery of the present day is not producing serious growth disturbance in the maxilla. Orthodontia is a valuable adjunct in the rehabilitation of the cleft lip–cleft palate patient, but there are definite limitations in this field that must be recognized. Many of these patients have teeth so defective that orthodontia is futile. Fortunately these defects can be corrected by dental prosthesis. Speech therapy is an important factor in rehabilitation of the cleft palate patient. In the majority of cases, a good surgical repair at 18 months to 2 years of age gives good speech without specialized speech training, but the patient with a marked hypoplastic palate usually does not get good speech without the help of a speech therapist. Hearing defects have been a frequent cause of bad speech in cleft palate patients in the past. They are usually associated with repeated infections of the middle ear. It is not necessarily an integral part of the deformity. Early closure of the cleft palate with careful dissections and the aid of antibiotics reduces the incidence of this complication.

Reactivation of Rheumatic Fever Following Mitral Commissurotomy. E. H. Fell and R. T. Helman. A. M. A. Arch. Surg. **71**:512-517 (Oct.) 1955 [Chicago].

The authors review clinical and laboratory observations that might suggest reactivation of rheumatic fever in 100 consecutive patients who received surgical treatment for mitral stenosis. Attempts were made to free the patient from active rheumatic fever and other infections before surgery was undertaken. While blood studies proved important and helpful, they were not absolutely reliable. The sedimentation rate and antistreptolysin titer were normal in some patients, in whom microscopic studies on the auricular appendage revealed marked rheumatic activity. The patient should be well compensated and the circulating blood cells should be normal in number and quality before surgery is undertaken. A portion of the left auricular appendage is generally removed during mitral commissurotomy to allow the entrance of the operating finger. Histopathological studies were made on these appendages and permitted classification into the inactive, or the group showing no evidence of rheumatic heart disease, and the active group that showed rheumatic carditis. Forty-six or 52% of 88 auricular appendages showed rheumatic activity in the endocardium and myocardium on microscopic study. While histological evidence of rheumatic heart disease was most common in the younger age group (73% of those less than 30 years of age), it did occur at all ages. The four patients with reactivation of the rheumatic fever after mitral commissurotomy whose histories are presented were less than 25 years old. In one of these four patients, a 12-year-old girl, a mitral commissurotomy was done as a lifesaving procedure in the presence of what was believed to be active rheumatic fever. Microscopic study confirmed the clinical diagnosis of active rheumatic heart disease. Surgery confirmed the severity of the mitral stenosis and relieved the obstruction. The child is now receiving treatment for rheumatic fever and is progressing satisfactorily. All four patients who showed signs of reactivation have benefited from mitral commissurotomy. Since it is impossible to predict which patient will experience a reactivation, the authors advise prolonged postoperative antibiotic therapy or chemotherapy in patients in whom histopathological studies reveal rheumatic heart disease.

Prognostic Significance of Embolism with Regard to Commissurotomy for Mitral Stenosis. A. Actis-Dato and F. Morino. Minerva med. 46:255-263 (Aug. 4) 1955 (In Italian) [Turin, Italy].

A review of the history of 500 patients with mitral stenosis on whom Prof. A. M. Dogliotti performed a mitral commissurotomy revealed that 52 (10.4%) had had an embolism before the operation. An embolism occurred during or after the operation in 6 (11.5%) of these 52 as compared with its occurrence in 13 (3%) of the patients whose history did not reveal a previous embolism. Thus the risk of the occurrence of a postoperative embolism was three to four times greater for patients who had than for those who had not previously suffered an embolism. More than half the patients (three out of five) in whom an embolism occurred during the operation had previously had an embolism, whereas only one-fifth of the patients in whom an embolism occurred postoperatively had had a previous embolism. This different rate of embolic complications may have been due to the fact that the embolizing material present in the atrium or the valves before the operation and removed during its performance plays a great part in the causation of preoperative and intraoperative embolism, whereas a postoperative embolism is caused by new thrombotic material that is formed in the atrium or on the valves in the immediate postoperative course. Three (5.7%) of the 52 patients died as the result of intraoperative or postoperative embolism. In none of the 49 patients who survived did embolism recur months or even years after the operation. Only 3 (0.67%) of the other 448 patients died from the same cause. The authors conclude that a history of embolism in patients with mitral stenosis should not constitute, in the absence of other complications, a contraindication to commissurotomy because, although the operative risk is greater for such patients, it is not so great as to contraindicate the intervention. On the contrary, by improving the hemodynamic and cardiovascular conditions, the commissurotomy may not only offer the patient a better chance for survival but it may also prevent the occurrence of a new embolism.

Megaesophagus: Surgical Therapy. D. B. Effler and J. W. Rogers. A. M. A. Arch. Surg. 71:551-559 (Oct.) 1955 [Chicago].

Although the terms cardiospasm, achalasia, and megaesophagus are used interchangeably, megaesophagus is distinct from functional cardiospasm in that it is an organic disease that is associated with structural change. It is characterized by tonic contraction of the circular muscle of the terminal esophagus and proximal dilatation of part or all of the organ. The patient with megaesophagus gives a history of dysphagia and food retention. He may regurgitate undigested food from meals taken a day or two before. Total obstruction may occur when a bolus of meat or fibrous membrane (skin of a prune or apple) acts as a plug in the narrowed terminal outlet. These patients do not have peptic esophagitis or other forms of indigestion. The weight loss is directly proportional to the mechanical obstruction. Pulmonary symptoms are not uncommon, brought on either by aspiration or by the dilated esophagus, which reduces pulmonary function by compression. Radiographic studies show dilatation and impairment or absence of normal esophageal peristalsis. Attempts to relieve the tonic contraction of the cardiac sphincter and megaesophagus by sympathomimetic drugs, sedatives, antispasmodics, or procaine derivatives have been singularly unsuccessful. Direct surgical intervention is the treatment of choice for all patients who have true megaesophagus. The authors regard Wangensteen's operation, in which the terminal esophagus as well as the upper stomach is resected, as too radical. In the first 12 of the 32 patients in whom they resorted to surgical treatment for megaesophagus, they employed the Heineke-Mikulicz principle of esophagocardioplasty. However, all but three of these patients required a secondary operation to relieve the symptoms suggesting reflux esophagogastritis. Since 1952 the authors have employed transthoracic linear myotomy. The 20 patients operated on by this method obtained complete relief of dysphagia and food retention.

Unusual Manifestations of Parathyroid Adenoma. C. M. Lee Jr., W. T. McElhinney and E. A. Gall. A. M. A. Arch. Surg. 71:475-485 (Oct.) 1955 [Chicago].

Of a series of 11 cases of parathyroid adenoma, 4 were sufficiently unusual to merit comment. One of these occurred in a 7-year-old boy in whom blindness was a concurrent and apparently related complication. Another case was complicated by the development of a fatal fibrosarcoma in what is believed to have been originally an area of osteitis fibrosa cystica of hyperparathyroidism. In a third case, true neoplastic parathyroid adenoma occurred in association with secondary parathyroid hyperplasia, the latter the result of nephrocalcinosis. The fourth case was one of parathyroid poisoning—the so-called "hyperhyperparathyroidism" of Albright. The remaining cases followed conventional patterns. The authors cite evidence to the effect that parathyroid adenoma is frequently not recognized until the opportunity for cure has been lost. Only one of the 11 cases of parathyroid adenoma was discovered in connection with urinary calculus, although four of these patients had such calculi. Furthermore, the formidableness of parathyroid surgery has apparently so impressed some physicians that some patients may not receive proper treatment. One case is cited to prove this. Parathyroid surgery is a skill that should be within the reach of all who need it. The surgeon who undertakes parathyroid surgery should have adequate general training and should conscientiously prepare himself by careful study and, if possible, by cadaver dissection, before attacking his first parathyroid adenoma; but he should not deny a patient his chance of cure because the patient is unable to go to a distant center.

Treatment of Bleeding Esophageal Varices After Splenectomy. G. A. Hallenbeck and E. Shocket. A. M. A. Arch. Surg. 71:581-587 (Oct.) 1955 [Chicago].

Portal decompression by anastomosis with the caval venous system is at present the preferred treatment for bleeding esophageal varices in patients with portal hypertension. It may or may not be possible in patients after splenectomy or when the splenorenal shunt has failed. The problem is one of determining whether branches of the portal system exist that are large enough and in suitable position for anastomosis to the vena cava. This cannot be done without exploration and should not involve a tedious and hazardous dissection that may be of no avail. A plan is presented whereby a brief laparotomy allows exploration of the abdomen, examination of the liver, palpation of the porta hepatis, measurement of portal pressure, and obtainment of a portal venogram. On the basis of these data a decision is made either to attempt a portacaval shunt or to abandon this approach. The procedure of choice when a shunt cannot be done is uncertain at present. The authors resorted to transesophageal ligation of varices in nine patients. They use Crile's technique, avoiding incisions into the diaphragm to prevent interference with the normal "pinchcock" mechanism in the hope of preventing development of regurgitating esophagitis. The period of postoperative observation is short in all these patients. If remissions afforded by Crile's procedure prove to be too few or too brief, the authors are prepared to turn to esophagogastric resection, perhaps of the type described by Allison and da Silva, in which an esophagojejunostomy is established.

Treatment of Oesophageal Varices in Portal Hypertension by Means of Sclerosing Injections. R. Macbeth. Brit. M. J. 2:877-880 (Oct. 8) 1955 [London, England].

Of 30 patients with esophageal varices who were treated by the author with injections of 3 to 4 cc. of 5% sodium morrhuate at each venipuncture carried out with the aid of a large esophagoscope, 14 had liver damage and 16 were without liver damage. By sliding the esophagoscope downwards for about a centimeter, the maneuver was repeated four or five times at any one session. The treatment usually was repeated every one to two weeks until no veins remained uninjected. Further and immediate hemorrhages, as a result of venipuncture, could be avoided and controlled by the use of hydrostatic bags. Substernal pain occurred but was slight. Venous embolism and allergy to the injection fluid were not observed. Results of injection therapy were disappointing in the patients with severe liver damage. It was often possible to control a particular hemorrhagic incident and apparently to prolong the patient's life, but these patients readily passed into a vicious circle of liver damage with jaundice leading to hemorrhage, which in its turn seemed to predispose to liver failure. It is, however, always worth while to attempt to control even the least hopeful case, especially if active bleeding has recently occurred, until the diagnosis becomes clear or until the patient goes into liver failure. All the patients without demonstrable liver damage remained alive and well for from 11 years to four months after being controlled. Splenectomy makes the veins more readily controllable and should be carried out as an adjunct to injection therapy. Treatment of esophageal varices by sclerosing injections is a safe and satisfactory alternative to major surgery.

The Role of ACTH, Cortisone and Hydrocortisone in Surgery. W. E. Abbott, H. Krieger and S. Levey. Ann. Int. Med. 43:702-730 (Oct.) 1955 [Lancaster, Pa.].

On the basis of an extensive review of the literature (222 reports), the authors summarize both the therapeutic benefits and the dangers associated with the use of corticotropin, cortisone, and hydrocortisone in surgical patients. The first and largest part of this report is concerned with the use of corticotropin, cortisone, and hydrocortisone as therapeutic agents (1) for the production of remissions and gaining of time for preparation of patients undergoing surgery, for instance in ulcerative colitis and hemolytic anemia; (2) for the treatment of surgical disorders and complications such as pancreatitis, tetanus, thrombophlebitis, thyroid crisis; (3) for patients with adrenal insufficiency or inability to respond normally to stress because of prior therapy with corticotropin or adrenal steroids (patients with adrenal cortical hypofunction [Addison's disease], those who have been subjected to adrenalectomy, patients with Waterhouse-Friderichsen syndrome, and those who had suppression of the pituitary or the adrenals due to previous endocrine therapy); (4) for study of endocrine therapy in shock and peritonitis; and (5) for partial or total adrenalectomy. The second part of this review takes up the factors governing the metabolic response of the patient to stress and the third part, the contraindications and dangers involved in the treatment with corticotropin and the adrenocortical hormones. In patients who have acute or chronic insufficiency as the result of disease or surgical extirpation of the adrenal glands, the use of cortisone or hydrocortisone is mandatory. In other patients these hormones may be of value in avoiding operation, improving the preoperative status, or relieving some of the postoperative complications. It should be remembered that, when these hormones are given to surgical patients, they can produce a wide variety of responses, many undesirable. It is also apparent that more studies are needed before these compounds can be used for some of the conditions for which they have been advocated.

Surgical Considerations of Dissecting Aneurysm of the Aorta. M. E. De Bakey, D. A. Cooley and O. Creech Jr. Ann. Surg. 142:586-612 (Oct.) 1955 [Philadelphia].

Reports on dissecting aneurysms of the aorta show that this disease is associated with grave disturbances and a rapidly fatal course in from 75 to 90% of the patients. Its causation has not been determined precisely, but studies of the pathogenesis and pathology suggest that the underlying predominant lesion is degeneration of the elements of the media. The dissection commonly begins as a transverse tear in the intima and media a few centimeters above the aortic valves or in the descending thoracic aorta near the origin of the left subclavian artery. Once this occurs, separation of the intramural layers of the aorta by the forceful stream of blood produces dissection, usually at the junction of the middle and outer thirds of the media, and progresses distally, involving all or a portion of the circumference of the aorta. While the extent and course of dissection vary, in general three patterns of the disease may be recognized. In the most acute and severe form there is rapid dissection and terminal perforation through the adventitia, with death in a few hours or days. In the subacute type the process may begin abruptly but then progress gradually over a period of days or weeks with terminal rupture and death. In the chronic form, reentry of the dissected passage into the lumen of the aorta usually takes place thus forming a double-barreled aorta. Increasing awareness of the problem and recognition of the characteristic clinical manifestations (acute arterial insufficiency of the lower extremities) should lead to more frequent early diagnosis. Roentgenologic studies are particularly valuable in supporting the diagnosis, and it often can be confirmed by angiography, which characteristically reveals a double shadow representing the true and false aortic lumens. Treatment has been almost entirely symptomatic and unsatisfactory, and the few previous attempts to attack the problem surgically have all failed. The rationale of the surgical procedures employed by the authors in five men between the ages of 43 and 72 years and in one 40-year-old woman with dissecting aneurysm of the aorta is based on nature's method of healing in which spontaneous reentry of the dissected passage at some distal point in the aorta permits restoration of peripheral circulation and removes the increasing tension on the outer wall, thus preventing its rupture. This may be achieved by one of several surgical approaches utilizing essentially similar underlying principles. In cases in which the dissection begins on the ascending or descending part of the aortic arch, the creation of a reentry passage into the aortic lumen above, with obliteration of the false passage below, is achieved by cross clamping the descending thoracic aorta, dividing it completely between clamps, obliterating the false passage below by approximating the outer and inner layers, excising a small segment from the inner intimal and medial layer above to produce reentry of the outer lumen, and then completing the procedure by end-to-end anastomosis. In other cases in which the lesion is fairly well localized or arises at or below the level of the left subclavian artery, this procedure may be combined with excision of the segment involved in the origin of the dissection and completed with end-to-end anastomosis or insertion of an aortic homograft. In four of the six patients recovery was uneventful and results were gratifying. The two other patients died; in one, death occurred on the eighth postoperative day from rupture of the outer wall of the dissecting aneurysm, presumably resulting from inability to control hypertension. The other death was caused by the consequences of ventricular fibrillation precipitated by tension pneumothorax and hypothermia.

Arterial Homografts: A Comparison of the Results with End-to-End and End-to-Side Vascular Anastomoses. R. R. Linton and C. V. Menendez. Ann. Surg. **142**:568-585 (Oct.) 1955 [Philadelphia].

An analysis of the results obtained by the authors with 20 arterial homografts, preserved by the frozen irradiated technique and implanted by the end-to-end method of anastomosis to restore the continuity of the femoral arteries in 16 patients with segmental occlusion of these blood vessels secondary to atherosclerosis, revealed a disappointingly low number of successes, since 12, or 60%, had failed within six months, and only 8, or 40%, were still functioning after periods of 8 to 20 months. The mean age of the patients in whom the grafts remained open was 63 years, while 58 years was the average age of the patients in whom the grafts failed. The length of the grafts varied from 15 to 60 cm. with a mean of 39 cm. for the open grafts as compared to 30 cm. for the failures. The older patients and the longer grafts seemed to have done better. The results obtained with the Cockett modification of the Kunlin method of the end-to-side type of anastomosis in a comparable group of 16 arterial homografts, preserved by the same method and implanted as bypass grafts in 15 patients with similar but more extensive lesions of the femoral arteries, showed a definite improvement, since none of the grafts became occluded and the only failures occurred secondary to sepsis in two patients. A longer follow-up of the patients with end-to-side type of anastomosis is necessary to obtain a true evaluation of this method of arterial anastomosis; the 13 (81%) of the 16 grafts that are still functioning have been followed only for from one to eight months. The mean age of the patients in whom the grafts remained open was 60 years, while 57 years was the average age of the patients in whom the grafts failed. The length of the grafts varied from 23 to 60 cm., with a mean of 41 cm. for the open grafts as compared to 55 cm. for the failures. It should be noted that the lesions in most of the patients in whom the end-to-side anastomosis technique was used were much more extensive than in the group with end-to-end method, so that in most of the former it would have been impossible to implant the homografts by the latter method. The end-to-side method of arterial anastomosis proved of great value in anastomosing the limbs of aortic bifurcation grafts to the iliac, femoral, or popliteal arteries. The incidence of immediate thrombosis of these anastomoses, as compared to the ones constructed by the end-to-end method, was reduced from 21 to 3%. It is recommended that the end-to-end method of anastomosing an arterial homograft, preserved by the frozen irradiated technique, to arteries such as the external iliac, femoral, and popliteal arteries, be abandoned in favor of the end-to-side method described and that the end-to-end method be reserved for large arterial anastomoses such as for the aorta and common iliac arteries.

The Use of Plastic Fabrics as Arterial Prostheses. E. J. Poth, J. K. Johnson and J. H. Childers. Ann. Surg. **142**:624-632 (Oct.) 1955 [Philadelphia].

Experiments in animals and limited trials in human beings showed that arterial prostheses made from inert synthetic fabrics have definite advantages over arterial homografts in the repair of major arterial defects. The materials are readily available and inexpensive. The implants can be tailored to fit the vessels of the host. Nylon is the best of the materials studied. Nylon prostheses with multiple thickness walls are as well tolerated as a single thickness of fabric and assure a greater factor of long-term safety. The prosthesis used consists of an "inner liner" or inner tube, and an external "wrap around." The inner liner is tailored accurately to fit the dimensions of the host's artery. The outer, reinforcing wrap around is applied after the inner liner has been sutured in place, the circulation reestablished, and the conduit demonstrated to have no leaks. The nylon fabrics are carefully "boiled off" in clear water and detergent solutions and then rinsed repeatedly in distilled water before being fashioned into the prosthesis. Since these prostheses can be made aseptically while the segment of vessel to be replaced is being excised, there is neither loss of time nor the need to have any materials available other than the fabrics to be utilized. Multiple layered prostheses have been implanted to replace peripheral and abdominal arteries, including both the bifurcation of the aorta and iliac arteries in their entirety. The immediate results are generally satisfactory but determination of ultimate value must depend on long-term clinical observation. Further clinical trial is justified.

NEUROLOGY & PSYCHIATRY

Immunity to Poliomyelitis: An Investigation Among School Children at Como in Western Australia. D. J. R. Snow, G. R. A. Raad, J. F. Woolcott and others. M. J. Australia **2**:485-488 (Sept. 24) 1955 [Sydney, Australia].

After many years of sporadic disease, an epidemic of poliomyelitis occurred in Perth during 1948. The attack rate was approximately 60 per 100,000 of the population, and the total number of notifications recorded was 311. Half the patients were aged under 10 years. The vast majority of all the cases notified were paralytic, the case fatality was 8%, and the proportion of survivors with residual paralysis was about 40%. The disease prevailed in endemic form during the next five years, with an annual attack rate of 11 or 12 per 100,000, and a second epidemic developed in February, 1954. The attack rate was about 70 per 100,000 of the population, 436 notifications being registered. About 36% of all patients were less than 10 years old. Paralysis developed in only 45% of the patients. The case fatality was 1%, and survivors with residual paralysis constituted about 20%. Fecal specimens from 10 of the earliest cases were found to contain poliomyelitis virus with the characteristics of the type 1 or Brunhilde strain. This epidemic was unique in that, while it was in progress, large crowds assembled on six successive days to witness various functions connected with the Royal visit and that, despite these increased opportunities for infection, increased incidence of disease did not occur. Serologic tests for immunity were undertaken at periodical intervals throughout the epidemic on the children of one school to find out what change, if any, took place in the relative proportion of immune subjects. During the course of the epidemic, 46% of children at the school had high antibody levels to type 1 virus, but two subsequent examinations carried out during the ensuing five months revealed little change in this proportion. These findings were unexpected. Where a progressive increase in the proportion of immune subjects was anticipated, no such increase was found. There are several arguments against the suggestion that the investigation was commenced too late and that the majority of those exposed became infected before the first blood test. The investigation began within a week of the detection of clinical poliomyelitis in the school. The epidemic itself had been in progress for less than five weeks. Poliomyelitis virus was present in the school sewage when the investigation was undertaken. The serums of over half of all children tested gave negative findings, that is, virus was present in the environment of many susceptible children without serologic indications of progressive infections. It is possible also that the transference of infection was interrupted by the intense hand-hygiene campaign and other control measures that were instituted during the epidemic. While this may have played an important part in reducing the number of infections, it seems unlikely that it was the entire explanation. It is possible that the laboratory techniques used had limitations and failed to disclose immunizing infections of minor degree.

Towards Safer Angiography. C. B. Sedzimir. J. Neurosurg. **12**:460-467 (Sept.) 1955 [Springfield, Ill.].

The 273 carotid angiograms reviewed were performed on 169 patients by the percutaneous method under general anesthesia. Arteriodone, a 42.5% watery solution of diethanolamine salt of diodone, was used in all cases. There were no deaths and no complications in this series. This record is compared with literature reports on 3,128 angiograms performed since 1950, in which there were 22 deaths (0.7%), 23 patients (0.7%) with permanent complications, and 58 patients (1.9%) with transient complications. Only one other series in this group, 150 angiograms performed by Ver Brugghen, was free from complications. In the author's opinion the most important factors making for the safety of the technique are (1) the employment of general anesthesia, (2) the small amount of fluid injected at a very slow rate between the lateral and axial exposures, and (3) the withdrawal of the needle from the artery for the 10 minutes during which the plates are developed and inspected. It seems highly significant that both Ver Brugghen's and the present series were performed on anesthetized patients and that they were the only two free from all complications. The use of anesthesia was the most outstanding single factor in the technique by which these two series differed from all the others reviewed.

Early Diagnosis of Phenylpyruvic Oligophrenia. W. Frischknecht. Schweiz. med. Wchnschr. **85**:969-970 (Oct. 1) 1955 (In German) [Basel, Switzerland].

A form of oligophrenia in which the urine contains phenyl pyroracemic acid was first described in 1934. This urine assumes an olive green color when a few drops of a 5% solution of ferric chloride is added. This reaction of the urine, which persists for a few minutes, is pathognomonic for phenylketonuria, and so far has never been observed in persons of normal intelligence. About 90% are either idiots or imbeciles, and the remaining 10% are of slightly higher intelligence but still defective. While nothing definite is known about the incidence of this form of oligophrenia in Switzerland, the author says that 200 cases were found among 20,000 institutionalized mental defectives in the United States. Recently it has been established simultaneously by several investigators that the biochemical anomaly of this form of oligophrenia can be corrected by a diet with a low phenylalanine content. This diet has a favorable effect on the mental development, epileptiform convulsions cease, the electroencephalogram becomes normalized, and the extrapyramidal disturbances show improvement. This suggests a pathogenetic connection between the cerebral disturbances and the biochemical anomaly. Infants with congenital phenylketonuria may show normal development for the first six or seven months. During this period only the ferric chloride test of the urine will reveal the diagnosis. The peculiar odor of the skin, which suggests the odor of mice, will appear suspicious only to those who have had experience with this defect, particularly if the child is light blond, has a pasty appearance, and shows a predisposition to dermatitis. In infants over 6 months of age, signs of mental retardation will become evident. Growth of the cranial portion of the skull is retarded in comparison with the growth of the facial part (microcephalism combined with cherubic face). Choreoathetoid and myoclonic forms of hyperkinesia may appear, and epileptiform convulsions and rigidity are frequent. The author presents observations on two children with this form of oligophrenia. Both children had a pasty appearance and were mentally retarded. Photographs show the cherubic expression, and in both the ferric chloride test of the urine was strongly positive. In one of the children hypothyroidism had been suspected at first. No satisfactory infant diet with a low phenylalanine content is as yet available in Switzerland, but the author tried a diet with a low protein content, in which milk was restricted and meat and cheese completely eliminated. This diet was tried in one of the two children and apparently produced some improvement.

Stilbamidine Isethionate Therapy of Tic Douloureux. B. Woodhall and G. L. Odom. J. Neurosurg. **12**:495-500 (Sept.) 1955 [Springfield, Ill.].

The use of stilbamidine in tic douloureux was begun on the basis of the observation that in patients treated with therapeutic doses of stilbamidine varying degrees of hypesthesia and hypalgesia develop over the face and over the upper cervical sensory dermatomes from two to five months after the termination of therapy. When administered properly, stilbamidine is not otherwise toxic, but solutions of the drug become markedly toxic and progressively lose their therapeutic potency upon exposure to ultraviolet radiation. When such unstable solutions are used, irreversible hepatic and renal injury may occur. The present series of 41 patients were selected from a total of 71 patients treated in the Duke Hospital over the years 1953 and 1954 for the pain of classical tic douloureux. The period of post-therapy observation has ranged therefore from two years to nine months. Stilbamidine isethionate, 0.15 gm., was freshly dissolved in 150 cc. of 5% glucose and distilled water and given intravenously over a period of one hour. Transient shock-like reactions associated with a more rapid administration of this drug have been reported but were not observed in this group. The course of therapy consisted of 10 daily injections for a total dosage of 1.5 gm. of the drug. The pain of tic douloureux was controlled in 36 of the 41 patients. In a small percentage of cases, unpredictable formication and paresthesias occur over the face, which tend to decrease the potential value of this therapeutic agent. The deferred action of the drug in patients with severe and unrelenting tic pain is a severe trial to both patient and physician and may necessitate provisional methods of control before the onset of the chemical neuropathy. Although this drug in its intravenous form may not be the definitive medical therapy for tic douloureux, it represents a very valuable adjunct to the care of this often complex pain syndrome.

PEDIATRICS

Action of ACTH on Immunization and on Protein Picture of Children Vaccinated with Diphtheritic Anatoxin. E. Bottone, L. Poli and G. Fascione. Arch. ital. pediat. e puericolt. **17**:263-297 (No. 4) 1955 (In Italian) [Bologna, Italy].

The authors report the results of studies on normal children vaccinated with diphtheritic anatoxin in whom they studied the action of corticotropin (ACTH) on the process of immunization. Ten children were given, commencing on the day of the vaccination, 30 mg. of the hormone for 10 days and 15 mg. for another 10 days. Nine children served as controls and received injections of isotonic sodium chloride solution in daily doses that were equal to those of corticotropin. Blood samples were collected from all the children before and 10, 20, and 30 days after the vaccination. Comparison of the average increase of the serum antitoxin titer in the two groups of children did not reveal significant changes in the first 20 days, but after 30 days the increase was more marked in the children who had received the hormone. The antitoxin titer increase was marked (100 times greater than the initial value) in 60% of them, moderate (50 times greater) in 30%, and slight in 10%. The respective figures for the controls were 40%, 20%, and 40%. These results, unlike those of other workers, indicate that corticotropin does not inhibit the immunization process. Electrophoretic studies showed a constant and progressive decrease in the total protein level of children who received the hormone, whereas in the controls the most marked fall occurred on the 10th day after the vaccination. In both groups the changes in the total protein level were correlated with the variations in the albumin and globulin level. The decrease in the albumins was less marked in the children who had received the hormone, in whom the globulins had increased slightly by the 10th day, returned to the initial values by the 20th, and decreased slightly by the 30th. In the controls the globulins had increased by the 20th day and decreased below the initial values by the 30th day. No parallelism was found in the two groups of children between the gamma globulin and the antitoxin levels.

Immobilization of Extension Supracondylar Fractures of the Elbow in Children. D. G. Wright. Glasgow M. J. **36**:294-297 (Sept.) 1955 [Glasgow, Scotland].

When supported by a collar-and-cuff sling, the reduced supracondylar fracture is subjected to deforming forces that may result in redisplacement. First, since the plane of the shoulder joint lies at an angle of 60 degrees to the coronal plane of the body, approximation of the flexed arm to the front of the thorax results in internal rotation of the distal fragment. Second, the inward pressure of garments upon the proximal fragment, in association with the counter-pressure of the thoracic wall upon the medial epicondyle, predisposes to displacement laterally, particularly if the fracture line slopes upwards and laterally. Finally, to take postreduction films, the radiographer must undo the collar-and-cuff and subject the limb to movements liable to cause redisplacement of an unstable fracture. To reduce the risk of redisplacement, the author cuts a cross into the center of a rectangular piece of Gamgee. The patient's head is passed through the cross, and the fore and aft flaps of Gamgee are bandaged lightly to the chest wall to form a protective waistcoat. A long calico bandage is centered across the shoulder of the unaffected side, and the two ends are carried across the patient's back to cross one another. The fracture is then reduced by the standard Robert Jones technique and a posterior plaster slab applied. The patient is then rolled onto the unaffected side and the limb immobilized in the desired position by means of the calico bandage, which is taken across the chest, looped through the bandage on the sound shoulder, and tied in a convenient position on the front of the chest. The patient is dismissed from the hospital within a few days, with clothing worn over the affected limb draped loosely. No redisplacement resulted in more than 50 patients in whom the author employed this method of immobilization.

UROLOGY

Studies in Urolithiasis: IV. Urinary Glucuronosides and Calcium Phosphate. E. L. Prien and B. S. Walker. J. Urol. 74:440-446 (Oct.) 1955 [Baltimore].

For the last 20 months acetylsalicylic acid has been given orally in tablets of 2 gm. daily in three divided doses to 19 ambulatory patients with histories of recurrent calcium-containing calculi. The drug was given in addition to the usual dietary measures. Comparison of plain urograms of the kidneys, ureters, and bladder, excretory urograms, or both, obtained after a year or more of treatment, with those obtained before treatment with acetylsalicylic acid was started revealed that no growth or new formation of calculi occurred over a period of 12 to 18 months in 17 of the 19 patients. A major objective in the treatment of these patients was the prevention of supersaturation of the urine with stone-forming substances. Evidence from biochemical literature indicates that the solubility of calcium phosphate in the urine is increased by the presence of higher concentrations than normal of urinary glucuronosides. This was the principle of the authors' new therapeutic approach to the problem of recurrent calcium-containing stones. The output of total glucuronic acid ranged from 0.2 to 0.9 gm. per 24 hours in the patients who had not started aspirin therapy. While the patients were receiving aspirin, the outputs ranged from 0.6 to 2.2 gm. per 24 hours. It was almost always possible to double the output and frequently to triple and quadruple it. In one of the patients, there was a slight increase in size of his small renal calculi after 18 months of treatment; it seems reasonable to conclude that he was a poor glucuronoside producer or that there was excessive destruction of glucuronosides by bacterial action. The one remaining patient was a complete therapeutic failure, although his glucuronoside production was excellent. This patient differed from the other 18 in the composition of his calculi. The other patients had produced stones composed chiefly of the usual type of calcium phosphate, or apatite stone. The patient in whom the therapy failed had calculi composed of acid calcium phosphate; this compound occurs in less than 2% of human renal calculi. There have been relatively few undesirable side-effects of aspirin therapy in the authors' patients. Of the numerous substances that augment the output of glucuronosides in the urine, derivatives of salicylic acid such as acetylsalicylic acid and salicylamide appear to be highly effective and relatively nontoxic.

Prostatic Carcinoma: Treatment of Advanced Cases with Intravenous Diethylstilbestrol Diphosphate. R. H. Flocks, H. Marberger, B. J. Begley and L. J. Prendergast. J. Urol. 74:549-551 (Oct.) 1955 [Baltimore].

Diethylstilbestrol diphosphate was given to 66 patients with carcinoma of the prostate. Thirty-four of these, with advanced disease, had failed to respond or had become refractory to the usual estrogens. Twelve patients with advanced carcinoma of the prostate had had no previous hormone therapy. In the remaining 20 patients with less advanced disease, diethylstilbestrol diphosphate was used as an adjunct to other therapy. The drug was administered in doses ranging from 250 mg. to 1,250 mg., the average dose being 500 mg., given in an intravenous infusion of isotonic sodium chloride solution or dextrose 5% in water, the total volume of which ranged from 200 to 500 cc. The average rate of administration was 300 cc. per hour, and generally one or two infusions were given daily. A course of therapy ranged from the common of 5 days to the exceptional of 20 days, depending on the rapidity of the clinical response. Repeated courses were given usually at monthly intervals. The number of treatment courses varied from 1 to 11. Thirty-eight patients had only a single course. The highest total dose administered was 31,500 mg. Of the 46 patients with advanced disease, 7 improved as evidenced on palpation of the prostate by softening or decrease in size of the gland, 38 were unchanged, and one became worse. Only one patient showed demonstrable evidence of improvement of evident pulmonary parenchymal metastases, and 12 showed progression of bony metastases despite therapy. Of 31 patients with elevated serum acid phosphatase levels, these levels returned temporarily to normal in 20, while further elevation was observed in 4 at the completion of treatment. The untoward effects were limited to irritability of the gastrointestinal tract and were observed in 17 patients. These untoward effects could largely be prevented or reduced by very slow initial infusion of the drug. The results obtained showed that the drug was relatively nontoxic and that very high blood levels could be obtained. It was also shown that either the elevated blood level or possibly additional concentration within the area of the prostate had an effect over and above ordinary estrogen therapy. While diethylstilbestrol diphosphate given intravenously is well tolerated and benefits an appreciable percentage of patients with advanced carcinoma of the prostate, even after other estrogens have failed, further studies with regard to its mode of action, duration of effect, and optimum dosage are indicated.

THERAPEUTICS

Therapy of Ascariasis with Piperazine. H. W. Brown. Am. J. Trop. Med. 4:947-952 (Sept.) 1955 [Baltimore].

Piperazine (diethylenediamine) has been shown to be remarkably effective in the treatment of Ascaris lumbricoides infections. Three groups of children so infected were treated according to different dosage schedules for one, two, or five days to see whether treatment with a larger dose for one or two days would be as effective as treatment with smaller doses for longer periods. A single-dose treatment would obviously be advantageous for public health mass treatment campaigns or for use in hospital outpatient clinics. Adults have been given from 2.0 to 3.5 gm. of piperazine hexahydrate daily for 14 days without ill-effects; consequently, a maximum dose of 3.5 gm. for 1 or 2 days was considered safe for use in these trials. Proof that treatment for two consecutive days was much more effective than treatment for one could be followed by a program in which a physician would administer the first dose and give the patient an additional safe amount to be taken at home the next day. The piperazine citrate used in this study was supplied as a flavored syrup, each cubic centimeter of which contained 100 mg. equivalent of piperazine hexahydrate. Each dose was followed by an equal amount of water poured first into the graduate used in measuring the dose and then into the paper cup from which it was taken, so that none of the syrup was left. The one-day and two-day treatments were given from one and one-half to three hours after breakfast. Divided doses, one in the morning and one in the afternoon, were used in the five-day treatment. No special diet was suggested, pretreatment fasting was not required, and no purgatives were used. The pleasant-tasting syrup was readily accepted; only one patient complained of side-effects consisting of nausea and abdominal cramps; and no child interrupted his course of therapy, although many of them walked considerable distances to and from school. The doses given varied according to the patient's weight, ranging from 2 to 3.5 gm. daily for the one-day and two-day treatments and from 0.5 to 2.0 gm. daily for the five-day treatment. The cure rates in the various groups were: one-day treatment, 74%; two-day treatment, 94%; and five-day treatment, 91%. The one-day treatment thus proved less effective than either the two-day or the five-day treatment. The two-day and five-day treatments were almost equally effective; however, the two-day treatment not only is shorter but also takes about 50% less of the drug.

Triethylene Melamine in Hodgkin's Disease (Malignant Lymphogranulomatosis). H. Høst and G. Qvigstad. Nord. med. 54: 1383-1385 (Sept. 8) 1955 (In Norwegian) [Stockholm, Sweden].

Five patients with Hodgkin's disease (lymphogranulomatosis) were treated with triethylene melamine (TEM) in Vestfold Hospital. There was no effect in the two previously untreated patients, one with localized form of Hodgkin's disease and good general condition and one with an extensive glandular swelling and slightly impaired general condition; both later reacted well to roentgen treatment. The three patients with generalized forms of the disease received continuous treatment for from 8 to 17 months, with clinical remissions for from 6 to 15 months. In two of the cases no hematological changes were demonstrable before the terminal stage; in one case an intractable aplastic anemia developed after a total dose of 85 mg. of TEM, in the other case leukopenia and thrombocytopenia were demonstrated shortly before death after a total dose of 420 mg. of TEM. The hematological changes are ascribed to roentgen and TEM treatment. In the third case the blood values remain satisfactory after 15 months' treatment, during which a total dose of 275 mg. has been administered. In advanced generalized or radioresistant forms of Hodgkin's disease attempted treatment with triethylene melamine is indicated, with close hematological control. To what extent the substance can be given as a maintenance treatment is still an open question.

PATHOLOGY

Cytology of Esophageal Washings: Evaluation of 364 Cases. W. D. Johnson, L. G. Koss, G. N. Papanicolaou and J. F. Seybolt. Cancer 8:951-957 (Sept.-Oct.) 1955 [Philadelphia].

The authors report the results of their studies of one or more esophageal washings of 364 patients with malignant and benign diseases of the esophagus, the final diagnosis of which was established either by pathological examination of tissue or by satisfactory radiological and clinical evidence. Of 148 patients with malignant tumors primary in the esophagus, cytological examination yielded a positive diagnosis of cancer in 103 (69%). In 18 patients (12.2%), cytological examination yielded a diagnosis of "suspicious." In 27 patients (18.2%) a report of "negative" smears was made. Thus in 30.4% of cases it was not possible to make a definite diagnosis of cancer of the esophagus by the cytological method. The failure in most cases was caused by the absence or extreme scarcity of tumor cells in the submitted specimens. Of 81 patients with malignant tumors primary in organs other than the esophagus, mainly in the stomach, cytological examination yielded a positive diagnosis of cancer in 25, whereas in 44 a report of "negative" or "insufficient for diagnosis" and in 12 one of "suspicious" was made. In 3 of the 135 patients in whom no malignant tumor was demonstrated, the cytological diagnosis of a positive smear was made, representing 0.8% of the total of 364 patients. In 125 of the 135 patients, cytological examination yielded a report of "negative," and a report of "suspicious" was made in 7. In 85 (57.4%) of the 148 patients with malignant tumor primary in the esophagus, both cytological examination and biopsy yielded a positive diagnosis of cancer; in 32 patients (21.7%) biopsy yielded a positive diagnosis of cancer, while cytological examination was negative or inconclusive. In 18 patients (12.2%) cytological examination yielded a positive diagnosis of cancer, while biopsy was either negative or not done. In 13 patients (8.8%), biopsy was either negative or not done and cytology was negative or inconclusive, so that neither method established the diagnosis. The authors believe that cytological examination of esophageal washings is useful and dependable. It is not suggested that it can replace biopsy; however, it may prove of particular value in cases in which, for various reasons, biopsy is not practical. Concomitant use of cytological examination and biopsy may spare the patient the suffering and expense of a repeat esophagoscopy. Special attention is drawn to the cytology of severe esophagitis of long standing, which is the most important source of diagnostic errors.

Studies in Rheumatic Fever: I. The Clinical Significance of the Aschoff Body Based on Morphologic Observations. C. G. Tedeschi, B. M. Wagner and K. C. Pani. A. M. A. Arch. Path. 60:408-422 (Oct.) 1955 [Chicago].

The authors report observations made on 400 biopsy specimens from left auricular appendages removed in the course of surgical intervention on the hearts of patients with a preoperative diagnosis of chronic mitral valvular disease of rheumatic origin. The pathological findings led to a classification of the cardiac biopsy specimens into two main categories, namely, active rheumatic carditis and healed or healing rheumatic carditis. Of the 400 appendages, the rheumatic process was considered active in only 8 (2%), with an exudative type of inflammatory reaction in the Aschoff body, in the endocardium, or in the myocardium (independently from mural thrombosis); alteration of collagen fibers; and presence of "fibrinoid" in the ground substance. Damage of myofibers was a concurrent change, and, since these unequivocal signs of acute inflammation were in every instance accompanied by endocardial and myocardial fibrosis, this combination of recent and old lesions was interpreted as representing a condition of chronic rheumatic carditis with reactivation. In the absence of these changes and in the presence of senescent Aschoff bodies and of endocardial or myocardial fibrosis, the rheumatic carditis was considered in a healed or healing stage; of the 392 appendages in this category, 67 (16.8%) showed Aschoff bodies. It is indicated that the Aschoff body *per se* is not a reliable exponent of rheumatic activity. In the life cycle of rheumatic carditis, the earliest injury is a fibrinoid alteration of the ground substance. Exudative inflammatory reaction, myofiber necrosis, swelling, and fragmentation of collagen fibers are associated features of the early phases of the rheumatic process. The transition to the chronic phase is characterized by the appearance of senescent changes within the Aschoff body and progressive endocardial and myocardial fibrosis. Reactivation of the rheumatic process is accompanied by the appearance of fresh lesions as shown in the active carditis group by the association of old and recent alterations. Except for elevation of the erythrocyte sedimentation rate, which correlated with the pathological classification, no clinical or laboratory indication of preoperative activity was found in any of the patients, including the eight who showed unequivocal evidence of acute carditis in the biopsy specimen. The postoperative course also failed to reveal in any of the patients signs, symptoms, or laboratory data suggesting recrudescence of the rheumatic process, and patients with microscopically active disease did not show any increase in operative mortality or morbidity as compared with patients with microscopically inactive disease. It is suggested that the discrepancies between the morphological and clinical manifestations of rheumatic activity can be caused by the widespread therapeutic use of steroid hormones and antibiotics. These agents may alter the individual response with little effect on the underlying disease process. In 22 patients who died shortly after the surgical intervention, the findings in the biopsy specimens agreed with those observed in other portions of the heart.

Studies in Rheumatic Fever: II. Origin of Cardiac Giant Cells. B. M. Wagner and C. G. Tedeschi. A. M. A. Arch. Path. 60: 423-430 (Oct.) 1955 [Chicago].

Two types of cardiac giant cells were observed in a microscopic study of 400 biopsy specimens of left auricular appendages removed in the course of mitral commissurotomy and of 30 hearts removed on autopsy from the cadavers of patients who had died of polyarteritis nodosa, lupus erythematosus disseminatus, generalized scleroderma, generalized sarcoidosis, giant cell myocarditis, and chronic rheumatic valvulitis and myocarditis respectively. One type of giant cell was that specific for rheumatic fever, i. e., the major component of Aschoff bodies in the myocardium as well as in areas devoid of muscle. A second type of giant cell appeared to develop from damaged myofibers and was noted in cases of rheumatic fever, giant cell myocarditis, polyarteritis nodosa, and lupus erythematosus. The Aschoff giant cell is derived from the reticuloendothelial system as a specific response to primary connective tissue injury. The myogenic type of giant cell may develop in any area of myofiber degeneration as a limited attempt at regeneration and is a nonspecific response.

BOOK REVIEWS

The Hemorrhagic Disorders: A Clinical and Therapeutic Approach. By Mario Stefanini, M.D., Associate Professor of Medicine, Tufts University School of Medicine, Boston, and William Dameshek, M.D., Professor of Medicine, Tufts University School of Medicine. Cloth. $11.75. Pp. 368, with 147 illustrations. Grune & Stratton, Inc., 381 Fourth Ave., New York 16; 99 Great Russell St., London, W.C.1, England, 1955.

The authors of this book have aimed to meet the needs of the practicing physician in the field of hemorrhagic disorders. They state that in many past treatises on the subject "undue emphasis [was] placed on disorders of the coagulation mechanism, at times to the exclusion of other disturbances of the hemostatic mechanism." In this case, however, the authors have succeeded in presenting all factors involved in the complex mechanisms responsible for abnormal bleeding. They stress the clinical approach and therapy. The aid rendered by the laboratory is not neglected, but it is made clear that, significant as they are, laboratory studies are only one phase of the management of the patient. The first chapter deals with the normal hemostatic process. Classification, vascular defects, thrombocytopenias, coagulation, combined disturbances, anticoagulants, fibrinolysis, obstetric problems, dysproteinemias, treatment, and heredity are covered in the other chapters. The appendix deals adequately with laboratory procedures.

Some of the figures are illustrations and some are charts and graphic presentations of subjects and case histories. In addition, there are 37 tables that summarize the more complex and difficult subjects. All illustrative data are well chosen and extremely helpful. The bibliography includes 753 judiciously selected items. The index is well organized and has ample cross references. The authors are eminently qualified to discuss the material, and the subject is clearly and adequately presented. Abstruse phases have been left out, and the results are most satisfactory. In this respect the monograph is in a class by itself. It can be recommended to practicing physicians and to students of hemorrhagic disorders as one of the best, if not the best, available.

The Luminescence of Biological Systems. Edited by Frank H. Johnson. *Proceedings of Conference on Luminescence* March 28-April 2, 1954, sponsored by Committee on Photobiology of National Academy of Sciences-National Research Council and supported by National Science Foundation. Cloth. $7. Pp. 452, with 161 illustrations. American Association for the Advancement of Science, 1515 Massachusetts Ave., N.W., Washington 5, D. C., 1955.

This volume is a report of a conference that was limited to a small group of the leading investigators in the field of luminescence. The book includes a survey chapter on the prospects and problems of bioluminescence; a number of chapters on the application of recent interpretations of electronic states and transitions to the role of chlorophyll and other photosynthetic pigments in energy transfer; a chapter dealing with the chemiluminescence of 2,3-dihydrophthalazine-1,4-diones; a chapter on the spectroscopic investigations of luminescent systems (chiefly on the firefly and luminescent bacteria), including discussions on purification and properties of luciferase, inhibition and activation of luminescence, and physiological control of luminescence; a single chapter describing the luminous organisms of Japan and the Far East; and two final chapters dealing with the ecology of marine dinoflagellates and "red water" conditions. The volume includes both author and subject indexes.

A History of the Texas Medical Association, 1853-1953. By Pat Ireland Nixon, M.D. Foreword by Merton M. Minter, M.D. Cloth. $6. Pp. 476, with illustrations. University of Texas Press, Austin 12; Thomas Nelson and Sons, Ltd., Parkside works, Edinburgh 9, Scotland; Société française d'éditions Nelson, 25 rue Henri Barbusse, Paris 5e, France, 1953.

In 1853, when the United States was about 70 years old and the state of Texas about 7, the Texas Medical Association was founded by 35 physicians. This proved to be premature; because of the great distances, the danger of attack by Indians, and the difficulty of travel in those days, the association lapsed into inactivity for 16 years. Since then its membership has grown to nearly 6,000. The story of this growth is linked in this book with the growth and development of the state. In the early days of the association, quackery was rife, and a long and vigorous fight against chiropractic and other forms of irregular treatment was waged. More recently just as valiant a fight has been made against socialized medicine. The author has gathered most of his information from the pages of the *Texas State Journal of Medicine* and the earlier proceedings and transactions of the association. All but two of the illustrations are portraits of persons, and most of them were presidents of the association. Most of the index is made up of proper names. Much space in the text is devoted to such material as lists of titles of medical papers read at meetings and lists of names of members and delegates to American Medical Association conventions. Grandiloquent speeches are quoted to give the flavor of the local oratory of the times. The appendix gives the association's constitution and bylaws and an act to regulate the practice of medicine proposed to the state legislature in 1873 and passed in the same year. Although interesting in places to the general reader, this book will be of great interest to only a limited group.

Suprapubic Prostatectomy with Primary Closure of the Bladder by an Original Method: Preparation, Technique, and Post-Operative Treatment. By Univ.-Prof. Dr. Theodor Hryntschak. Authorized translation by Noble S. R. Maluf, M.S., M.D., Ph.D., Chief of Urology, Surgical Service, Veterans Administration Hospital, Houston, Texas. (Completely revised.) Cloth. $8.50. Pp. 187, with 36 illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, 24-25 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, Canada, 1955.

Surgical treatment of prostatic obstruction has been variously modified since the first complete prostatectomy performed by Fuller about 75 years ago. The two methods widely used today, transurethral resection and retropubic prostatectomy, have been developed in the past decade. The operation described by Hryntschak is based on the suprapubic prostatectomy suggested by the Australian urologist, Harris, who advocated closure of the bladder immediately after prostatic enucleation. This method was tried by a number of urologists but was given up because of postoperative hemorrhage and the frequent occurrence of suprapubic fistulas. Hryntschak was impressed by Harris' theories and set out to develop a surgical technique that would obviate the postoperative complications. He succeeded in doing so, largely by compression of the periprostatic blood vessels through carefully adjusted sutures in the prostatic capsule and by perfecting a purse-string suture around the bladder incision, which rendered it watertight. These and other technical measures are carefully described with the aid of excellent illustrations. The first edition of this book was published in German in 1951. The good results achieved by Hryntschak and the absence of postoperative complications in the author's large series of cases testify to the soundness of his technique. There are still many surgeons who adhere to suprapubic prostatectomy who should find much practical information in this book.

Cancer Cells. By E. V. Cowdry, Director, Wernse Cancer Research Laboratory, Washington University, St. Louis. Cloth. $16. Pp. 677, with 137 illustrations. W. B. Saunders Company, 218 W. Washington Sq., Philadelphia 5; 7 Grape St., Shaftesbury Ave., London, W.C.2, England, 1955.

This attractive and useful volume is neither a textbook nor a handbook compendium. Rather, it is an extended and reflective essay about cancer cells, about the possible inciters, inhibitors, and modifiers of cancer cells, and about various cancers as diseases. The first seven chapters are devoted to a review and evaluation of our present knowledge of cancer cells, their cytoplasm, their nuclei, their chemistry, and their response to chemical inciters and modifiers. Although experimental cancer is used to exemplify problems in human cancer, it is used for illumination only and is not extrapolated to the human disease.

These book reviews have been prepared by competent authorities but do not represent the opinions of any medical or other organization unless specifically so stated.

Throughout the book technical terms are clearly defined. The hyperplasias, the metaplasias, invasion and metastasis, polyploidy, and pinocytosis are discussed from the standpoint of their etymology and their meaning in cancer pathology. A chapter is devoted to agents, such as x-rays, radium, and atomic radiation, that may cause cells to become malignant as well as to the known or suspected chemical carcinogens such as beryllium and cigarette smoke. For the physician there are carefully documented chapters on heredity and susceptibility to cancer in human beings and on the geographical frequency of specific types of cancer in man. Of interest to all is the last chapter, which originated in the author's presidential report to the American Association of Cancer Research in 1951, on the present trends in cancer research. This is not the first, nor should it be the last, such appraisal of an area in which vast sums of public and private funds have been made available for research. The general impression left by a careful study of this book is good. When, as in this instance, a careful literate, critical, and curious student surveys and evaluates the available accumulated knowledge of cancer cells and malignant disease, the net result must prove useful and informative. The format of the book is good, and the illustrations are excellent and informative. The bibliography is current, representative, and carefully selected.

Röntgendiagnostik im Kindesalter. Von Dr. Franz Schmid, Privatdozent für Kinderheilkunde an der Universität Heidelberg, und Dr. Gerhard Weber, Professor für pädiatrische Poliklinik an der Universität München. Cloth. 147 marks. Pp. 546, with 604 illustrations. J. F. Bergmann, Trogerstrasse 56, Munich 27; [Springer-Verlag, Reichpietschufer 20, (1) Berlin W. 35 (West-Berlin); Neuenheimer Landstrasse 24, Heidelberg; Göttingen, Germany], 1955.

This is the largest and best illustrated book on the diagnostic use of x-rays in pediatrics that has appeared in the German language; yet the authors modestly term it a brief summary. They have presented a mine of information set forth in an orderly manner and admirably suited for a manual or textbook. The consideration of the various systems is well balanced. The discussion on congenital heart disease is adequate and timely. Angiocardiography, cerebral angiography, bronchography, encephalography, and cardiac catheterization are all given due attention in relation to their application in pediatric examinations. The section on bronchography includes an especially helpful discussion of dosage of the various medicaments involved in relation to the age and weight of the child. The authors do not share the growing opinion that thymic hypertrophy is relatively unimportant. The printing and binding of this volume are excellent; especially good is the reproduction of the roentgenograms, but, as in most European publications, the roentgenograms are reproduced in the diapositive, as prints from the original films. The Europeans contend that there is less loss of detail in such reproductions, a contention that is undoubtedly correct. No physician should have the slightest difficulty in appreciating these illustrations. The bibliography is extensive and contains numerous references to English and American publications. The latter is a commendable exception to the bibliographic compilations of most continental publications. The book is highly recommended to pediatricians, pediatric roentgenologists, and medical libraries.

J. A. M. A. Clinical Abstracts of Diagnosis and Treatment. [Edited by Noah D. Fabricant.] Published with approval of Board of Trustees, American Medical Association. Cloth. $5.50. Pp. 627. Intercontinental Medical Book Corporation with Brune & Stratton, Inc., 381 Fourth Ave., New York 16, 1955.

This book presents in a compact and permanent form a carefully chosen selection of abstracts culled from the Medical Literature Abstracts section that appears in each edition of THE JOURNAL. It thus provides a convenient synopsis of recent developments in the field of medicine. The selection and arrangement is a practical one for the physician since, with the exception of a small section on physiology, the abstracts are restricted to either diagnosis or treatment and are grouped according to medical or surgical specialties. Unfortunately, the index has been similarly arranged. An alphabetically arranged general index would greatly facilitate coverage of topics that may be common to several specialty fields.

A Textbook of Clinical Pathology. Edited by Seward E. Miller, M.D., Medical Director, United States Public Health Service, Washington, D. C. Fifth edition. Cloth. $11. Pp. 1208, with illustrations. Williams & Wilkins Company, Mount Royal and Guilford Aves., Baltimore 2, 1955.

This textbook is designed to give the medical student, intern, resident, clinical pathologist, and teacher of medicine information on how best to use the clinical laboratory in differential diagnosis and in following the course of disease in patients. This new edition is published with extensive revisions and additions. It has 25 chapters as follows: blood techniques (L. W. Diggs); blood cells and bone marrow examinations (L. W. Diggs); anemias, erythrocytoses, hemoglobinurias, and abnormal hemoglobin compounds (L. W. Diggs); laboratory tests in the diagnosis and management of hemorrhagic and thromboembolic diseases (L. W. Diggs); diseases primarily affecting leukocytes (I. Davidsohn); blood groups and significant tests (I. Davidsohn); blood chemistry (C. Cohn and A. Kaplan); hepatic tests (C. Cohn and A. Kaplan); assay of chemotherapeutic and antibiotic agents (A. Milzer); diagnosis of viral and rickettsial disease (A. Milzer); immunologic tests (R. McBurney); medical bacteriology (A. Milzer); medical mycology (E. S. Moss and A. W. McQuown); medical parasitology (S. E. Miller); assay of vitamins (E. von Haam); assay of hormones (E. von Haam); examination of transudates, exudates, skin, and mucous membranes (E. von Haam); diagnosis of venereal lesions (E. von Haam); serologic tests for syphilis (S. E. Miller); cerebrospinal fluid (S. E. Miller); renal function tests and urine examinations (S. E. Miller); saliva, sputum, and bronchial aspirates (S. E. Miller); gastric and duodenal contents (S. E. Miller); seminal fluid (S. E. Miller); and feces (S. E. Miller). The various chapters cover the material pertinent to each, with indications and directions for test procedures and the interpretation of the results. The illustrations are average in quality. This textbook meets adequately the purposes for which it is designed.

Salivary Gland Tumors. By Donald E. Ross, M.D., F.A.C.S., F.I.C.S., Chief Surgeon, Ross-Loos Medical Group, Los Angeles. Cloth. $7.50. Pp. 86, with illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 24-25 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, Canada, 1955.

This is a well-organized treatment of a difficult problem. Various phases of the problem are discussed, from the embryology of the salivary glands to differential diagnosis and treatment of their tumors. There is an extensive bibliography. The discussion of the author's own cases accompanied by photomicrographs is instructive. In a work as comprehensive as this, it is surprising that mumps is not considered in the differential diagnosis and that the postoperative insertion of a filiform bougie into the parotid gland is not mentioned. This book should be helpful to the surgeon faced with a parotid problem, regardless of his experience.

Atlas zur Spurenkunde der Elektrizität. Von Stefan Jellinek, Professor an der Universität und an der technischen Hochschule Wien. Cloth. $17.25. Pp. 78, with 199 illustrations. Springer-Verlag, Mölkerbastei 5, Vienna 1, Austria, 1955.

This book on the physical damage caused by lightning and electrical discharges is distinguished by an extraordinary collection of photographs, many of them in color. The emphasis is on human tissue, and there are some good photomicrographs, but there are also significant pictures of inanimate material. The last seven plates show views of a museum devoted to lightning and electric shock. The author is especially concerned about the question of why any electrical burn is so much more serious than a thermal burn when superficially the two look about equally bad. He finds the explanation in destructive effects on the blood vessel wall; these profoundly impair the circulation and cause more or less extensive gangrene. This book is to be welcomed as a factual contribution in an area where hearsay evidence and superstition have had too much influence. It is attractive in appearance and well indexed. It should interest everyone working in pathology, in industrial surgery, and in legal medicine.

QUERIES AND MINOR NOTES

AIR FILTERS FOR ASTHMATICS

To the Editor:—*I would like information on electric air cleaners and air conditioners for a patient with asthma exacerbated by pollen inhalation. Is there any information regarding their use in persons exposed to pollen all day who would have the advantage of the air cleaner only at night? I also wonder whether an air conditioning unit, which would control the heat and humidity as well as serve as a filter, would be more effective under these circumstances.*

M.D., Wisconsin.

Answer.—The effectiveness of air filters depends largely on the proportion of time that the patient spends in such a filtered atmosphere and in the relative amount of allergy-causing particles that one escapes in such an atmosphere. The amount of pollen that one could avoid in a bedroom during sleeping hours if air filtration were 100% (and it is far from it) would be only a small portion of what the individual would inhale in the daytime. For example, if the 24 hour pollen count were 100, the 8 hour outdoor count at night would be probably around 15 at the most. Of that 15, only about 5 would get indoors without filtration. Thus the problem becomes one of protecting one's self partially against the 5% and ignoring the 95%. Nevertheless, such filtration is frequently effective for the hay fever patient but not however for one who has asthma. The electrostatic type of filter is generally more efficient than the usual window filter, and the latter is more efficient than the majority of air conditioners; however, in spite of the less effective filtration the general comfort from the latter makes it often more desirable.

FRACTURED RIBS

To the Editor:—*What percentage of fractured ribs are demonstrable by x-ray? I believe that many more patients present signs and symptoms clinically of broken ribs than are reported on the initial x-ray.* *M.D., Pennsylvania.*

Answer.—Several factors enter into answering this question properly. If positioning and proper x-ray technique are used, practically all fractures of the osseous portion of the ribs should be demonstrable by x-ray examination. Of course, the cartilaginous portion will not betray evidence of a fracture.

ALBUMIN-GLOBULIN RATIO

To the Editor:—*In a recent set of state board questions, there was the statement "Discuss the A-G Ratio" (albumin-globulin). I take it this has reference to the ratio of albumin and globulin in the blood serum, plasma, or urine in renal disease. Would you discuss this briefly.*

Bruce I. Ryder, M.D., Henry, Ill.

Answer.—The albumin-globulin ratio of the blood is the relation between the number of grams of albumin to the number of grams of globulin per 100 ml. of blood serum. The serum albumin may vary from 3.0 to 4.5 gm. and the total serum globulin from 2.6 to 3.8 gm. per 100 ml. For the urine (mostly of research rather than practical value) it is the ratio of the number of milligrams of albumin per liter to the number of milligrams of globulin. The ratio between the two elements is disturbed when either component alone is distinctly increased or decreased. Thus in kidney diseases with proteinuria, consisting predominantly of albumin (nephrotic syndrome), the albumin fraction of the blood is relatively decreased, so that the albumin-globulin ratio of the serum falls. There is no mathematical relationship between the albumin and globulin in the blood and that appearing in the urine, possibly related to the fact that the smaller molecule of albumin leaks from the kidney more easily than the larger ones of globulin. In the blood in certain severe gastrointestinal disturbances and in idiopathic dysproteinemia, the albumin fraction is relatively low, as well as in severe hepatic dysfunction. In certain reticuloendothelial disturbances such as multiple myeloma and sarcoidosis the globulin fraction may be increased, upsetting the albumin-globulin ratio. In actual practice the term albumin-globulin ratio will probably become of historic interest, as the absolute amounts of albumin and the different types of globulin assume more importance.

CORONARY VASODILATORS IN CORONARY OCCLUSION

To the Editor:—*Please comment on the use of coronary vasodilators, particularly Nitroglycerin and Amylnitrite, in the presence of an acute coronary occlusion with myocardial infarction definitely established by electrocardiogram.*

M.D., Indiana.

Answer.—There has been considerable debate about the use of coronary vasodilators during the acute stage of myocardial infarction. The advocates of such a course argue that the area without blood supply is surrounded by a zone in which the blood supply is diminished by vasoconstriction and that by causing vasodilatation in this zone one might diminish the size of the infarct. The other group argues that since the obstruction is in the main organic, a coronary vasodilator would have no effect on it, and indeed, by reducing the aortic blood pressure and so the head of pressure that profuses the coronary arteries, one would expect that the circulation past the point of narrowing would be reduced, an effect the reverse of that which is desired. Both these viewpoints are reasonable, so that the effect of a vasodilator in a given case of cardiac infarction cannot be safely predicted from theory alone. Experience shows that when coronary vasodilators are given to patients in pain with myocardial infarction, the pain is not relieved in the great majority of instances, and this has led most doctors to believe that these drugs are not of value in this condition. On the other hand there seems to be an occasional case in which pain is relieved. From the practical point of view, one might summarize that there seems to be no objection to trying a vasodilator in a case of acute myocardial infarction. If pain is not relieved one should not persist with medication. If pain is relieved it would seem proper to continue the therapy as long as relief is secured.

ODORIFEROUS URINE

To the Editor:—*An older man's chief complaint at present is the nauseating odor of his urine. A sample of urine was checked and nothing pathologically outstanding was found but the odor, which seems to be a mixture of ammonia gas and other odors. When the patient urinates in quantity the odor sometimes causes him to vomit. He also shows an abnormal dryness of the skin. What would you suggest to eliminate the odor in his urine?*

M. D. Hornedo, M.D., El Paso, Texas.

Answer.—"A nauseating odor of the urine" may be the result of several factors. The most common cause of an ammoniacal odor in an older man is retained urine in the bladder. It would be advisable to catheterize the patient to see whether he has residual urine. It also would be advisable to exclude the possibility of prostatic or urethral obstruction. It is assumed from clinical data given that there is no evidence of pyuria or glycosuria in the course of urinalysis and that it is bacteriologically negative. Any of these factors, if present, may be involved in causing an odor. In some cases, certain types of food, if pre-

---

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any medical or other organization unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

dominant in the diet, will be the cause of a urinary odor. The severe dryness of the skin, which has been noted, may be due to dehydration because of a tendency to avoid drinking much water. It would be well to exclude the possibility of renal insufficiency, which also may be a factor.

TREATMENT OF ADRENAL CORTICAL HYPOFUNCTION (ADDISON'S DISEASE)

To the Editor:—*What is the accepted treatment of adrenal cortical hypofunction (Addison's disease) of recent onset in a 60-year-old patient? Can the disease be properly controlled by the use of salt and meticorten alone? Is treatment with desoxycorticosterone acetate necessary in all cases?*

M.D., Illinois.

Answer.—In a patient 60 years of age one must consider the response of the circulatory system to adrenal hormones. At present one could use cortisone and hydrocortisone (25 mg.) per day for such a patient. The treatment best designed to regulate mineral balance will depend on the heart size, blood pressure, and circulatory status. Assuming the patient has a small heart and relatively low blood pressure for his age, one would give small doses of salt-retaining hormone, 0.1 to 0.2 mg. of fluorohydrocortisone daily, watching carefully for signs of salt or fluid retention and gain in weight. Patients, in general, do better on treatment with small doses of salt-retaining hormone than with salt, alone. In a patient with hypertension, renal insufficiency, or any evidence of myocardial insufficiency, one would not wish to use any appreciable quantities of salt-retaining hormone for regular maintenance. Under these circumstances one could manipulate the electrolytes by dietary means. In most instances supplementary salt or 3 to 5 gm. of sodium chloride (tablet form) per day may be required. In the case of sudden stress or infection the dose of cortisone will have to be increased and provision made for giving added salt-retaining hormone. The circulatory system must be followed carefully in a patient with adrenal cortical hypofunction over 60 years of age if maximal benefit is to be obtained without undue side-effects. In general it is wise to follow the heart size with a 7 ft. film of the chest, electrocardiogram, blood pressure study, and, if necessary, measurement of venous pressure. The up-curve is generally a most useful guide to excess salt and water retention.

LIFE EXPECTANCY OF HYPERTENSIVE PATIENTS

To the Editor:—*Can an essential hypertensive patient in his 40's or 50's who previously had blood pressures of 165/110 mm. Hg but now is held at 140/86 mm. Hg with antihypertensive medication be assured that he is now normal and that he can expect a normal life expectancy so far as the cardiovascular system is concerned?* *M.D., Nebraska.*

Answer.—Medical opinions differ concerning prolongation of life with continuous use of antihypertensive drug or diet therapy. Most authorities are optimistic. Long-range studies of the natural history of hypertension or of results of sympathectomy have yielded varied conclusions according to constitution of study groups and variations of methods of classification of patients. It is now generally accepted that sympathectomy has prolonged life expectancy. There is now no uniform plan of study to test the general belief that adequate continuous therapy prolongs life as it reduces blood pressure and relieves symptoms. The inquiry describes a slight reduction of average blood pressure from a moderate elevation to a level just above normal in a group of patients. This reduction evidently occurs in a group of relatively benign cases of hypertensions. Twenty years of continuous treatment of this group and of observation of a comparable untreated group under carefully controlled and standardized conditions might be required to demonstrate any statistically significant difference. A study group with a higher initial pressure and a more marked reduction might yield results in a shorter time. Definite reduction of blood pressure can lessen severity of the hypertensive disease process and should increase average life expectancy. Nevertheless, reduction would not warrant advice to an individual patient that his life expectancy would be surely increased; also it would not warrant a conclusion that the patient was no longer hypertensive. It would justify reassurance of the patient that his prognosis is probably improved but with caution that he should certainly continue treatment.

INGROWN TOENAIL

To the Editor:—*Is there a successful treatment for ingrown toenail excising the involved margin and treating the base with a chemical substance?*

John C. Stewart, M.D., Riverton, Wyo.

Answer.—The best treatment for ingrown toenail is removal of the margin of the nail and complete removal of the bed. This would mean an incision into the base of the nail and sometimes requires curetting as well as sharp-knife excision. It is conceivable to destroy the bed with a chemical, but it would certainly set up more irritation than would sharp-knife excision.

COLCHICINE AND LIPEMIA

To the Editor:—*A patient brought me a newspaper article in which the use of colchicine was recommended to reduce blood cholesterol level. Is there any merit in such use of this drug?*

M.D., Florida.

Answer.—There is no known evidence that the use of colchicine will reduce the level of the blood cholesterol. The newspaper article probably had reference to observations made that, when colchicine was given at the same time that cream was ingested, the lipemia that normally develops could to a large extent be prevented.

ENDOMETRIOSIS

To the Editor:—*A 29-year-old patient had a bilateral salpingo-oophorectomy and super vaginal hysterectomy because of a hopeless endometriosis of both ovaries. The surgeon informs her that she is never to allow anyone to give her any estrogenic material. Has it been shown that estrogen is harmful in a condition of this sort? The patient is already showing subjective and objective results of estrogen deficiency.*

Fred L. Ewing, M.D., Meadville, Pa.

Answer.—In spite of the common belief that estrogens are contraindicated in women who have had both ovaries removed for endometriosis, it has been shown that small doses of estrogen may safely be given for the relief of menopausal symptoms in these women. In fact, a few gynecologists are prescribing large doses of estrogen to diminish the size of endometriotic masses and relieve the pain of endometriosis.

ERUCTATION OF HYDROGEN SULFIDE

To the Editor:—*Regarding the question and answer on page 1575 of* The Journal, *Aug. 27, 1955, on eructation of hydrogen sulfide, I believe that the consultant overlooked one cause of "fecal odor" of the breath, namely, gastrocolic fistula. I have found several cases at autopsy.*

John H. Schaefer, M.D.
525 S. Flower
Los Angeles 17.

To the Editor:—*In* The Journal, *Aug. 27, page 1575, under Queries and Minor Notes, there was a reference to the eructation of hydrogen sulfide. In the brief discussion given, no comment was made of the uncommon but important possibility of a gastrocolic or duodenocolic fistula producing all the symptoms that the patient presented. Certainly, further gastrointestinal x-ray examinations should be done.*

OCCUPATIONAL HEALTH PROBLEMS IN AN INDUSTRIAL SOCIETY

Stafford L. Warren, M.D., Los Angeles

When the medical student of today begins to think about his future professional career, he is often confused by the multiplicity of choices for his life work. Until recently, little or no importance has been given to a relatively new, very broad, and challenging field. It is my purpose to explore, and to some extent define, the present developments in a new specialty and perhaps a new era in public health in a field called occupational health. Industrial medicine has grown up empirically to serve a need. Industry had first to provide medical care for its workers who received traumatic injuries on the job. This expanded subsequently into the screening of employees both before hiring and during employment to explore their physical fitness and to provide for their proper placement. During the earlier period accident and compensation insurance developed as a means of financing the treatment and care of those injured during and as a result of employment. During the last two decades a considerable labor market has been found for persons whose capacity for work is limited, by one or another handicap or partial disability, to certain types of activity or occupation. The proper choice and evaluation of the type of work and the labor capacity of the individual is a difficult and complex medical problem and has given rise to extensive testing programs that the doctor must carry out or participate in. Recently, and mainly as a result of the demonstrations of new techniques utilized by the armed forces and veterans' facilities hospitals, the rehabilitation of potential workers has become a part of the over-all armamentarium of the industrial doctor and his associates.

While all of this has been developing in the industrial physician's orbit and practice, he often has had relatively little contact with or little interest in what actually goes on in the plant, and he is not often brought into the planning stages of new ventures by management. Recent experiences by both management and doctors have shown that this is wasteful and that a great deal can be gained by breaking down the barriers and promoting free communication among the three-party group of management, labor, and the doctor in these areas. The industrial physician then may be said to practice medicine in industry. He must be aware of the special problems of management as well as the peculiar hazards to which the worker is exposed, their prevention, and treatment of the injuries that they may produce. He has many other responsibilities too. This is a broad and fascinating field of practice of great importance to efficient management of industry.

NEW ROLE OF PUBLIC HEALTH PHYSICIAN

There is another type of practice that requires a little different type of training and utilizes more of the public health and preventive medicine techniques while dealing with the effects of hazardous substances. This field might be called occupational health. In the past, the doctor in a public health practice has had to deal mainly with large numbers of the population ill with some epidemic and infectious disease. With some oversimplification one may say that, in his civic role, he has assembled the most recent information on the identification, treatment, and modes of spread of the several epidemic diseases and has informed the medical profession and the public as to what is the best way of combating or preventing these diseases. As a result of this team play, we have safe, potable water and milk and efficient and safe sewage disposal systems; we have had vaccination programs and screening surveys. Many diseases have been eliminated as a serious threat by these and other techniques familiar to all. During and since the war we have had an era of development of the biological attack on disease, i. e., the penicillins, the "mycins" and "cidins," and the specific chemical substances like the sulfonamides, the antimalarial agents, and many others. As a result, we are beginning to see a change in the type of medical practice and likewise in the type of patient in the office, clinic, and hospital. No longer do we have a high mortality from pneumonia and meningitis. The mastoid sinus operation is rarely done nowadays. The "frozen pelvis" and urethral stricture and the gummas of the recent past are rarities, even though the venereal disease problem is still with us. Even the "great white plague" and probably poliomyelitis seem to be on the run. This does not mean that the public health physician will need to be dispensed with. His methods and his police power must be kept intact to safeguard people on every hand.

dedicated workers—an engineer and gadgeteer, a physicist, an electron microscopist, a biochemist, a pathologist, and others.

This is a frustrating type of research unless it has the rest of the approach to go with it. A new industrial process uses a new compound or substance with a known chemical formula. A few rather extensive experiments are done by intramuscular and intravenous injection and by feeding experiments to determine the basic toxicity and the site of damage and the symptoms of dysfunction. Then, using a relatively small number of animals in each group, a 10-day trial is made over a wide range of dosage, with feeding and inhalation exposure. Large enough concentrations are used to obtain some lethal effects. After these animals are killed and examined, the dosage is scaled down and a 30-day run is made, the levels being set to achieve some lethal effect. These animals are then killed and studied. About six months has elapsed, and a great deal is now known about the material. The long-term (approximately one year) minimal concentration levels are now tried with the range set to show just an effect with some of the animals and to show no demonstrable difference from the controls with other animals. At the end of the program the animals are killed and examined as before. If the design was good and the expected survivals occurred as in the controls, the results are comparable to similar experimental runs in the same species with other materials. For all this trouble and expense, one has only a few points on a curve. Yet, they are of relative value within the species, and, when the art progresses sufficiently, we may have a ratio to extrapolate with some accuracy from animal to man. At present there is considerable discussion as to the validity of this extrapolation, and often, in setting the value for man, a factor of safety is incorporated. The value for the animal is frequently reduced by a factor of 10. The "no exposure" policy developed for radiation hazard by the University of Chicago metallurgic laboratory group under Robert Stone during the Manhattan District era is one that we should all like to see applied, but it is unlikely that such an ideal will be reached in most industries.

It may be said that the experimenters get little return for their long effort unless they are permitted to explore the interesting side-effects that may be found during these routine daily chores. There must be enough of these excursions provided in the budget to keep good men in the field. Otherwise such work will not be done. Aside from the great cost of these long experiments, the routine character of the experiment has not attracted scientists into this field, and thus, not much of this type of work has been done. Liquids and gases are special problems, and, while they are easier to use in the chamber, they are often difficult to standardize biologically in other ways.

OCCUPATIONAL HEALTH PROBLEMS IN METROPOLITAN CENTERS

There is another aspect of occupational health that must be considered here. Up to now we have been concerned with the workman in industry, and the exposure has been that of the eight-hour day. Most of our large industrial areas are developed in and around a large metropolitan center. Many of these cities have a meteorologic situation conducive during part of the year to the production of what has recently been termed as "smog." This is a combination of fog and other things presumably arising from smoke, industrial effluents, engine exhausts, and other sources. This mixture is formed under an inversion layer at a time when there is little or no wind and turbulence. Visible moisture or fog may not be evident. That this may be hazardous to populations has been demonstrated by reported episodes in London, England, and Donora, Pa., and elsewhere. Communities have become aware of their potential danger and have set up control facilities and policing agencies in the attempt to eliminate this hazard. Some of the toxic elements have been identified (sulfur dioxide, carbon monoxide); others are presumably hazardous (hydrocarbons plus oxides of nitrogen in bright sunlight may form toxic amounts of ozone). Many others are unidentified. The situation probably varies greatly from city to city and from time to time throughout the year.

Reliable standards for safe levels and dangerous levels, which might be applicable for safeguarding the population under such conditions, do not exist for even the known toxic materials. Although published tables give safe concentrations of some of these materials, most values are not backed by more than by what might be termed empirical assumptions. Furthermore, values given as safe for an eight-hour exposure are not necessarily applicable for longer periods. The population is not made up of "normal workers" but has a variety of ages and people in varying conditions of health. Another disturbing feature of the "smog" problem is that the material is not confined to the contents of a building as it is in industry but may be slowly drifting about in a large mass at near ground level and may be anywhere at a given time. This makes detection, measurement, and public safety a difficult situation. Prevention is, of course, the key to the situation, but what may be safe during a windy day may not be safe during a "smog" cycle. To close up all sources of air pollution is at present an impossibility, particularly since the known sources are so numerous and so widespread. It would appear that a great deal of biological experimental work in setting safe standards will be required on the known elements and other hazardous elements of "smog" as soon as they are identified.

Many communities do not have the proper legal machinery to deal simply with the evacuation problem if it would become necessary to remove people from a dangerous situation. Most of our public health laws pertain to procedures for preventing people from leaving areas (quarantine). Most local and state disaster acts have the mechanisms required to evacuate homes and feed people and pay for these costs, but in some jurisdictions the procedure is awkward and needs clarification.

Radioactive Contamination.—While radioactive contamination has been a part of the deliberations of another section of this 15th Annual Congress on Industrial Health, for the sake of completeness one must mention safeguarding the public from the radioactive materials that are used in hospitals and industry. The amount used has gradually increased to the point where they are no longer a negligible factor in our sewage and therefore have a potential hazard to our food and water supply. The great concentrating power of the roots of plants must not be overlooked. Thus, what may be considered a safe, low-level radioactive contamination with long-life material may be an insidious hazard if it becomes available to the plant and thus our food cycle. Adequate controls and their enforcement may eliminate this hazard except in the case of an atomic war. In such an eventuality, the over-all, long-time, insidious hazard to large numbers of our population could readily reach fantastic proportions. Many of the problems that atomic warfare would create are capable of solution by adaptation of the same sound principles of good public health practice that have been used to safeguard the public against the spread of disease. However, some special procedures will have to be devised for safeguarding our people. While many seem complex and impractical now, if they are required for survival, we will learn to use them. The race has always done whatever was necessary for survival. It may mean a return to a very primitive existence for a period. The cost of avoiding contamination in everyday living might require all of our energy and time available beyond that required for basic food and shelter.

Eliminating Hazards.—In order to function effectively, the physician in occupational health has to be familiar with the problems of the industrialist—why he does things a certain way, what things affect his costs. Most industrial procedures are composed of a series of simple steps multiplied many times. The elimination of hazards must be developed in the same way, through simple steps multiplied many times, if possible, without delaying or otherwise increasing the cost of the operation. The workman must understand the reasons for complying with the safeguards. This is an educational procedure and also a problem in communication. It often starts with management passing down the information through the foreman and the steward to the workman. The union has to be convinced. Great patience and tact are required. Some knowledge of engineering and a sense of humor are of great value to the physician.

NEED FOR MORE MEDICAL SCIENTISTS

From a review of the problems confronting the doctor in the occupational health field, it would appear that there is a great deal to be done in the way of mutual education and spread of technical knowledge among the agricultural, meteorologic, medical, engineering, biophysical, chemical, industrial labor, and management groups. There is almost a new frontier here daily in considering safe practices and safe levels of exposure for new developments. From the medical-biological standpoint, even though there are many familiar elements, a very different approach is required than what is currently called industrial medicine. While there are a few medical and other scientists interested in this field, the magnitude of the problems confronting them are so great that every effort should be made to train more men in this field. There has been and still is a great scarcity of research in solving serious basic problems confronting both industry and the community. Such research is urgently needed and should be done on an appropriate scale to achieve the necessary data within a reasonable time. There are essentially five areas in the United States that have acute industrial and community problems (smog) peculiar to themselves. These are the metropolitan areas of (1) New York City and New Jersey, (2) Pittsburgh, (3) Detroit and Chicago, (4) Los Angeles, and (5) San Francisco and Seattle. In each of these locations there should be built and subsidized a university-connected research laboratory. Training of personnel should be a salient feature of this program. Each should be the focal point for its area. While state and local support should play some part, the product data and trained personnel from these laboratories are useful to the nation as a whole and thus might be subsidized by a federal grant-in-aid procedure. They should be integrated with a university program so that training and consultation from other experts may be available. Agriculture must not be overlooked, both because of the rapid development of pesticides and weed killers for large-scale use and because many vegetables and plants are equally sensitive to industrial and other air pollutants.

It is my belief that the subject is both broad and important enough to warrant setting up a joint commission at the national level to consider both technical problems and social consequences. Such a commission, made up of representatives of labor, management, government, and the affected professional groups, could define the basic problem, determine areas of needed study and investigation, and ultimately assign responsibility for continuing supervision and implementation. I hope real consideration will be given to the best ways to proceed in order to reach common understanding and mutual helpfulness. And, to the adventurous medical student who would like to deal with mass problems rather than those of the individual, and who perhaps has some mechanical bent, the broad field of occupational health should offer a great challenge in our industrial age.

Hormonal Treatment of Allergy.—Cortisone and hydrocortisone are useful therapeutic agents in selected cases of allergic and related disorders. . . . These steroids possess potentially dangerous side effects. . . . Long-term maintenance therapy has proved more dangerous than short-term treatment. It has become fashionable to condemn the use of cortisone and hydrocortisone, but it may be necessary to employ these steroids if other therapy proves unavailing. . . . Each patient with severe allergic and related disease [should] be studied with care before being placed upon corticosteroid therapy. Such treatment is often far easier to initiate than to terminate. If cortisone and hydrocortisone are to be used, the patient should also be taken into the physician's confidence and should be made aware of the drawbacks as well as the advantages of steroid therapy. If long-term maintenance therapy is necessary, the doctor and patient must cooperate throughout treatment. The patient should be seen at frequent intervals and examined thoroughly. He must likewise be instructed to report all deviations from normal. . . . All possible means of protecting the patient from undesirable side effects must be explored. The steroid chemists are searching for effective and safer compounds. New compounds are rapidly becoming available, but only time and careful clinical evaluation of each will determine its true worth. . . . The search for the modes of action of these adrenocortical steroids must be continued and encouraged. Success in this field of investigation may ultimately lead to safer use of these agents, and perhaps will even bring about a better understanding of allergic and related diseases.—W. S. Burrage, M.D., and others, The Use of Cortisone and Hydrocortisone in Allergy, *Annals of Internal Medicine*, November, 1955.

INFLUENCE OF ANESTHESIA ON INFANT MORTALITY RATE IN CESAREAN SECTIONS

Peere C. Lund, M.D., Johnstown, Pa.

It is generally agreed that the choice of anesthesia in cesarean sections is of particular importance because there are at least two lives to be considered, and unfortunately the anesthetic that appears ideal for the mother may actually be unsatisfactory or even dangerous for the fetus. The numerous articles in the current medical literature dealing with this subject indicate that there is a wide divergence of opinion regarding the choice of anesthesia for this procedure.[1] I believe that many of the positive opinions expressed are based on the maternal mortality and morbidity rates without a thorough consideration of the effect upon the fetus. A review of the current literature dealing with infant mortality rates in cesarean sections likewise reveals a marked discrepancy.[2] This is in a large measure due to the use of variable standards. Some authors, for example, when expressing fetal mortality rates consider only term infants (weighing 2,500 gm. and over), while others consider only infants weighing over 1,000 gm. The rather common use of the "estimated period of gestation" also causes confusion and never can be considered accurate. In this series the standard used is fetal weight, and any infant who did not leave the hospital alive, regardless of how long after delivery, was considered a mortality.

There are numerous factors that may contribute to fetal mortality in cesarean section.[3] The commonest perinatal causes of infant mortality are: (1) anoxia due to such factors as placenta previa or abruptio, prolapse of the cord, or prolonged labor; (2) prematurity; (3) malformations; (4) erythroblastosis fetalis; (5) trauma or infections during delivery; (6) abnormal pulmonary function usually due to hyaline membrane disease or intra-alveolar hemorrhage; (7) various other conditions such as maternal diabetes, syphilis, or toxemia; (8) anesthetic agents, directly due to central depressant action on the fetus or secondarily due to maternal hypotension; and (9) various unknown maternal or fetal causes. The prime factor in most instances, however, is the maternal complication for which the operation is performed. Second in significance is the period of gestation or the weight of the fetus. The immediate management and resuscitation of the infant after delivery also plays a vital role in survival rates. To estimate accurately the role played by anesthesia all other factors that influence infant mortality rates must be eliminated or excluded. Similarly to estimate the relative influence of various types of anesthesia upon infant mortality rates similar conditions must prevail. Obstetricians frequently refer to a rather vague term the "intrinsic fetal mortality rate in cesarean sections."[4] I believe from this study that a large percentage of this so-called intrinsic mortality rate is actually due to the effects of anesthesia, the notable exception in some cases being death due to intracranial hemorrhage.

The premedication is varied with the type of anesthesia employed and the condition of the fetus. In uncomplicated cases before conduction anesthesia, secobarbital (Seconal), 1.5 grains (0.1 gm.), is administered two hours preoperatively and meperidine (Demerol) hydrochloride, 50 to 100 mg., with scopolamine, 1/150 to 1/200 grain (0.4 to 0.3 mg.), one hour preoperatively; before balanced anesthesia or administration of cyclopropane alone, scopolamine, 1/150 grain (0.4 mg.), is given one hour preoperatively. In cases in which fetal anoxia is known to be present only scopolamine is given.

TYPES OF ANESTHESIA

All the cesarean sections in this series were performed with one of the following three types of anesthesia: lumbar analgesia (spinal anesthesia), balanced anesthesia, or epidural anesthesia. Similar techniques were used in each instance to keep the number of variable factors at a minimum.

Lumbar Analgesia.—Hypobaric tetracaine (Pontocaine) hydrochloride solution, 0.1%, was utilized in each instance. The patient is placed on her side without a pillow. The operating table is inclined so that the patient's head is just below the horizontal. From 9 to 11 cc. of the solution is injected slowly. No solution is injected during labor pains. At the completion of the injection the patient is quickly turned on her back and the table placed in a slight Trendelenburg position. The onset of anesthesia is rapid (4 to 5 minutes) and extends over a 60 to 90 minute period. Following delivery small amounts of thiamylal (Surital) sodium are administered if somnolence is desirable. Lumbar analgesia was employed in 423 cases in this series.

Epidural Anesthesia.—Epidural anesthesia was induced with 20 to 25 cc. of 2% hexylcaine (Cyclaine) hydrochloride or lidocaine (Xylocaine) hydrochloride solution. The patient is placed in the lateral position with a pillow under her head on an operating table in a slightly reversed Trendelenburg position. The epidural needle is introduced in the lower lumbar region and advanced until it impinges on the ligamentum flavum. The

stilet is then removed, and a 5 cc. syringe previously filled with distilled water is connected to the needle. The epidural needle is then advanced slowly with the left hand while firm pressure is applied to the plunger of the syringe with the right hand. The sudden advance of the plunger of the syringe indicates that the needle has entered the epidural space. The sudden complaint by the patient of a burning pain, caused by the distilled water, is further evidence that the epidural space has been entered. Five cubic centimeters of the desired anesthetic solution is then rapidly administered to stop the burning pain. After careful aspiration in all planes to make certain that the needle has not punctured the dura an additional 15 to 20 cc. of the anesthetic solution is slowly injected. The patient is then turned on her back, but the table remains in the reverse Trendelenburg position 5 to 10 minutes before being positioned according to the desires of the obstetrician. Following delivery small amounts of thiamylal sodium are administered if somnolence is desired. Epidural anesthesia was employed in 45 cases in this series.

* Balanced anesthesia used was induced with cyclopropane and thiamylal (Surital) sodium.

Balanced Anesthesia.—When all is in readiness for the abdominal skin preparation anesthesia is induced with 5 cc. (100 mg.) of thiamylal sodium and cyclopropane is then administered by the closed circle absorption technique. Sufficient anesthesia is given to prevent muscular movement until after delivery of the baby. When an endotracheal tube is passed, 20 to 30 mg. of succinylcholine chloride is utilized to induce maximum relaxation. In these cases controlled respirations are required to rapidly attain a sufficient depth of anesthesia for surgery. The skin incision is made as soon as possible after the induction with thiamylal sodium, and the baby is rapidly extracted. This method of anesthesia was employed in 203 cases.

RESULTS OF STUDY

The 671 cesarean sections resulted in the delivery of 676 infants, including one set of triplets and three pair of twins. There were 68 fetal deaths in 63 cesarean sections, which is a gross fetal mortality rate of 10% occurring in 9.4% of the sections. The corrected fetal mortality rate that was obtained by eliminating the stillbirths and the severe congenital deformities was 5.6%. One maternal death occurred in this series, but the baby survived. A 26-year-old multipara while undergoing a repeat cesarean section developed cardiac arrest secondary to a pulmonary embolism and died approximately six hours postoperatively of cerebral anoxia. The gross mortality rate in this series appears rather high; however, a more accurate picture is reflected by the corrected figure. Table 1 lists the indications and types of anesthesia used for the cesarean sections.

Causes of Fetal Mortality.—Table 2 summarizes the gross causes of fetal mortality in this series. This series was divided into two groups depending on the presence or absence of known maternal complications that might affect fetal mortality. The advent of labor or the presence of prematurity per se were not considered as factors in this division because the relative survival of the premature infant was considered to be significant.

* Excluding stillbirths and congenital deformities.

Uncomplicated Cesarean Sections.—There were 450 cesarean sections performed in which there were no known maternal complications that might cause fetal mortality. Indications for surgery and number of cases were: cephalopelvic disproportion, 193 (113 with lumbar analgesia, 68 with balanced anesthesia, and 12 with epidural); previous cesarean section, 215 (139 with lumbar analgesia, 54 with balanced anesthesia, and 22 with epidural); elderly primipara, 27 (16 with lumbar analgesia, 9 with balanced anesthesia, and 2 with epidural); and vaginal plastic repair, 15 (12 with lumbar analgesia, one with balanced anesthesia, and 2 with epidural). Thus, of the total 450 cesarean sections performed, 280 were done with lumbar analgesia, 132 with balanced anesthesia, and 38 with epidural. A statistical analysis of the fetal deaths that occurred in these cases shows that the indications for cesarean sections and the type of anesthesia employed in the cases in which perinatal mortality occurred are: cephalopelvic disproportion, six (four with lumbar analgesia and two with balanced anesthesia); previous cesarean section, seven (five with lumbar analgesia and two with balanced anesthesia); and elderly primipara, one (with balanced anesthesia). In this group there were 14 fetal deaths, with 9 occurring following lumbar analgesia and 5 after balanced anesthesia. This results in a gross fetal mortality rate of 3.1% (3.2% with lumbar analgesia, 3.8% with balanced anesthesia, and none with epidural anesthesia). The over-all corrected mortality rate, excluding stillbirths and severe congenital deformities, is 1.8% (1.8% with lumbar analgesia, 2.3% with balanced anesthesia, and none with epidural anesthesia). Thus the corrected mortality rate with conduction anesthesia is only 1.6%.

The cause and number of cases of neonatal death in uncomplicated cesarean sections in which lumbar analgesia was used were: stillbirth, one; hydrocephalus, two; erythroblastosis, one (in an infant who lived three days); prematurity, three; congenital heart disease, one; and atelectasis, one. The weight and life span of each of the three premature infants were: (1) 1,167 gm. (2 lb. 9 oz.) and lived five hours; (2) 1,667 gm. (3 lb. 10 oz.) and lived six hours; and (3) 2,196 gm. (4 lb. 13 oz.) and lived one day before dying of an intraventricular hemorrhage. In this group there were two term infants, one weighing 3,345 gm. (7 lb. 6 oz.) who lived four days before dying of an intraventricular hemorrhage and congenital heart disease. The other infant, who weighed 3,770 gm. (8 lb. 5 oz.), was subjected to a 28 hour labor before cesarean section was performed. Respirations in this infant were depressed, and slight cyanosis was present when the infant was delivered. Much thick, tenacious secretion was aspirated from the oropharynx and trachea. This infant never achieved a satisfactory respiratory exchange and died on the second day of hyaline membrane disease with atelectasis. Anesthesia appeared to play a role in the death of one of the premature infants and the term baby who died of atelectasis but played no role in the causation of the stillbirth.

The cause and number of cases of perinatal mortality in uncomplicated cesarean sections in which balanced anesthesia was used were: stillbirth, one; congenital deformities, one; prematurity, two; and atelectasis, one. The weight and life span of the two infants were: (1) 1,775 gm. (4 lb.) and lived 15 hours, during which time respirations were delayed and good color developed following resuscitation, but death occurred without satisfactory respiratory activity having been established; and (2) 2,308 gm. (5 lb. 1 oz.) and lived 5 hours, during which time marked depression of respirations and cyanosis was present after delivery, adequate respiratory exchange was not established, and death finally occurred due to atelectasis. A full-term infant weighing 2,665 gm. (5 lb. 14 oz.) died on the fifth day from bronchopneumonia and atelectasis. Respiratory activity was depressed, and slight cyanosis was present after delivery that responded quickly to resuscitation. Anesthesia may well have played a role in the death of the above premature and full-term infants. The stillborn infant in this group weighed 1,942 gm. (4 lb. 10 oz.). Cesarean section was indicated because the mother was 41 years old. Labor had been present approximately four hours, and the membranes were ruptured. There was no apparent cause for the stillbirth, and thus anesthesia may well have played a role in this death.

Complicated Cesarean Sections.—Table 3 summarizes the 221 cesarean sections in which there were known maternal complications that might affect fetal mortality.

Complicated Cesarean Sections with Fetal Mortality: Table 4 summarizes the fetal mortality that occurred in the 221 complicated cesarean sections in this series. A set of triplets and two pair of twins are included in this group. The causes and number of cases of perinatal mortality in complicated cesarean sections in patients anesthetized with lumbar analgesia were: stillbirth, 10; prematurity with or without other factors, 15; diabetes, one; and atelectasis, one. Analysis of the cause of death of the 15 premature infants shows that death was thought to be due to prematurity in the 6 infants who weighed under 1,500 gm. (3 lb. 5 oz.). Of the remaining nine infants, one weighed 1,531 gm. (3 lb. 6 oz.), lived three days after cesarean section due to face presentation and uterine inertia in the mother, and died due to prematurity and hemorrhage from the gastrointestinal tract; one weighed 1,601 gm. (3 lb. 12 oz.), lived eight hours, showed depressed respiratory exchange with slight cyanosis that was present at birth, lacked good color despite the fact that there was apparently adequate tidal exchange, and died due to cerebral anoxia secondary to intra-alveolar amniotic fluid that had been aspirated before delivery, as determined at autopsy; one weighed 1,658 gm. (3 lb. 14 oz.), lived four days, was delivered by cesarean section because of eclampsia and placenta previa, and showed marked respiratory depression and mild cyanosis on delivery, which improved rapidly following resuscitation; and one weighed 1,658 gm. (3 lb. 14 oz.), lived eight hours, showed depression of respiratory activity and cyanosis on delivery, had much mucus

* Including 1 set of triplets and 3 pair of twins.

that was aspirated from the trachea and oropharynx, and showed a quick improvement in color but the respirations remained shallow. The other five weighed 1,573 gm. (3 lb. 11 oz.), 1,658 gm. (3 lb. 14 oz.), 1,875 gm. (4 lb. 2 oz.), 1,956 gm. (4 lb. 5 oz.), and 2,013 gm. (4 lb. 7 oz.). Each of these five infants was delivered by cesarean section because of the presence of placenta previa, and each lived less than 12 hours. Anesthesia cannot be excluded as a contributory factor in the deaths in the last six cases but certainly played no part in the first three cases. There were two full-term infants in this group. The first weighed 3,118 gm. (6 lb. 14 oz.) but lived only five hours. The mother was a diabetic, and, since no other cause was found, death was considered as due to diabetes. The second infant weighed 3,090 gm. (6 lb. 13 oz.) and lived 24 hours. Section was performed because of placenta previa. Respiratory activity was weak upon delivery, but the color was good and a large amount of secretion was aspirated from the air passages. Cyanosis occurred several hours after the infant was placed in an incubator. Anesthesia cannot be excluded as a contributory factor in the second case but we believe that resuscitation may have been inadequate. Anesthesia played no role in the death of the first infant.

The causes of the stillbirths in this group are eclampsia or severe preeclampsia present in six cases and placenta abruptio necessitating cesarean sections in the other four. No heart sounds were heard preoperatively in any of the above. Anesthesia was not a contributory factor in any of these.

The cause and number of cases of perinatal mortality in complicated cases of cesarean sections in patients anesthetized with epidural anesthesia were stillbirth, two; and prematurity, one. The premature infant weighed 1,985 gm. (4 lb. 4 oz.) and died on the second day of atelectasis secondary to hyaline membrane disease. Section was performed because of hypertension and chronic pyelonephritis. The two stillbirths were due to complete placenta abruptio; in neither case were fetal heart sounds heard preoperatively. Thus anesthesia was not a contributory factor to the death of any of the infants in this group.

The causes and number of cases of perinatal mortality in complicated cesarean sections in which balanced anesthesia was used were stillbirth, 14; congenital deformities, one; and prematurity, 9. The weight and life span of the premature infants and the indication for cesarean section were: one weighed 1,531 gm. (3 lb. 6 oz.), lived 7 hours, showed delayed and depressed respiratory activity, never achieved adequate pulmonary ventilation, and was delivered by cesarean section because of placenta previa; one weighed 1,956 gm. (4 lb. 5 oz.), lived one day, had cyanosis on delivery secondary to depressed respiratory activity, had a poor cry, and was delivered by cesarean section because of placenta previa; one weighed 2,126 gm. (4 lb. 11 oz.), lived two days, had a long delay in obtaining adequate respiratory exchange, had cyanosis, had poor cry, and was delivered by cesarean section because of uterine inertia and mild preeclampsia; one weighed 1,956 gm. (4 lb. 5 oz.), lived 14 hours, had cyanosis and depressed respiratory activity, had weak cry, and was delivered by cesarean section because of placenta previa; three sets of triplets, each weighing 907 gm. (2 lb.) and living less than 3 hours, were delivered by cesarean section because of placenta previa; and one set of twins, each weighing 1,134 gm. (2 lb. 8 oz.) and living 3 hours, and one set of twins, each weighing 936 gm. (2 lb. 1 oz.) and living 7 hours, were delivered by cesarean section because of placenta previa. The triplets and twins died because of gross immaturity. In the other four infants, however, anesthesia cannot be ruled out as a contributory factor.

The causes of the 14 stillbirths in 13 complicated cesarean sections in patients anesthetized with balanced anesthesia were: one followed a transverse presentation with prolapse of the cord and absence of fetal heart sounds preoperatively; 10 (9 sections) were due to complete placenta abruptio, in none of which fetal heart sounds were present preoperatively; and in two cases, however, following placenta previa fetal heart sounds were heard preoperatively. In only the remaining two cases could anesthesia be considered as a possible contributory factor in the infant mortality.

Gross Fetal Mortality Rate, by Weight.—Table 5 summarizes the gross perinatal mortality by weight of

TABLE 5.—*Fetal Mortality Rate, by Weight and Type of Anesthesia*

Weight	Total No. Infants	Anesthesia						Difference, %
		Conduction			Balanced			
		No.	Died	%	No.	Died	%	
Gross Rate								
Under 1,000 gm. (under 2 lb. 3 oz.)	6	3	3	100	3	3	100	0
1,000-1,500 gm. (2 lb. 3 oz.-3 lb. 5 oz.)	9	6	5	83	3	3	100	17
1,500-2,000 gm. (3 lb. 5 oz.-4 lb. 6 oz.)	34	24	13	54	10	8	80	26
2,000-2,500 gm. (4 lb. 6 oz.-5 lb. 8 oz.)	47	28	3	10.7	19	7	36.8	26.1
Over 2,500 gm. (over 5 lb. 8 oz.)	580	408	15	3.7	172	8	4.7	1
Total	676	469	39	8.3	207	29	14	5.7

1,500-2,000 gm. (3 lb. 5 oz.-4 lb. 6 oz.)	27	21	10	47.6	6	4	66.6	17
2,000-2,500 gm. (4 lb. 6 oz.-5 lb. 8 oz.)	40	27	2	7.4	13	1	7.7	0.3
Over 2,500 gm. (over 5 lb. 8 oz.)	568	399	6	1.5	169	5	3	1.5
Total	646	454	24	5.3	192	14	7.3	2

the 676 infants delivered in this series. This table indicates that anesthesia has a marked influence on the gross fetal mortality rate of premature infants delivered by cesarean section but little influence on that of the full-term infants.

Corrected Fetal Mortality Rate, by Weight.—Table 5 also summarizes the corrected fetal mortality rate obtained by eliminating the stillborn infants and those infants born with severe congenital deformities. None of the infants weighing less than 1,000 gm. (2 lb. 3 oz.) survived, regardless of the type of anesthesia utilized. This table indicates that anesthesia also has a statistically significant influence on the corrected fetal mortality rate (by weight), particularly in the 1,000 to 2,000 gm. (2 lb. 3 oz. to 4 lb. 6 oz.) weight group. The infants in this series have all been delivered by cesarean section under similar conditions and circumstances. This being the case it is believed that the difference in the corrected fetal mortality rates obtained under conduction and balanced anesthesia is due to the influence of anesthesia.

Infant Resuscitation.—The responsibility for resuscitation in these cases belongs to the anesthesiologist.[5] The actual resuscitative procedures required in a particular case depend of course on the condition of the infant at the time of delivery. In each instance, however, it is imperative that the following principles be applied: (1) immediate aspiration of all secretions in the air passages, (2) maintenance of body temperature, (3) gentle and minimum handling, and (4) administration of oxygen in such a manner that it can be utilized. In addition the stomach contents should be aspirated.

Stage of Depression: Infants born in a stage of depression generally require only tracheal aspiration, insertion of an oropharyngeal airway, and oxygen administration by intermittent positive pressure until spontaneous respiratory activity has been established.

Stage of Spasticity: Infants born in a stage of spasticity are treated as above, but in addition an endotracheal tube is left in position following aspiration of the trachea and oxygen is administered by intermittent positive pressure through this tube until spontaneous respirations have been initiated.

Stage of Flaccidity: Infants born in a stage of flaccidity are treated in the same manner as the second stage, but an effort should be made to aspirate the main bronchi as well as the trachea. An infant bronchoscope, 3 or 3.5 mm., is a valuable adjunct for this procedure. The administration of oxygen by intermittent positive pressure following adequate aspiration of the tracheobronchial tree maintains oxygenation of the infant's blood until spontaneous respiration fully expands the lungs. The Hering-Breuer reflex is also incited by this procedure. The Shaefer and Sylvester methods of artificial respiration are of no value in asphyxia of the newborn infant because of the absence of negative intrapleural pressure in infants who have never breathed. I agree with Eastman that oxygen–carbon dioxide mixtures should not be used in infant resuscitation and as a general rule stimulation with drugs should be avoided.[5] The various drugs that have been used to stimulate infants are undesirable because their action is unreliable, some causing an excitement stage or a convulsion and all followed by a period of depression.

COMMENT

Premedication is as important in cesarean sections as it is in other surgical procedures. The dose of the medicaments used is kept at a minimum, but an attempt is made to allay maternal apprehension while inducing a minimum of fetal respiratory depression.

Methods of Anesthesia.—The three methods of anesthesia used were lumbar analgesia, epidural anesthesia, and balanced anesthesia.

Lumbar Analgesia with Hypobaric Tetracaine Hydrochloride: Spinal anesthesia induced with 0.1% solution of tetracaine hydrochloride was used in every instance because we believe this to be the safest form of spinal anesthesia available today.[6] A few of the advantages of this type of spinal anesthesia are especially noteworthy in cesarean sections. 1. The ability to maintain the Trendelenburg position throughout the operation aids in the prevention of shock and cerebral anoxia; if these conditions should intervene this position aids in their treatment. 2. Hypobaric tetracaine hydrochloride possesses physical properties that enable accurate control of its spread within the subarachnoid space. 3. The onset of anesthesia is rapid, and the duration of a single dose is adequate for this procedure. 4. Hypobaric tetracaine hydrochloride, 0.1% solution, being dilute is relatively nontoxic. There have been no postoperative neurological sequelae following lumbar analgesia other than headache.

Epidural Anesthesia: It should be emphasized that the administration of a large dose of a potent anesthetic solution in the epidural space is a potentially hazardous procedure, and therefore the anesthesiologist, regardless of how experienced, must always be vigilant and cautious. The technique employed in this series has special safety factors and requires a minimum of equipment. No waiting period has been found necessary after the initial injection of the anesthetic solution. The main advantage of epidural anesthesia is the absence of postanesthetic headaches. The ill repute that spinal anesthesia has received in both the lay press and the medical literature has further enhanced the value of epidural anesthesia.[7]

Balanced Anesthesia: A pleasanter and more rapid induction of anesthesia is made possible by the administration of 100 mg. of thiamylal sodium intravenously. This technique does not appear to cause more fetal depression than occurs when anesthesia is conducted with cyclopropane as the sole anesthetic agent.

Anesthesia Factor.—A mathematical analysis of the perinatal deaths in which anesthesia appeared to be a contributory factor revealed the following data.

Uncomplicated Cesarean Sections: In 318 sections done with conduction anesthesia, there were nine fetal deaths (2.8%). Anesthesia appeared to be a contributory factor in two of these (22%). In 132 sections done with balanced anesthesia there were five fetal deaths (3.8%). Anesthesia appeared to be a contributory factor in four of these (80%).

Complicated Cesarean Sections: In 150 sections done with conduction anesthesia, there were 30 deaths (20%). Anesthesia appeared to be a contributory factor in seven of these (23%). In 71 sections done with balanced anesthesia, there were 24 deaths (33.8%). Anesthesia appeared to be a contributory factor in six of these (25%).

Infant Resuscitation.—The fetus in utero lives in a state of cyanosis with a degree of oxygen unsaturation that is incompatible with extrauterine life. The infant after delivery must therefore quickly make physiological adjustments in his method of arterial oxygenation for survival. The chief causes of asphyxia of the newborn infant are encountered more frequently in delivery by the abdominal than by the vaginal route. The mortality rate of asphyxiated newborn infants is high if the child is not adequately resuscitated, and, since the infant delivered by cesarean section appears to have particular difficulty in making the necessary adjustments for extrauterine life, the importance of resuscitation following delivery by this method cannot be overemphasized.

Perinatal Mortality.—There are many known and unknown factors in the causation of intrauterine and neonatal mortality, some of which were referred to earlier. The clinical results obtained in this series are supported by various laboratory findings. 1. Taylor and co-workers [8] when studying blood oxygen saturation of the newborn infant found that a significantly higher percentage of infants reached saturations over 90% in one hour when regional anesthesia was used than when general or intravenously administered anesthetic agents were used. They concluded that some form of regional anesthesia should be used for deliveries complicated by factors such as fetal immaturity. 2. Several investigators have shown that premature infants are often unable to reach adequate blood oxygen saturations by the first hour of life as consistently as full-term infants.[9] Thus an attempt should be made to avoid the use of analgesic and anesthetic agents that depress the immature respiratory centers of premature infants. 3. Hingson found that fetal anoxia developed in almost every case in which a maternal hypotension of less than 80 mm. Hg existed for five minutes or longer. This indicates that fetal anoxia is not limited to general anesthetic agents. In this series artificial respiration, which was administered if spontaneous respirations were not established in one to two minutes after delivery, was required more frequently following balanced than regional anesthesia.

Intrinsic Fetal Mortality Rate.—I agree with Litchfield and co-workers,[10] who, in an analysis of 969 cesarean sections, found that fetal mortality was the result of the complication of the pregnancy necessitating the section rather than the section per se, and that this mortality rate can be reduced through appropriate obstetric and pediatric measures. In addition to these measures, however, this series indicates that anesthesia also plays an important role in infant mortality rates. It is therefore obvious that improvements in anesthetic methods and techniques can lower this mortality rate. This cannot be accomplished by considering "an intrinsic mortality rate" as the responsible factor.

CONCLUSIONS

An analysis of 671 consecutive cesarean sections established that: (1) the variations in infant mortality rates following cesarean sections conducted with modern anesthetic methods and techniques are statistically insignificant when the fetus is full term and no maternal or fetal complications are present; (2) there is a statistically significant variation in infant mortality rates following cesarean section conducted with various modern methods of anesthesia when the fetus is premature and/or various maternal or fetal complications are present (the fetal mortality rate under these circumstances is lower with conduction anesthesia than with balanced or general anesthesia); (3) in the interest of fetal salvage the use of the term "intrinsic mortality rate in cesarean section" should be discouraged; and (4) anesthesia has a marked influence on the infant mortality rate in cesarean section, the over-all infant mortality rate being slightly lower following conduction anesthesia than following balanced anesthesia.

Incidence of Cancer in Childhood.—During infancy and childhood—the first decade of life—90 per cent of malignant neoplasms develop in the blood or blood-forming organs, connective tissue, neural tissue or are tumors of embryonal or mixed tissues. . . . Around puberty (ten to fourteen years of age) the types of cancer are similar to those appearing during infancy and childhood. At this period of life, malignant neoplasms are more restricted as to site than at any other age period; 80 per cent occur in four tissues—brain, bone, hematopoietic and lymphatic. The termination of puberty is followed by a pronounced change both in the histological type and primary site of cancer. From infancy until puberty the incidence rate declines, and the vast majority of malignant tumors develop in a relatively few organs and tissues. Whatever the etiological agents during this period of life, their effect steadily decreases and by the end of puberty has become comparatively negligible. Immediately following puberty the incidence rate for all forms of malignant tumors begins to increase rapidly, so that by age twenty it again is as high as it was in early infancy. From then until the last years of the life span the incidence of cancer steadily increases. Not only does the incidence of cancer become greater, but the relative frequencies of both the histological types and primary sites also change markedly. The achievement of sexual maturity is followed by an increase in the incidence of malignant tumors arising in embryonal and mixed tissues—in the ovary in females and in the testis in males.—Harold F. Dorn, Ph.D., The Changing Incidence of Cancer Throughout Life, *Bulletin of the New York Academy of Medicine*, October, 1955.

POLYCYTHEMIA ASSOCIATED WITH OBESITY

Max H. Weil, M.D., Minneapolis

In severe grades of obesity, large deposits of fat cover the viscera and fat infiltrates the parenchyma of vital organs. These morphological changes may be reflected in a wide variety of physiological aberrations. Clinical hypertension, albuminuria, and cylindruria may follow excessive perirenal fat deposition. Liver cells, bulging with fat vacuoles, perform relatively poorly in clinical tests of hepatocellular function. The thoracic cavity may be crowded by fat from within and without, and the vital capacity is accordingly compromised with attendant dyspnea on minimal exertion. In a massively obese patient (case 1) who demonstrated rather marked metabolic aberrations of this type, polycythemia was also found. Of particular interest in this case was the complete disappearance of polycythemia with weight reduction and without any other therapy. The related metabolic disturbances were similarly reversed on low-calorie diet alone.

These findings suggested that a form of polycythemia may be related to obesity. In searching the literature, we learned that Baez Villaseñor and his co-workers[1] had found polycythemia in 12 of a group of 240 obese patients (5%) with hematocrits ranging as high as 77%. Howard and Mills[2] wrote of a plethoric type of obesity but elaborated no further on this hematological aspect. Lawrence and his group,[3] in their recent review, described "relative polycythemia" in eight obese patients. The highest observed hemoglobin level in these patients was 18.1 gm. per 100 cc. Their cases were characterized by a low plasma volume without absolute increase in red blood cell mass. However, Rynearson and Gastineau,[4] in their classic monograph on obesity, did not refer to obesity-related polycythemia.

In an effort to study the nature of this relationship further, 260 cases of clinical obesity treated in the University of Minnesota Hospitals were reviewed. These cases represented general hospital admissions, usually for causes other than obesity. Four markedly obese patients of this group, two males and two females, were found to have polycythemia. In each case the hemoglobin level was 19 gm. per 100 cc. or above sometime during the course of their hospitalization. In two of the four obese patients, polycythemia was transient and coincidental to the major illness for which they were being treated. In one case, the patient had clinical symptoms of erythremia but was discharged against advice before the nature of her polycythemia could be further studied. The fourth patient was extensively investigated with respect to polycythemia and certain unusual metabolic manifestations. His course is summarized in case 2.

The incidence of polycythemia in this group was 0.8%. It should be noted that persistent hemoglobin level elevation above 19 gm. per 100 cc. was arbitrarily accepted as unequivocal evidence of polycythemia. Since two of the obese patients had only transient hemoglobin level elevations to this point, they were not included in this calculation. The 0.8% incidence is therefore regarded as a conservative estimate. The over-all incidence of polycythemia at the University Hospitals (based on a total of 150,000 hospital admissions between 1938 and 1953) was 0.08%. Therefore, polycythemia appeared 10 times as frequently in the pathologically obese as contrasted with the unselected hospital population. A massively obese patient was being followed at the University Hospitals hematology clinic at the time of this study. Though he had polycythemia, clinicians had frequently indicated that polycythemia vera was an unsatisfactory diagnosis in his case. The clinical picture presented by this patient closely resembled the others to be described and is included in case 3.

REPORT OF CASES

CASE 1.—A 40-year-old man was admitted to the Minneapolis Veterans Administration Hospital on Oct. 27, 1953. He was referred for diagnostic studies because of albuminuria, obesity, and edema. At the age of 18, the patient weighed 220 lb. (99.88 kg.) and was 5 ft. 11 in. (180.34 cm.) tall. With an admittedly excessive food intake, weight gradually increased to 421 lb. (191.13 kg.). The greatest weight gain occurred after 1950, when the patient changed from construction labor to sedentary work. For six months previous to admission he had exertional dyspnea, orthopnea, ankle edema, and nocturia. Skin ulcerations over the ankles appeared spontaneously seven weeks before admission, and this caused him to consult his private physician. On Oct. 13, 1953, the patient was admitted to a local hospital because of marked albuminuria. Treatment with digitalis, mercurial diuretic, and an 800 calorie diet had resulted in a 40 lb. weight loss at the time of transfer to the Veterans Hospital two weeks later. On examination the patient was chronically ill but appeared somewhat younger than his stated age. He weighed 380 lb. (172.52 kg.). The blood pressure was 122/92 mm. Hg, and the other vital signs were not remarkable. Retinal veins were distended. Medium-pitched rhonchi were audible over both lung fields. Physical examination of the heart was not remarkable, but x-ray showed mild left ventricular prominence. Secondarily infected skin ulcers covered both medial malleoli. Mild varicosities and edema were evident in the lower extremities. The patient was given an 800 calorie diet supplemented with multiple vitamins. Except for treatment with intramuscularly administered penicillin and bacitracin dressings to the skin lesions, no other therapy was used.

On admission the hemoglobin level was 21.5 gm. per 100 cc. and the hematocrit was 73%. The red blood cell count was 6,160,000 per cubic millimeter, the white blood cell count was 9,750 per cubic millimeter, and differential count was normal. Platelet count was 114,000 per cubic millimeter, and the reticulocytes were 1.4%. The mean corpuscular volume was 118.5 cubic microns, mean corpuscular hemoglobin 25 micromicrograms, and mean corpuscular hemoglobin concentration 29%. Bone marrow smear and aspiration biopsy displayed no evidence of increased erythropoietic, myeloid, or megakaryocytic activity.

From the Department of Medicine, University of Minnesota Medical School, and the medical services, University Hospitals and Veterans Administration Hospital.

Read in part before the Minnesota Society of Internal Medicine, Duluth, Minn., May 22, 1954.

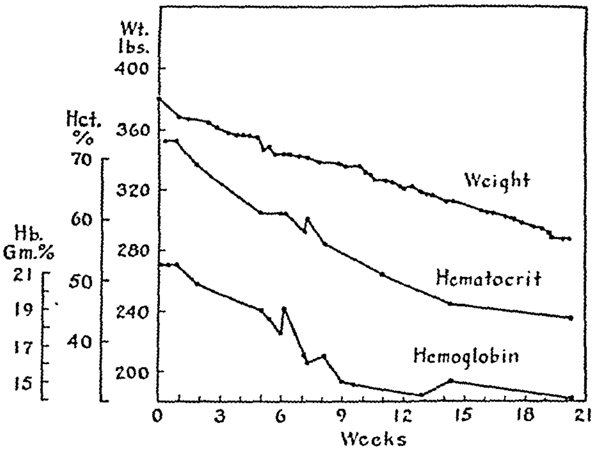
Urinary 17-hydroxycorticoid excretion was normal. The patient was kept under hospital observation for almost five months. He was fully cooperative and meticulous in adherence to diet. Subjective improvement accompanied weight reduction, especially in terms of respiratory reserve and increased physical maneuverability. Polycythemia subsided promptly (see figure). At the end of approximately two months and following the observed loss of 45 lb. (20 kg.) of body weight, the hemoglobin level fell to 15 gm. per 100 cc. and the hematocrit to 51%. Improvement in the various metabolic functions was gratifying (see table). Massive albuminuria subsided. Phenolsulfonphthalein excretion and urine-concentrating capacity became normal. The blood urea nitrogen fell to one-half of its earlier value, and the urinary sediment became normal. Liver function improved somewhat more slowly, but recovery was ultimately complete. Improvement in vital capacity was also notable. The fall in arterial hemoglobin saturation was surprising, and the direction of the change suggested that hypoxemia was not the cause of the patient's original polycythemia. During the period of hospital observation, the cardiac contour reverted to normal. Finally, it was of interest that the red blood cell indexes also improved so that the macrocytosis subsided. The mean corpuscular volume was 98 cubic microns, the mean corpuscular hemoglobin 31.8 micromicrograms, and the mean corpuscular hemoglobin concentration 33% by mid-March, 1954.

Renal, Hepatic, and Cardiorespiratory Function Before and Following an Observed Loss of Ninety Pounds of Body Weight (Case 1)

	Weight, by Date	
	380 Lb. (172.52 Kg.), 10/28/53	290 Lb. (141.66 Kg.), 3/10/54
Renal Function		
24 hr. urine protein, gm	9.72	0.13
Phenolsulfonphthalein excretion at 30 min., %	26	41
Maximum urine concentration	1.019	1.027
Blood urea nitrogen, mg. per 100 cc	20.5	10.0
Urinary sediment		
Hyaline casts per high-power field	30-40	1-2
Granular casts	4-6	0
White blood cells	4-6	Occasional
Red blood cells	1-2	Occasional
Hepatic Function		
Serum bilirubin, mg. per 100 cc.		
1 min	0.5	0.2
Total	2.3	1.5
Sulfobromophthalein (at 45 min.), %	48.4	27.8
Thymol turbidity, units	4.5	2.8
Cephalin flocculation at 48 hr	3 +	0
Zinc sulfate turbidity, units	19.7	16.7
Albumin-globulin ratio	4.4:3.6	3.8:2.7
Cardiorespiratory Function		
Vital capacity, liters		
Total	3.2	4.4
1 sec	2.2	2.5
Arterial oxygen saturation, %	90.8	84.5

On follow-up examination on May 20, 1954, seven months after admission, the weight had decreased to 259 lb. (117.59 kg.). Hemoglobin level was 14.5 gm. per 100 cc. There was a trace of albumin in the urine. Sulfobromophthalein and zinc sulfate turbidity tests were normal. Arterial oxygen saturation was 95.7% (normal, 96.4 to 100%). Subjectively, the patient was well. In late November, 1954, the weight had decreased to 226 lb. (102.5 kg.) and the urinalysis was negative.

Case 2.—A 28-year-old man was first referred to the University of Minnesota Hospitals Clinic in June, 1949, because of hypertension. He was 5 ft. 10 in. (177.8 cm.) tall and weighed 254 lb. (102.60 kg.), his maximum weight. In 1942 he was rejected for military service because of hypertension and albuminuria. A family history of hypertension and diabetes was obtained. His blood pressure was 180/100 mm. Hg and was unaffected by piperoxan (Benodaine) hydrochloride. Grade 1 albuminuria was detected. The hemoglobin level was 19.8 gm. per 100 cc., red blood cell count 6,070,000 per cubic millimeter, and the hematocrit 54%. In February, 1950, the patient was studied on the inpatient service for two weeks because of weakness, chest pain, diffuse abdominal pain, and burning fingertips. Trunk obesity and pink stria of the arms were observed. The blood pressure was 160/110 mm. Hg. A clinically suspected duodenal ulcer was visualized on x-ray study. Mild albuminuria persisted, and 1+ glycosuria was found. A glucose tolerance test suggested mild diabetes mellitus that was insulin resistant. The hemoglobin level was 19.8 gm. per 100 cc., red blood cell count 6,100,000 per cubic millimeter, and the hematocrit 56%. The white blood cell count was 14,450 per cubic millimeter with normal differential. Platelet count was normal. The blood volume, as determined by the dye method, was 6.8 liters. Slight elevation of thymol turbidity and zinc sulfate flocculation values indicated minimal hepatocellular dysfunction. Renal function was essentially normal. The albumin-globulin ratio was 3.6:3.4. Bone marrow smear and biopsy were essentially normal. An electrocardiogram showed nonspecific myocardial damage. Urinary 17-ketosteroid, 11-oxysteroid excretion, and eosinophil counts were normal. Roentgen therapy to the pituitary gland (with a total of 2,460 r deep dose) was administered without effect. Phlebotomies were performed with symptomatic improvement at approximately monthly intervals following his discharge from the hospital. Four courses of radioactive phosphorus (5.5 mc. in February, 1950, 3 mc. in April, 1951, 4 mc. in November, 1951, and 4 mc. in February, 1953) did not affect the polycythemia. The highest observed hemoglobin level was 21.6 gm. per 100 cc. and the highest hematocrit, 56%. The white blood cell count varied from normal to a high of 18,700 per cubic millimeter, but platelet counts were consistently normal.



Relationship of hematocrit and hemoglobin level to weight loss (case 1).

In December, 1953, the patient was readmitted to the hospital for one week because of shortness of breath, chest pain on exertion, and ankle swelling. He appeared moderately plethoric. His blood pressure was 160/90 mm. Hg. Weight was essentially unchanged. Urinalysis revealed 2+ albumin. Hemoglobin level was 18.2 gm. per 100 cc., red blood cell count was 6,110,000 per cubic millimeter, and white blood cell count was 9,750 per cubic millimeter with normal differential. Arterial hemoglobin saturation was 92.8%. Blood studies, including urea nitrogen, carbon dioxide, sodium, and potassium, were again normal. Liver function was normal. X-ray studies of the bony skeleton and gastrointestinal tract and an intravenous pyelogram were essentially negative. Urinary 17-hydroxysteroids were excreted in normal quantity. Since his last admission, symptoms have persisted and weight remains unchanged. Phlebotomies continue to offer transient relief.

Case 3.—A 50-year-old man was first examined at the University Hospitals Clinic in April, 1948. He was 5 ft. 11 in. (180.34 cm.) tall and weighed 305 lb. (138.47 kg.), having lost 40 lb. of weight in the previous half year. His maximum weight, 10 years earlier, had been 418 lb. (189.77 kg.). The patient's private physician had found glycosuria and a diabetic glucose tolerance curve three weeks before. The initial hemoglobin level was 17.9 gm. per 100 cc., and the red blood cell count was 5,800,000 per cubic millimeter. Low-calorie diet was prescribed but poorly adhered to. In February, 1950, the patient's hemoglobin level was 17.5 gm. per 100 cc., the red blood cell count was 6,100,000 per cubic millimeter, and the hematocrit was 53%. The white blood cell count and differential count were normal. He complained of tingling in his hands and feet and a sensation of pressure in his head. A 700 cc. phlebotomy gave prompt relief. Phlebotomies were repeated at the patient's request at approximately monthly intervals. During the ensuing period, the highest hemoglobin level observed was 19.2 gm. per 100 cc. and the highest hematocrit, 54%. Platelet counts were within normal limits. Two courses of treatment with radioactive phosphorus (4 mc. in June, 1951, and 6 mc. in July, 1952) were without effect. Weight was maintained at about 300 lb. (136.20 kg.), repeated admonition regarding diet notwithstanding. A daily insulin requirement of 70 units of isophane (NPH) insulin gradually established itself over the ensuing three years. A bone marrow biopsy (June, 1954) revealed a high normal fat content, and cell study lends no support to the clinical diagnosis of polycythemia vera.

COMMENT

Polycythemia related to obesity appears to be sufficiently distinctive with respect to its clinical manifestation and its therapy to warrant separate consideration. This syndrome must accordingly be differentiated from polycythemia vera and the secondary polycythemias (of hypoxemia). In the reported cases, no change in the peripheral blood picture was found, except for the increased number, and perhaps increased size, of the red blood cells. In polycythemia vera, the white blood cell count is commonly elevated. The myeloid leukocytes are both relatively and absolutely increased and immature red and white blood cells are often seen in the peripheral blood. The platelet count is frequently excessive.[5] By contrast, no such white blood cell or platelet alterations were observed in these cases. The bone marrow in polycythemia vera is characteristically very cellular. Myeloid, erythroid, and megakaryocytic elements contribute to diffuse hyperplasia. The volumetric pattern of such bone marrow indicates an appreciable increase of the myeloid-erythroid layer at the expense of the fat layer.[6] In the three cases described, bone marrow smear, biopsy, and hematocrit did not demonstrate these changes. Splenomegaly was observed in 90% of Wintrobe's 21 cases of polycythemia vera.[5] Though palpation is an admittedly unreliable technique in very obese individuals, splenomegaly was both clinically and roentgenographically sought. No splenomegaly was found in the present cases. Neither of the two patients who were treated with radiophosphorous obtained any detectable blood cell suppression from this therapy. Subjective symptoms, including dyspnea, headache, blurred vision, tingling of fingers and toes, and ill-defined malaise, were recorded for the obese patients. In this respect they resembled those of polycythemia due to other causes.

Impaired arterial oxygen saturation in chronic pulmonary disease, congenital (and certain cases of acquired) heart disease, syphilis of the pulmonary artery (*Ayerza's syndrome*), *high altitudes*, and related conditions may result in secondary polycythemia. These patients are commonly cyanotic. Secondary polycythemia and polycythemia of obesity both demonstrate a normal peripheral blood picture. In secondary polycythemia, however, the bone marrow responds to chronic hypoxemia with diffuse hyperplasia of all elements.[7] Moreover, the *sine qua non* of this type of polycythemia is a marked decrease in oxygen saturation of an arterial blood sample. In the present cases, no cyanosis was observed. Bone marrow changes were essentially absent. The arterial oxygen saturation, determined in two cases, yielded slightly lower than normal values. Polycythemia of obesity differs from secondary (or hypoxemic) polycythemia in that arterial oxygen saturation is only slightly depressed. The relationship between polycythemia and the various metabolic dysfunctions observed in these patients requires further study. The role of obesity was particularly well illustrated in the first case. Renal function was decreased, and the presence of marked albuminuria suggested serious kidney pathology. The elevated serum bilirubin, marked sulfobromophthalein retention, and abnormal flocculation tests indicated liver involvement. The vital capacity increased with weight reduction. The polycythemia decreased along with improvement in kidney, liver, and respiratory function. In the other cases, weight reduction was unfortunately not achieved and both polycythemia and metabolic aberrations persisted. The triad of hypertension, polycythemia, and impaired glucose tolerance is suggestive of adrenocortical hyperfunction (Cushing's syndrome). The clinical observations and normal urinary steroid studies, however, excluded this diagnosis.

SUMMARY AND CONCLUSIONS

A markedly obese patient (case 1) had polycythemia and certain renal, hepatic, and cardiorespiratory abnormalities. These manifestations were reversed with weight reduction alone. A 5% incidence of polycythemia in obese patients had previously been reported by Mexican authors. Two hundred sixty cases of obesity were subsequently reviewed. Four cases of polycythemia were found in this group. In the present study, polycythemia occurred 10 times more frequently in pathologically obese patients in comparison to the total patient population. In three cases of obesity-related polycythemia studied with respect to this problem, the clinical findings differ sufficiently from polycythemia vera and secondary polycythemia (of hypoxemia) to warrant separate classification of this syndrome. Unlike polycythemia vera there appears to be no increase in immature cells, white blood cells, or platelets in the peripheral blood, and the bone marrow does not display hyperplasia. Splenomegaly is absent, and moderate doses of radiophosphorus do not influence the blood cell count. The arterial oxygen saturation is only slightly depressed, and cyanosis is absent. The condition may occur in association with cardiorespiratory, liver, and renal dysfunction. The

underlying cause of these manifestations is thought to be excessive adiposity. Weight reduction without other therapy may be curative.

ADDENDUM

Polycythemia of obesity has been found in two additional patients and was reversed in both cases by dietary weight reduction. Later studies have characterized this condition as a form of secondary polycythemia due to inadequate pulmonary ventilation, presumably because of the mechanical barrier created by fat. Since arterial oxygen saturation is only slightly depressed, it is postulated that only the most sensitive individuals respond with polycythemia. The relative rarity of the condition is thereby explained.

DIVISION OF TIBIAL COLLATERAL LIGAMENT FOR REMOVAL OF MEDIAL MENISCUS

Julius S. Neviaser, M.D., Washington, D. C.

Many operative approaches have been described and an assortment of special knives or retractors have been devised to facilitate the complete removal of the medial meniscus from the knee joint. The most simple and direct surgical approach is by division of the tibial collateral ligament. This study constitutes a review of 68 patients operated on for removal of the medial meniscus by this procedure. In addition, four other patients had the fibular collateral ligament divided for complete removal of the lateral meniscus because of large cyst formations. This series of cases, covering a period of eight years' experience, has proved that the ultimate stability of the knee joint is not impaired.

Eight years ago I was removing a torn medial meniscus by the usual anterior medial approach. As the anterior portion of the cartilage was freed and pulled forward with a Kocher clamp, the cartilage, which apparently was extremely friable, yet firmly fixed posteriorly, ruptured transversely and recoiled suddenly into the back of the joint. It was impossible to draw it forward, so an incision was made behind the tibial collateral ligament to reach the posterior portion of the cartilage. Even after freeing this part of the cartilage it could not be removed, although the short anterior end was passed backward through the posterior medial opening in the capsule. It was evident that further attempts at mobilization of the cartilage would continue to traumatize the articular surface of the joint; therefore, as a last resort, the tibial collateral ligament was divided. Only then did I realize how easy it was to expose and remove the cartilage completely. The patient made an uneventful recovery without any instability after suture of the ligament. From this experience evolved the decision to use this approach as the routine surgical procedure for removal of the medial meniscus.

It should be mentioned here that this form of approach has been advocated by others in the past. Tavernier,[1] in 1933, published a series of 73 meniscectomies in which he made a transverse incision with section of the internal ligament. His results were excellent, with no laxity or lack of stability of the knee. He urged the English-speaking surgeons to adopt this procedure. Monod [2] and Cadenat [3] also suggested the sectioning of the ligament for complete removal of the cartilage. In 1953, Aufranc [4] recommended releasing the lateral ligaments from the femoral condyle for better visualization and easier removal of the meniscus.

ANATOMY

There are two distinct parts to the tibial collateral ligament (fig. 1). The superficial part, which is the larger and longer, arises from the medial epicondyle of the femur to insert into the medial condyle of the tibia about 2 in. (5.08 cm.) below knee joint level. The anterior border of this strong, broad, flat, and triangular ligament is vertical, but its posterior border is oblique above and below so that its widest part is over the medial meniscus at the joint space. The deep part of the ligament is attached to the articular margins of the femur and tibia on their medial aspects and is continuous with the capsule of the knee joint in front and behind, thus forming part of the capsule of the joint. This deep layer is attached closely to the medial meniscus. The two layers of this ligament are fused into a single structure above but tend to separate below. Strong, resistant, fibrous supports, called the medial patellar retinaculum, run from the medial border of the patella toward the anterior border of the upper part of the tibial collateral ligament. In a fully extended knee, the collateral ligaments are taut. This tension on the tibial collateral ligament is distributed throughout its width in extension. However, in flexion, the area of tension is shifted to the anterior portion of its fibers while the posterior portion is relaxed.

OPERATIVE TECHNIQUE

A horizontal, very slightly curved incision is made at the level of the knee joint, beginning about 1 in. (2.54 cm.) medial to the ligamentum patellae and running backward toward the posterior margin of the medial femoral condyle (fig. 2). The superficial layer of the tibial collateral ligament is exposed at its anterior as well as its posterior borders. A small transverse incision is made in the medial patellar retinaculum just forward of the anterior border of the ligament. A narrow periosteal elevator is then passed through this opening under the medial ligament immediately above the attachment of the medial meniscus to come out behind the posterior border of the ligament (fig. 3). This simple maneuver

[4] Aufranc, O. E.: Personal communication to the author.

In three cases minimal instability of the knee joint was noted after one year when the leg was flexed to 165 degrees; however, this disappeared when the patient was instructed to contract the quadriceps. In spite of this finding, the patients had no complaints, and it is still questionable whether this minimal instability had any significance. Six patients had demonstrable atrophy of the quadriceps that persisted for six months or longer; however, all returned to normal somewhere between 18 to 30 months after surgery. This delay in the return of quadriceps size was probably related to the fact that these patients had muscle atrophy and knee complaints for at least a month prior to surgery. In addition, five of the six patients presented other pathology besides meniscus injury at operation. In spite of the persistent measurable diminution in the circumference of the thigh, no real diminution in the strength of this muscle group could be demonstrated. Tavernier also noted this unusual finding.

Seven patients developed fluid in the knee joint when active motion was instituted after removal of the plaster. They required restricted activity and aspirations, the swelling eventually disappearing in from three to eight weeks' time. Two of these patients were in the group with quadriceps atrophy that persisted after six months. In one case in which both medial and lateral meniscuses were removed, the synovitis persisted for eight months. One cannot attribute joint effusion to the operative approach but rather to a complication of knee joint surgery.
a common and annoying complication that many
edic surgeons experience.

SUMMARY AND CONCLUSIONS

CLINICAL USE OF FLUDROCORTISONE ACETATE

PRELIMINARY REPORT

George J. Hamwi, M.D.
and
Robert F. Goldberg, M.D., Columbus, Ohio

REPORT OF CASES

CASE 1.—The first case in which this medicament was
that of a 40-year-old woman with anorexia *nervosa* who
had gradually decreased to 84 lb. (38.6 kg.) and who
responded to other therapy. She received 2 mg. of fludro
acetate daily for 13 days and within two days expe
sense of well-being. Dietary intake, previously abo
calories daily, increased to over 2,000 calories, and h
increased to 99 lb. (44.9 kg.). After cessation of treat
patient had a brief period of mild depression, but calo
continued high. Within four days her weight decreased
(42.2 kg.), suggesting *fluid loss. Adrenal responsiv*
exogenous corticotropin (ACTH) before and during the
shown by increased urinary steroid excretion (fig. 1), i
no inhibition of corticotropin effect on the adrenal c
the dosage given.

POSTOPERATIVE COURSE

The postoperative course of all patients was similar, that they all could walk a day or two after surgery with minimal amount of pain. As a rule these patients did not develop any postoperative knee effusion, hemarthrosis, or any ankle or foot swelling. This could be related to the compression of the knee and leg afforded by the plaster. It also tended to lessen the chances for any postoperative phlebitis by compressing the superficial veins and forcing the return of blood through the deep veins. The average length of hospital stay for all patients was six days.

FINDINGS AT OPERATION

The most common medial meniscus injury was the complete longitudinal tear (fig. 6). This occurred in 29 cases (table 1). This is the usual bucket-handle tear, which is relatively easy to diagnose as it is generally associated with locking. The next most frequent lesion seen was the longitudinal tears of the posterior segment. This type of injury would have been missed by the usual anterior medial approach, particularly in two cases where the split was found on the under surface of the posterior segment. There were 11 cases with various combinations of longitudinal and transverse tears. In two cases of this group, besides the multiple splits, there were pedunculated tags present about the inner half of the meniscus, and, in another, there was a polypoid type of hypertrophy at the concave side of the meniscus. It was very evident that in such cases it would be well to have the meniscus removed completely. In the five cases of cyst formation of the medial meniscus, there was some form of injury to the meniscus. In as much as all of these cases showed the cysts present posteriorly, the advantage of a complete exposure of the inner half of the knee joint is obvious.

As noted in table 1, in five cases there were loose bodies associated with the meniscus injury. These were removed, as well as the osteochondral bodies found in the seven cases of osteochondritis dissecans. This was easily accomplished through the described operative approach. Sufficient exposure was possible to note pathology in the lateral meniscus in three cases. Two patients had discoid lateral meniscuses, and one had an oblique transverse tear of the lateral cartilage. In these instances, the lateral meniscus was removed by a separate anterior lateral incision. The postoperative management of these three cases was similar to those in which the medial meniscus was removed alone. In four cases of cysts of the lateral meniscus, the fibular collateral ligament was sectioned. In each instance these large firm cysts were situated at the joint line just under and in front of the lateral ligament, and by cutting the ligament it was possible to remove the cyst with the cartilage completely (fig. 7 and 8).

RESULTS

Follow-up examinations in all cases were conducted frequently and regularly, as all were seen and treated by me in my private practice. The period of follow-up varied from three months to eight years and averaged 46.3 months in 68 cases (table 2). Our main concern when checking and evaluating these patients consisted of four questions: 1. What was the functional result? 2. How soon after operation was the patient able to return to work? 3. Was there any permanent instability of the knee joint? 4. Were there any complications to the operative limb that could be the result of the operative approach?

The functional result in all cases was good. Private patients returned to their vocational activities on an average of 6.2 weeks after surgery, and in industrial cases patients resumed work 8.1 weeks after surgery. This discrepancy is best explained by the lack of incentive to return to work, coupled with the fact that in the industrial case the patient usually returns to heavy labor associated with the manual trades. This still is a relatively short period of time, when one considers that the average age in these cases was between the third and fourth decades of life. Two children that are included in this series, aged 12 and 13, returned to school two and five weeks after surgery. The younger one was able to resume acrobatic dancing five weeks after surgery.

isolates the ligament; the instrument also is a guide for the line of incision through the ligament. Retention sutures of no. 1 absorbable surgical suture are then placed in the ligament above and below the site of division (fig. 4). The ligament is divided transversely over the periosteal elevator. When this is done, the inner aspect of the knee joint can be easily and fully inspected by abducting the leg. The medial meniscus can then be completely removed by severing its attachments around the peripheral margins of the head of the tibia (fig. 5). Any other joint pathology can be treated, if necessary. Closure is accomplished by resuturing the ligament with the knee in extension and adducting the leg as much as possible. After skin closure, a plaster walking cylinder is applied with the knee in extension. It extends from the upper thigh to above the ankle. The next day the patient is allowed to walk and is encouraged to move about. The plaster is generally removed in about three weeks,

It also tended to lessen the chances for any postoperative phlebitis by compressing the superficial veins and forcing the return of blood through the deep veins. The average length of hospital stay for all patients was six days.

Quadriceps Atrophy After 6 Mo.	
Cases	6

FINDINGS AT OPERATION

The most common medial meniscus injury was the complete longitudinal tear (fig. 6). This occurred in 29 cases (table 1). This is the usual bucket-handle tear, which is relatively easy to diagnose as it is generally associated with locking. The next most frequent lesion seen was the longitudinal tears of the posterior segment. This type of injury would have been missed by the usual anterior medial approach, particularly in two cases where the split was found on the under surface of the posterior segment. There were 11 cases with various combinations of longitudinal and transverse tears. In two cases of this group, besides the multiple splits, there were pedunculated tags present about the inner half of the meniscus, and, in another, there was a polypoid type of hypertrophy at the concave side of the meniscus. It was very evident that in such cases it would be well to have the meniscus removed completely. In the five cases of cyst formation of the medial meniscus, there was some form of injury to the meniscus. In as much as all of these cases showed the cysts present posteriorly, the advantage of a complete exposure of the inner half of the knee joint is obvious.

As noted in table 1, in five cases there were loose bodies associated with the meniscus injury. These were removed, as well as the osteochondral bodies found in the seven cases of osteochondritis dissecans. This was easily accomplished through the described operative approach. Sufficient exposure was possible to note pathology in the lateral meniscus in three cases. Two patients had discoid lateral meniscuses, and one had an oblique transverse tear of the lateral cartilage. In these instances, the lateral meniscus was removed by a separate anterior lateral incision. The postoperative management of these three cases was similar to those in which the medial meniscus was removed alone. In four cases of cysts of the lateral meniscus, the fibular collateral ligament was sectioned. In each instance these large firm cysts were situated at the joint line just under and in front of the lateral ligament, and by cutting the ligament it was possible to remove the cyst with the cartilage completely (fig. 7 and 8).

RESULTS

Follow-up examinations in all cases were conducted frequently and regularly, as all were seen and treated by me in my private practice. The period of follow-up varied from three months to eight years and averaged 46.3 months in 68 cases (table 2). Our main concern when checking and evaluating these patients consisted of four questions: 1. What was the functional result? 2. How soon after operation was the patient able to return to work? 3. Was there any permanent instability of the knee joint? 4. Were there any complications to the operative limb that could be the result of the operative approach?

The functional result in all cases was good. Private patients returned to their vocational activities on an average of 6.2 weeks after surgery, and in industrial cases patients resumed work 8.1 weeks after surgery. This discrepancy is best explained by the lack of incentive to return to work, coupled with the fact that in the industrial case the patient usually returns to heavy labor associated with the manual trades. This still is a relatively short period of time, when one considers that the average age in these cases was between the third and fourth decades of life. Two children that are included in this series, aged 12 and 13, returned to school two and five weeks after surgery. The younger one was able to resume acrobatic dancing five weeks after surgery.

In three cases minimal instability of the knee joint was noted after one year when the leg was flexed to 165 degrees; however, this disappeared when the patient was instructed to contract the quadriceps. In spite of this finding, the patients had no complaints, and it is still questionable whether this minimal instability had any significance. Six patients had demonstrable atrophy of the quadriceps that persisted for six months or longer; however, all returned to normal somewhere between 18 to 30 months after surgery. This delay in the return of quadriceps size was probably related to the fact that these patients had muscle atrophy and knee complaints for at least a month prior to surgery. In addition, five of the six patients presented other pathology besides meniscus injury at operation. In spite of the persistent measurable diminution in the circumference of the thigh, no real diminution in the strength of this muscle group could be demonstrated. Tavernier also noted this unusual finding.

Seven patients developed fluid in the knee joint when active motion was instituted after removal of the plaster. They required restricted activity and aspirations, the swelling eventually disappearing in from three to eight weeks' time. Two of these patients were in the group with quadriceps atrophy that persisted after six months. In one case in which both medial and lateral meniscuses were removed, the synovitis persisted for eight months. One cannot attribute joint effusion to the operative approach but rather to a complication of knee joint surgery. This is a common and annoying complication that many orthopedic surgeons experience.

SUMMARY AND CONCLUSIONS

In a series of 72 cases, the tibial collateral was sectioned in 68 cases and the fibular collateral lig ment was sectioned in 4 cases to facilitate removal of medial or lateral meniscus. The value of this procedu was confirmed by the pathology visualized at surger a good part of which would have remained unnoticed the conventional approaches had been utilized. T slightly longer period of immobilization necessitated the wearing of a plaster walking cylinder has its compensations in allowing the patient early nonsupporte weight bearing, as well as decreased potential for embolic phenomena.

The advantages gained by division of the tibial co lateral ligament are: 1. The medial meniscus is completely removed. 2. Operative trauma is diminishe The prolonged stretching and forcible retraction of th capsule and synovial membrane, which may cause pe sistent postoperative synovitis, is eliminated. Any te dency of scarring the articular cartilages is avoided. Cysts of the meniscus can be removed with the menisc in one piece. 4. Inspection of more than half of the joi is facilitated (fig. 9). This allows for further investig tion and treatment, if necessary, of any other joint p thology, such as removal of loose bodies, damage the cruciate ligaments (fig. 10), osteochondritis di secans, or damage to the lateral meniscus. 5. A subs quent operation for removal of the posterior segment the meniscus is avoided.

CLINICAL USE OF FLUDROCORTISONE ACETATE

PRELIMINARY REPORT

George J. Hamwi, M.D.
and
Robert F. Goldberg, M.D., Columbus, Ohio

Halogenation of cortisone and hydrocortisone in the 9-α position has been shown [1] to alter the effects of these compounds both qualitatively and quantitatively. Fludrocortisone acetate (9-α-fluorohydrocortisone) was shown to have a cortisone-like effect in adrenalectomized dogs averaging approximately 20 times as great, milligram for milligram, as hydrocortisone. It was also shown to have an effect on mineral metabolism similar to desoxycorticosterone (Doca) acetate but averaging five times as great as desoxycorticosterone. In order to evaluate the effect of this medication we have administered fludrocortisone acetate to several patients with diseases that have been found amenable to adrenal steroid therapy.

REPORT OF CASES

Case 1.—The first case in which this medicament was used was that of a 40-year-old woman with anorexia nervosa whose weight had gradually decreased to 84 lb. (38.6 kg.) and who had not responded to other therapy. She received 2 mg. of fludrocortisone acetate daily for 13 days and within two days experienced a sense of well-being. Dietary intake, previously about 1,200 calories daily, increased to over 2,000 calories, and her weight increased to 99 lb. (44.9 kg.). After cessation of treatment the patient had a brief period of mild depression, but caloric intake continued high. Within four days her weight decreased to 93 lb. (42.2 kg.), suggesting fluid loss. Adrenal responsiveness to exogenous corticotropin (ACTH) before and during therapy was shown by increased urinary steroid excretion (fig. 1), indicating no inhibition of corticotropin effect on the adrenal cortices in the dosage given.

In this case of anorexia nervosa a marked sense of well-being and increased appetite resulted from treatment with fludrocortisone acetate. The patient gained 13 lb. (5.9 kg.) of weight, approximately 6 lb. (2.7 kg.) of which were probably due to water retention. Fludrocortisone acetate did not prevent response of the adrenal cortices to corticotropin.

From the Division of Endocrinology and Metabolism, Department of Medicine, Ohio State University.

This study was supported by grants from the Comly-Coleman Fund, the Institute of Nutrition of Ohio State University, and Merck & Company, Inc., Rahway, N. J.

The fludrocortisone acetate (9-α-fluorohydrocortisone) and the cortisone used in this study were supplied by Dr. Elmer Alpert of Merck & Company, Inc., Rahway, N. J. The desoxycorticosterone acetate was supplied by Ciba Pharmaceutical Products, Inc., Summit, N. J.

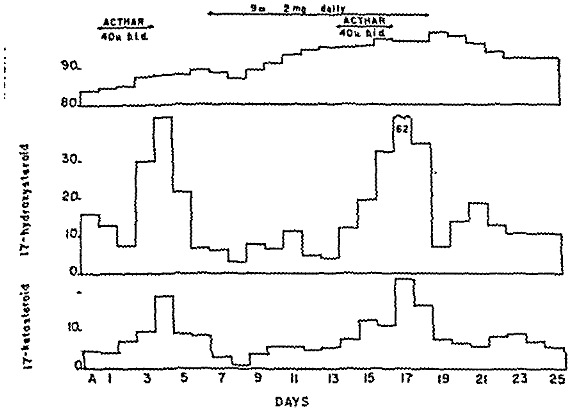
ASE 2.—The next case in which this compound was used that of a 19-year-old female with adrenogenital syndrome nifested by facial hirsutism and irregular menses. Urinary retion of 17-ketosteroids averaged 18.4 mg. in 24 hours and eased to 25.6 mg. after the intravenous administration of units of corticotropin over an 8 hour period. A dose of 3 mg. fludrocortisone acetate was given daily for four days, during



ig. 1.—Weight gain in patient (case 1) receiving fludrocortisone acetate -fluorohydrocortisone) therapy and increased urinary excretion of roids following corticotropin (ACTH) before and during medication a patient with anorexia nervosa.

ich time there was a persistent decrease in the urinary excre-n of 17-ketosteroids and 17-hydroxycorticoids (fig. 2). She was bsequently treated with 30 mg. of hydrocortisone daily and s resumed normal menses.

In this patient fludrocortisone acetate caused a defi-te decrease in the urinary excretion of 17-ketosteroids d 17-hydroxycorticoids, indicating its ability to in-bit the secretion of corticotropin from the pituitary.

CASE 3.—Fludrocortisone acetate was used in a 20-year-old male with an acute exacerbation of chronic recurrent choroid-s. In order to demonstrate the effect of this compound on dium, potassium, chloride, calcium, phosphorus, and nitrogen tabolism, the patient was placed on an isocaloric diet constant

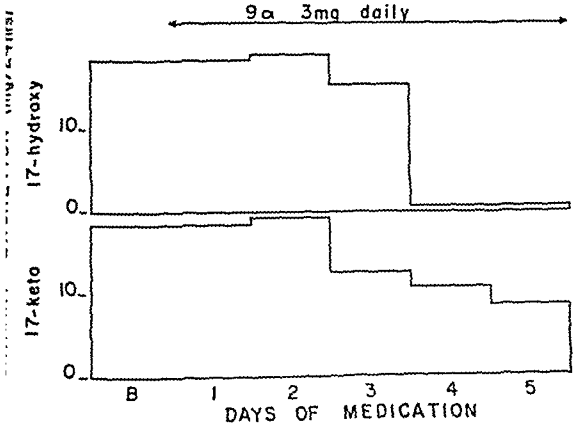


Fig. 2.—Urinary excretion of steroids in patient (case 2) showing de-ase of both 17-hydroxycorticoids and 17-ketosteroids while receiving drocortisone acetate (9-α-fluorohydrocortisone).

r these substances. Complete urine specimens and stool col-ctions were obtained. The therapy consisted of two three-day riods with 8 mg. of fludrocortisone acetate daily, one three-y period with 4 mg. daily, and initial and terminal three-day ntrol periods. Frequent evaluation showed progressive im-ovement of the choroiditis while the patient was receiving erapy. The results of the metabolic studies are shown in fig. 3.

In this patient an anti-inflammatory response to fludrocortisone acetate was observed similar to that which might have been expected from cortisone or hydrocortisone. Retention of sodium and chloride occurred as well as increased excretion of potassium. The catabolic effect of this compound was evidenced by loss of nitrogen, phosphorus, and calcium.

CASE 4.—A 52-year-old female with chronic rheumatoid arthritis treated with salicylates, cortisone, hydrocortisone, and phenylbutazone (Butazolidin) was evaluated for anemia of four months' duration that had been severe enough to require multiple blood transfusions. Because of the presence of splenomegaly, normochromic anemia, leukopenia with lymphocytosis, normal blood platelet counts, and a hyperplastic bone marrow, the diagnosis of Felty's syndrome was made. In order to determine the effect of fludrocortisone acetate on the joint inflammation and the hematological disorder as well as to obtain further information about the metabolic effects of the medicament, the patient was placed on an isocaloric diet constant for sodium, potassium, chloride, calcium, phosphorus, and nitrogen. Urine and stool determinations were obtained during the study period, and periodic blood studies and hematological evaluations were made. During a three day control period when all treatment was withheld, an acute exacerbation of the arthritis occurred. A dose of 12 mg. of fludrocortisone acetate was then given daily for three days. Within four hours of initiation of therapy, symptomatic relief occurred followed by disappearance of signs of active inflammation in the joints. During the following three day period, 6 mg. was insufficient to completely control the disease. Corticotropin, 25 units, intravenously over an eight hour period, was given for three days with complete remission again. During the studies no appreciable change in the hematological picture occurred. Results of the metabolic studies are shown in figure 4.

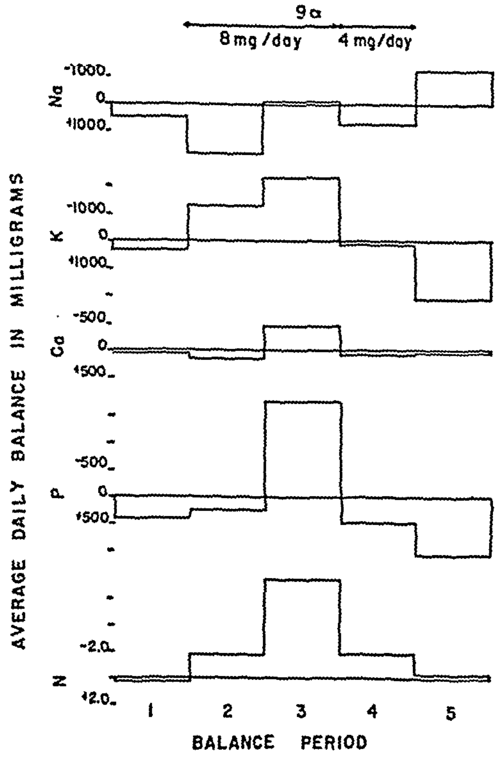

Fig. 3.—Metabolic balance study in patient (case 3) demonstrating retention of sodium and loss of potassium, calcium, phosphorus, and nitrogen while receiving fludrocortisone acetate (9-α-fluorohydrocortisone).

In this patient the anti-inflammatory effect of this compound in sufficient dosage was again demonstrated. Sodium and chloride retention was again shown, as was decreased retention of potassium. Both nitrogen and phosphorus were retained to a lesser extent while the patient was receiving medication than during the control period. Calcium loss, though delayed, was observed. This compound was used in two cases of adrenal surgery as complete replacement therapy.

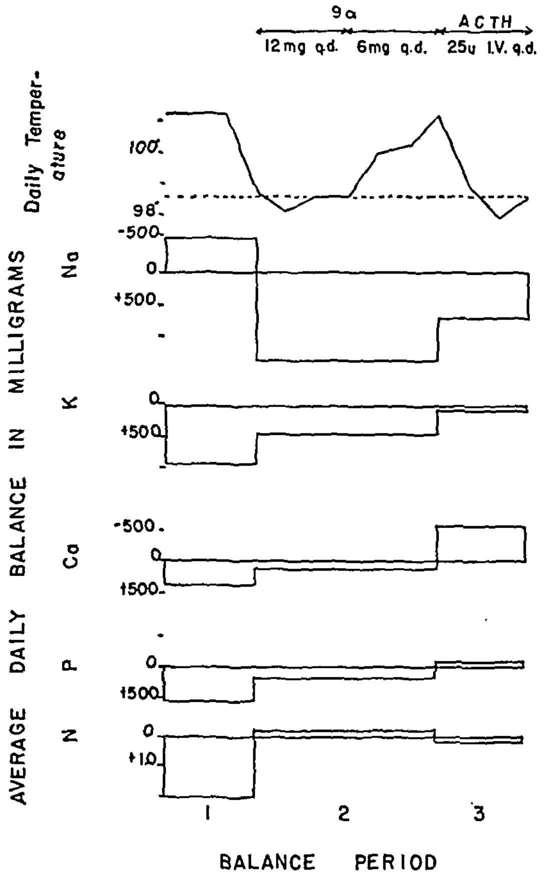

Fig. 4.—Metabolic balance study in patient (case 4) showing sodium retention; diminished retention of potassium, nitrogen, and phosphorus, and calcium loss while receiving fludrocortisone acetate (9-α-fluorohydrocortisone).

Case 5.—A subtotal adrenalectomy was performed on a 7-year-old boy who had developed adrenal cortical hyperfunction (Cushing's syndrome) confirmed by laboratory studies. During the day of surgery and each of the following two days 2 mg. of fludrocortisone acetate intravenously was sufficient to maintain the blood pressure and the serum electrolytes. This was the only substance used as replacement for the adrenal cortex. Whenever use of the medicament was temporarily stopped, hypotension resulted. A dose of 2 mg. daily was given orally for an additional 12 days before therapy was gradually discontinued.

Case 6.—A total bilateral adrenalectomy was performed as palliation on a 47-year-old woman who had diffuse metastases from breast carcinoma. No replacement therapy was given until one hour before the procedure, at which time 10 mg. of fludrocortisone acetate was given in an intravenous infusion of glucose in water. A dose of 5 mg. had been given by the time excision of the adrenals was completed, and a total of 15 mg. was given during the operative day. The blood pressure was maintained evenly throughout surgery and the postoperative period. She was subsequently given between 5 and 10 mg. of fludrocortisone acetate intravenously daily for five days, and for an additional week she was given 3 mg. orally before cortisone and desoxycorticosterone acetate were substituted. No complications of therapy were seen except on one occasion, when hypotension developed, resulting from a reaction to a blood transfusion. This was readily controlled by an additional 5 mg. of fludrocortisone acetate. Although prior to surgery urinary excretion of 17-hydroxycorticoids were in the normal range, after adrenalectomy none were found in the urine despite apparently adequate replacement therapy with fludrocortisone acetate.

Cases 5 and 6 illustrate the ability of fludrocortisone acetate to satisfactorily maintain adrenalectomized patients during the operative and postoperative periods. That this substance does not directly increase the urinary excretion of 17-hydroxycorticoids was shown by their absence in the urine in the patient in case 6 following adrenalectomy. Consequently, this compound may be used in the treatment of acute adrenal insufficiency without interfering with the diagnostic significance of urinary steroid excretion. Fludrocortisone acetate was used for six patients with adrenal cortical hypofunction (Addison's disease) in order to evaluate its potentiality as complete substitution therapy.

Case 7.—A 49-year-old female with known adrenal cortical hypofunction of two years' duration had been maintained on 10 mg. of cortisone and 10 mg. of desoxycorticosterone given sublingually. She was placed on a diet with sodium intake constant at 900 mg. and potassium 2,600 mg. After baseline urinary excretion of sodium, potassium, and chloride was determined, the patient was given 500 mg. of acetazolamide (Diamox) to induce adrenal insufficiency. Within 26 hours, weakness, emesis, tachycardia, and hypotension occurred and serum electrolytes were altered. A dose of 5 mg. of fludrocortisone acetate was then given intravenously in 5% glucose in water over four hours. Within two hours nausea was no longer present, and within five hours most of the symptoms had disappeared. Hourly urine studies, as shown in figure 5, indicated marked decrease in the sodium and chloride excretion as well as potassium diuresis. She was subsequently maintained free of symptoms with 3 mg. of the compound daily, but within 10 days had gained 12 lb. (5.4 kg.) of weight and was dyspneic. Medication was stopped

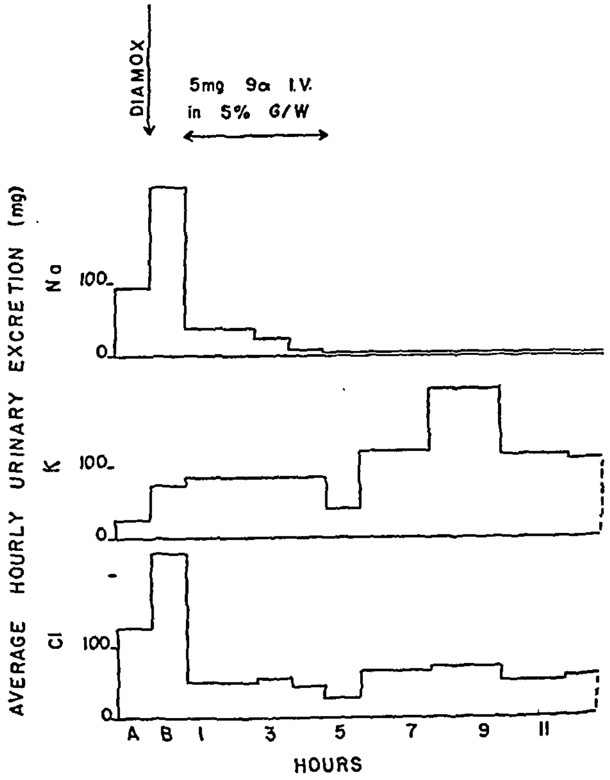

Fig. 5.—Urinary excretion of electrolytes in patient (case 7) showing increased excretion caused by acetazolamide (Diamox) (B) over average hourly excretion of control period (A) and promptly decreased sodium excretion as well as potassium diuresis following fludrocortisone acetate (9-α-fluorohydrocortisone).

for four days, during which time there was an 8 lb. (3.6 kg.) weight loss. She has subsequently been maintained on treatment with fludrocortisone acetate 0.5 mg. every third day and has felt better than on previous maintenance therapy.

Case 8.—A 50-year-old female with adrenal cortical hypofunction for three years had been adequately treated with cortisone 25 mg. daily and desoxycorticosterone pellets that had last been implanted 10 months previously. All medication was discontinued, and a constant 1,000 mg. sodium diet with 2,300 mg. of potassium was started. Within 48 hours, weakness, fatigue, nausea, and hypotension were present. A dose of 5 mg. of fludrocortisone acetate was then given intravenously in 5% glucose in water over four hours, and within four hours the patient had a symptomatic remission and the blood pressure had returned to normal values. Urinary excretion of sodium, potassium, and chloride was obtained before and after therapy and showed almost immediate marked decrease in sodium and chloride excretions as well as increased potassium excretion (fig. 6). Subsequently, 3 mg. was given daily with complete remission. However, within 12 days the patient gained 16 lb. (7.3 kg.), and mild respiratory distress was present. The cardiac diameter as determined by x-ray was increased 2 cm. Medication was stopped, sodium intake was limited, and a mercurial diuretic was given causing an 8 lb. (3.6 kg.) weight loss and relief of symptoms. After four days treatment was restarted with 0.5 mg. every second day on which she has been adequately maintained.

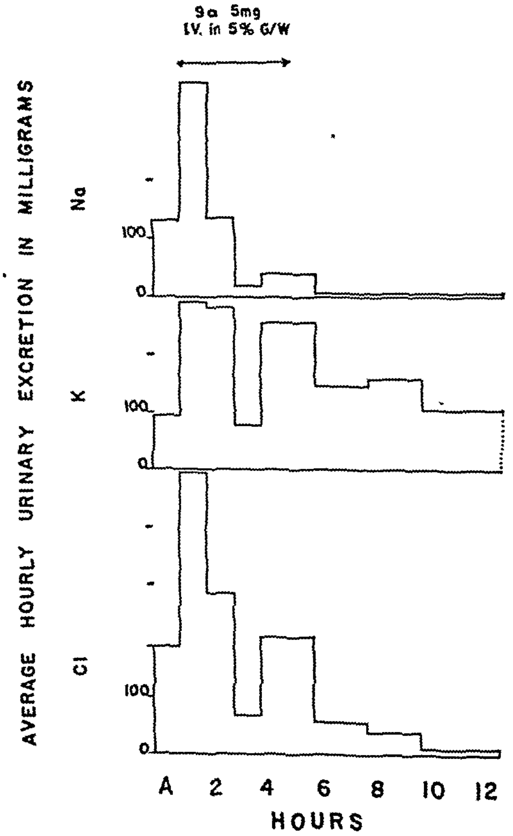

Fig. 6.—Urinary excretion of electrolytes in patient (case 8) showing decreased excretion of sodium and diuresis of potassium following fludrocortisone acetate (9-α-fluorohydrocortisone). Initial increased loss of electrolytes is thought to be due to initiation of the infusion.

In four additional cases of adrenal cortical hypofunction this compound has been successfully used as total replacement therapy. In all four patients medication was withheld until symptoms and signs of mild adrenal insufficiency were observed. Two patients were then given 2 mg., one was given 3 mg., and the other 5 mg. of fludrocortisone acetate intravenously and maintained on from 1 to 4 mg. orally for the first few days. In those cases receiving less than 5 mg. initially, the responses were not as dramatic as with larger amounts even though in two cases salt supplements orally were used. The patients have been successfully managed on 0.5 mg. every second or third day.

Because of its dual effect similar to that of both cortisone and desoxycorticosterone acetate, fludrocortisone acetate has been successfully used as total replacement therapy in six cases of adrenal cortical hypofunction. Marked immediate sodium retention was demonstrated in two cases in which urinary excretion was studied. Prolonged overtreatment produced symptoms of water retention. The average maintenance dose required after stabilization was 0.5 mg. every second to third day.

CONCLUSIONS

Fludrocortisone acetate (9-α-fluorohydrocortisone), evaluated in several clinical conditions in order to compare its effect with cortisone and desoxycorticosterone (Doca) acetate, was shown to have a cortisone-like effect averaging 15 to 20 times as great as hydrocortisone in its ability to: (1) inhibit the pituitary stimulation of the adrenal cortices; (2) produce loss of nitrogen, calcium, and phosphorus; (3) inhibit inflammation; and (4) produce a sense of well-being. Fludrocortisone acetate has an effect on mineral and water metabolism similar to desoxycorticosterone but averaging about five times as great as desoxycorticosterone in its ability to promote sodium, chloride, and water retention and potassium diuresis. Its greatest clinical usefulness will probably be in adrenal insufficiency or adrenal surgery where both desoxycorticosterone and cortisone effects are desirable. Its usefulness in conditions where cortisone or hydrocortisone alone has been beneficial will be limited by excessive sodium and water retention. Since its break-down products in the doses used do not appreciably affect the urinary steroid values, an additional advantage is its use in those cases of acute adrenal insufficiency in which treatment may be necessary before diagnostic studies can be performed.

Anticoagulant Therapy.—Major factors responsible for the misuse of anticoagulants include: (1) self-medication without prothrombin tests; (2) medication under physician's directions but without correct control; (3) administration of anticoagulants in the face of contraindications; (4) withholding of anticoagulant therapy in the presence of definite indications; (5) excessive dosage; and (6) inadequate dosage. Accumulated experience with these drugs has reduced the relative incidence of serious hemorrhage. Serious hemorrhage is rare in mild and moderately ill patients. The availability of vitamin K_1 has increased the safety. New coumarin and phenylindandione derivatives have been introduced for clinical use. . . . Their rate and duration of action vary, but their effectiveness depends fundamentally on their action on prothrombin. . . . The value of these drugs does not appear to be very different, and the facility with which the physician uses them probably constitutes the most important single factor in securing therapeutic results with safety. Heparin remains the only drug of its type suitable for clinical use. The so-called anticoagulants with enzymatic properties are thus far in an experimental phase and are not recommended for general use in man, pending much more comprehensive and critical evaluation.—I. S. Wright, M.D., Present Status of Anticoagulant Therapy in the Treatment of Myocardial Infarction, *Annals of Internal Medicine*, November, 1955.

THE POWERFUL PLACEBO

Henry K. Beecher, M.D., Boston

Placebos have doubtless been used for centuries by wise physicians as well as by quacks, but it is only recently that recognition of an enquiring kind has been given the clinical circumstance where the use of this tool is essential ". . . to distinguish pharmacological effects from the effects of suggestion, and . . . to obtain an unbiased assessment of the result of experiment." It is interesting that Pepper could say as recently as 10 years ago "apparently there has never been a paper published discussing [primarily] the important subject of the placebo." In 1953 Gaddum[1] said:

> Such tablets are sometimes called placebos, but it is better to call them dummies. According to the Shorter Oxford Dictionary the word placebo has been used since 1811 to mean a medicine given more to please than to benefit the patient. Dummy tablets are not particularly noted for the pleasure which they give to their recipients. One meaning of the word dummy is a "counterfeit object." This seems to me the right word to describe a form of treatment which is intended to have no effect and I follow those who use it. A placebo is something which is intended to act through a psychological mechanism. It is an aid to therapeutic suggestion, but the effect which it produces may be either psychological or physical. It may make the patient feel better without any obvious justification, or it may produce actual changes in such things as the gastric secretion. . . . Dummy tablets may, of course, act as placebos, but, if they do, they lose some of their value as dummy tablets. They have two real functions, one of which is to distinguish pharmacological effects from the effects of suggestion, and the other is to obtain an unbiased assessment of the result of experiment.

One may comment on Gaddum's remarks: Both "dummies" and placebos are the same pharmacologically inert substances; i. e., lactose, saline solution, starch. Since they appear to be differentiable chiefly in the reasons for which they are given and only at times distinguishable in terms of their effects, it seems simpler to use the one term, placebo, whose two principal functions are well stated in Professor Gaddum's last sentence quoted above. Finally, I do not understand how a dummy tablet could be prevented from having a psychological effect that, if pleasing, would make it a placebo. One term seems to fill the bill. If it falls a bit short of precision, perhaps the language will have to grow a little to include the new use.

To the increasingly well-recognized uses of the placebo I would add its use as a tool to get at certain fundamental mechanisms of the action of drugs, especially those designed to modify subjective responses. This use will be illustrated here. Strong evidence will be presented to support the view that several classes of drugs have an important part of their action on the reaction or processing component of suffering, as opposed to their effect on the original sensation.

The opportunities opened up by the placebo are unique, for it cannot possibly enter into any process by virtue of its chemical composition. It has, so to speak, neither the reactivity nor the physical dimensions required of an "effective" drug. It does not matter in the least what the placebo is made of or how much is used so long as it is not detected as a placebo by the subject or the observer. Thus the placebo provides an indispensable tool for study of the reaction or processing component of suffering. This will be referred to later on in this paper. I have discussed it extensively elsewhere.[2]

REASONS FOR USE

Reasons for the use of the placebo can be indicated by summarizing, then, its common purposes: as a psychological instrument in the therapy of certain ailments arising out of mental illness, as a resource of the harassed doctor in dealing with the neurotic patient, to determine the true effect of drugs apart from suggestion in experimental work, as a device for eliminating bias not only on the part of the patient but also, when used as an unknown, of the observer, and, finally, as a tool of importance in the study of the mechanisms of drug action. Moreover, as a consequence of the use of placebos, those who react to them in a positive way can be screened out to advantage under some circumstances and the focus sharpened on drug effects. For example, Jellinek (1946) in studying 199 patients with headache found that 79 never got relief from a placebo, whereas 120 did. His data for these numbers can be tabulated as follows: While differences between A, B and C do not emerge in the "mean success rate," it appears in the placebo-nonreactor group that A is definitely more effective than the other agents (table 1). He thus demonstrated (validated with statistical methods) that when the placebo reactors are screened out more useful differentiations can be made than otherwise is the case. Jellinek is not on such sure ground when he seems to dismiss the placebo reactors as those having "imagined pain, psychological headaches." From work on postoperative wound pain done by me and my associates it appears that placebos can relieve pain arising from physiological cause. (Certainly the reverse is true: psychological cause in promoting a flow of gastric juice can produce ulcer pain, etc.) This matter of the place of reaction to unpleasant sensory phenomena has been discussed elsewhere.[2]

We can take an example from our own work where placebos have relieved pain arising from physiological cause (surgical incision) and show how useful the screening out of placebo reactors can be. I, with Keats, Mosteller, and Lasagna,[3] in 1953, administered analgesics by mouth to patients having steady, severe postoperative wound pain, and we found that when we took all patients and all data we could not differentiate between

certain combined acetylsalicylic acid data and narcotic (morphine and codeine) data; however, when we screened out the placebo reactors, a sharp differential emerged in favor of the acetylsalicylic acid administered orally as opposed to the narcotics administered orally. Observations of this kind were enough to give us an interest in the placebo reactor as such. We made a study of him and of the placebo response [4] in 1954 in a group of 162 patients having steady, severe postoperative wound pain. We found that there were no differences in sex ratios or in intelligence between reactors and nonreactors. There are however significant differences in attitudes, habits, educational background, and personality structure between consistent reactors and nonreactors. These have been described in the report of this study.[4] (There was a significantly higher incidence of relief from morphine in the placebo reactors than in the nonreactors.)

Lasagna, Mosteller, von Felsinger, and I [4] found in a study of severe postoperative wound pain that the number of placebo doses was correlated highly with the total number of doses of all kinds. Fifteen patients with one placebo dose showed 53% relief from the placebo; 21 patients with two placebo doses got 40% relief from the placebo; in 15 patients with three placebo doses 40% gave relief; and of 15 patients with four or more placebo doses 15% gave relief. There was a significant correlation between number of doses and percentage relief. This same study gave an opportunity to examine the consistency of the placebo response. Sixty-nine patients received two or more doses of a placebo. Fifty-five per cent (38 patients) of these behaved inconsistently, that is to say, sometimes the placebo produced relief and sometimes not. Fourteen per cent (10 patients) were consistent reactors, that is, all placebo doses were effective. Thirty-one per cent (21 patients) were consistent nonreactors; the placebo doses were never effective. It is impossible to predict the efficacy of subsequent placebos from the response to the initial dose of saline. It must not be supposed that the action of placebos is limited to "psychological" responses. Many examples could be given of "physiological" change, objective change, produced by placebos. Data on this will be presented below.

MAGNITUDE OF THE THERAPEUTIC EFFECT OF PLACEBOS

Notwithstanding the keen interest of a number of individuals in placebo reactors and the placebo response, there is too little scientific as well as clinical appreciation of how important unawareness of these placebo effects can be and how devastating to experimental studies as well as to sound clinical judgment lack of attention to them can be. This problem exists in many laboratories and in many fields of therapy. Its size and pervasiveness can best be illustrated by quantitative data from the studies of others as well as our own. Fifteen illustrative studies have been chosen at random (doubtless many more could have been included) and are shown in table 2. These are not a selected group: all studies examined that presented adequate data have been included. Thus in 15 studies (7 of our own, 8 of others) involving 1,082 patients, placebos are found to have an average significant effectiveness of 35.2±2.2%, a degree not widely recognized. The great power of placebos provides one of the strongest supports for the view that drugs that are capable of altering subjective responses and symptoms and do so to an important degree through their effect on the reaction component of suffering.[2]

TOXIC AND OTHER SUBJECTIVE SIDE-EFFECTS OF PLACEBOS

Not only do placebos produce beneficial results, but like other therapeutic agents they have associated toxic effects. In a consideration of 35 different toxic effects of placebos that we had observed in one or more of our studies, there is a sizable incidence of effect attributable to the placebo as follows: dry mouth, 7 subjects out of 77, or 9%; nausea, 9 subjects out of 92, or 10%; sensation of heaviness, 14 subjects out of 77, or 18%; headache, 23 subjects out of 92, or 25%; difficulty concentrating, 14 subjects out of 92, or 15%; drowsiness, 36 subjects out of 72, or 50%; warm glow, 6 subjects out of 77, or 8%; relaxation, 5 subjects out of 57, or 9%; fatigue, 10 subjects out of 57, or 18%; sleep, 7 subjects out of 72, or 10%. The effects mentioned were recorded as definite but without the subject's or observer's knowledge that only a placebo had been administered.

Wolf and Pinsky [5] reported in 1954 on an interesting study of placebos and their associated toxic reactions. They found, in studying a supposedly effective drug and a placebo (lactose) in patients with anxiety and tension as prominent complaints, that these symptoms were made better in about 30% of 31 patients. It is interesting to observe that the improvement rate was greater on the subjective side as just given than it was when objective signs of anxiety such as tremulousness, sweating, and tachycardia were considered. In this case (objective signs) about 17% were made better.

In these patients of Wolf and Pinsky there were various minor complaints, but 3 of the 31 patients had major reactions to the placebo: one promptly had overwhelming weakness, palpitation, and nausea both after taking the placebo and also after the tested (therapeutically ineffective) drug. A diffuse rash—itchy, erythematous, and maculopapular—developed in a second patient after the placebo. It was diagnosed by a skin consultant as dermatitis medicamentosa. The rash quickly cleared after the placebo administration was stopped. Since the

placebo was a small quantity of lactose taken orally, it is hardly possible that it could have produced a real dermatitis. In a third patient, within 10 minutes after taking her pills, epigastric pain followed by watery diarrhea, urticaria, and angioneurotic edema of the lips developed. These signs and symptoms occurred twice more after she received the pills and again when the batch of pills was shifted; thus she had the reaction after both the (therapeutically ineffective) drug as well as after the placebo. These powerful placebo effects are objective evidence that the reaction phase [2] of suffering can produce gross physical change.

OBJECTIVE EFFECTS OF PLACEBOS

Abbot, Mack, and Wolf [6] found in 13 experiments with placebos on a subject with a gastric fistula that the gastric acid level decreased in eight experiments, increased in two, and was unchanged in three. Whereas, in a second group of 13 experiments with no agent used, the gastric acid level increased in one case, decreased in 4, and remained the same in 8. The gastric acid level fell apparently about twice as often when a placebo was used as when no agent was administered. In the section above on toxic effects, reference was made to the patients of Wolf and Pinsky [5] who developed objective toxic signs following placebo administration: palpitation, erythematous rash, watery diarrhea, urticaria, angioneurotic edema. Wolf [7] has pointed out ". . . 'placebo effects' include objective changes at the end organ which may exceed those attributable to potent pharmacologic action."

During work with narcotics, Keats and I observed that 7 subjects out of 15, or 47%, were recorded as having constricted pupils, believed at the time (using "unknowns" technique) to be a drug effect, although later it was found that a placebo had been used. Even though this observed effect possibly might not have been related to the placebo administration in this case, it illustrates the kind of error that can get into uncontrolled drug experiments.

Cleghorn, Graham, Campbell, Rublee, Elliott, and Saffran studied the adrenal cortex in psychoneurotic patients where anxiety requiring hospitalization was the most prominent feature. They found that a placebo (isotonic sodium chloride) injection produced a response in patients with severe anxiety similar to that given by corticotropin (ACTH) in normal patients. (As criteria of adrenal cortical activity they used the following indexes: increase in circulating neutrophils, decrease in lymphocytes, decrease in eosinophils, increase in the ratio of uric acid to creatinine. And more recently they

have added: potassium, sodium, 17-ketosteroids, and neutral reducing lipids determinations.) The amount of change was recorded in several types of experiments on normals (labeled O) as well as on patients. The patients have been divided arbitrarily into three categories, mild effect (labeled ½), moderate (labeled 1), marked (labeled 2) and the numerical range limits for these groups set down. The label numbers in a given case were added together to give a composite index of adrenal cortical activity. Normal subjects who received a small dose of corticotropin always reacted more than the ½ class; class 1 was the range of change never observed in normal controls but was common in stress and with corticotropin; class 2 presented a degree of change that was unusual for doses of corticotropin not exceeding 25 units. The response increased with the dose of corticotropin. Twenty-five of the subjects received a saline placebo injection. From the data it is evident that the patients with the severest anxiety states have a greater disturbance of their adrenal cortical activity by the placebo than is true of patients with less anxiety.

These objective changes show that placebos can set off the adrenals and mimic drug action. They also show that the severer the disease state the greater is their effect. (This is in line with our long-standing thesis that, for sound information concerning the effectiveness of certain drugs designed to alter subjective responses ordinarily arising in disease, it is sounder than otherwise to go to the pathological situation for answers as to drug effectiveness.)

In work in progress I have found strong evidence that placebos are far more effective in relieving a stressful situation (early postoperative wound pain) when the stress is severe than when it is less so. Thus subjective and objective (Cleghorn and others) data both support the view of a differential effectiveness of placebos.

COMMENT

An interesting discussion of the use of the placebo in therapy was presented by Gold and others in one of the Cornell Conferences on Therapy in 1946.[8] Gold was one of the very earliest investigators to understand the use and significance and importance of the placebo. Not enough attention has been given to his sensible comments over the years. At this particular conference, DuBois commented that, although scarcely mentioned in the literature, placebos are more used than any other class of drugs. He objected to the definition of a placebo as an agent designed to pacify rather than to benefit and held, reasonably enough, that to pacify is to benefit. DuBois recalled that Fantus claimed that the lower the intelligence of the patient the more he is benefited by a placebo. Gold strongly disagreed and provided support for his disagreement. We agree with Gold on the basis of our own evidence.[4] Wolff pointed out that the placebo as a symbol of the doctor says in effect "I will take care of you." Diethelm suggested that the person reacts to suggestion because what is suggested becomes to him reality. He believes it and consequently the expected result occurs. (In believing, the expected reaction takes place.) Gold made a strong plea for "pure" placebos; i. e., placebos that do not contain any element that could conceivably have a direct effect on the body's cells, otherwise the physician is likely to deceive himself. He comes to believe that these unlikely agents are nevertheless, by virtue of the specific drug included, effective, when really all the power they have is as a placebo.

In studies of severe, steady postoperative wound pain extending over a considerable number of years we have found that rather constantly 30% or more of these individuals get satisfactory pain relief from a placebo. The effectiveness of a placebo does vary in this work as shown in table 2, from one group to another, but is always at an impressively high level, generally above the 30% mentioned. Certainly in these and the other studies shown in table 2 the validity of the thesis presented here (namely, that the placebo can have powerful therapeutic effect) hinges largely on the definition of "satisfactory relief." In each study referred to this has been carefully defined. For example, in our pain work satisfactory relief is defined as "50 per cent or more relief of pain" at two checked intervals, 45 and 90 minutes after administration of the agent. (This is a reproducible judgment patients find easy to make.) Each author has been explicit, and some have required even greater success than indicated above. For example, Gay and Carliner (1949) required, for a positive effect, complete relief of seasickness within 30 minutes of administration of the placebo. The important point here is that in each of these representative studies, patients and observers alike, working with unknowns (usually "double blind" technique) have concluded that a real therapeutic effect has occurred. The implication of this for an uncontrolled study is clear.

The constancy of the placebo effect (35.2 ± 2.2%) as indicated by the small standard error of the mean in a fairly wide variety of conditions, including pain, nausea, and mood changes, suggests that a fundamental mechanism in common is operating in these several cases, one that surely deserves further study.

With placebos having an average high effectiveness of 35% (table 2) in the variety of conditions dealt with here, it should be apparent that "clinical impression" is hardly a dependable source of information without the essential safeguards of the double unknowns technique, the use of placebos also as unknowns, randomization of administration, the use of correlated data (all agents are studied in the same patients), and mathematical validation of any supposed differences. These safeguards are essential when matters of judgment enter into decision. Many "effective" drugs have power only a little greater than that of a placebo. To separate out even fairly great true effects above those of a placebo is manifestly difficult to impossible on the basis of clinical impression. Many a drug has been extolled on the basis of clinical impression when the only power it had was that of a placebo.

Not only does the use (and study) of placebos offer much of practical value, but it is important to recognize that use of this tool promises to give access to an understanding of certain basic problems of mechanism of action of narcotics and other agents that modify subjective responses. A detailed discussion has been given elsewhere [2] *of the two phases of suffering: the original pain* sensation, for example, and then the reaction to it or the processing of it by the central nervous system. The evidence for the importance of the reaction phase as the site of drug action has been assembled,[2] and in that account the effectiveness of placebos stands as one of the principal supports of the concept. We can learn still more from placebos along this line. Consider the following statement: If, against all of the evidence to the contrary, one were to hold the view that the placebo is a feeble or useless therapeutic agent, then the placebo should appear most effective when the test condition is mild and less effective when pitted against severe conditions. There are two kinds of evidence, subjective and objective, referred to above, that just the opposite is the case: placebos are most effective when the stress (anxiety or pain, for example) is greatest.

---

[8] Wolff, H. G.; DuBois, E. F., and Gold, H., in Cornell Conferences on Therapy: Use of Placebos in Therapy, New York J. Med. 46: 1718-1727, 1946.

Two other views fit well with these findings. For some years we have held to the working hypothesis that subjective responses must be studied in man where they arise in pathology, that they cannot be usefully contrived experimentally in man. There is considerable factual evidence to support this view.[2] We believe the reason for this is that in pathology the significance, the reaction, is greatest and of a kind and degree that cannot adequately be produced experimentally. Where the significance is greatest, one can expect the greatest reaction, the greatest (more extensive) processing of the original sensations, and, in a parallel way, the greatest response to therapy both of "active" drugs (like morphine) and of placebos insofar as they act on the reaction phase. This may explain why morphine fails to block the experimental pain of the Hardy-Wolff procedures.[2] The greater effectiveness of the placebo where the stress and reaction are greatest, taking into account that the placebo can only act on the reaction facet, supports the view that placebos being chiefly effective as indicated when there is great significance, great reaction, do indeed act by altering the reaction.

Placebos provide an opportunity for attacking problems not possible of study with specifically effective drugs (like morphine on pain), since with these drugs one can never be sure that the original sensation was not altered by drug action. The placebo effect of active drugs is masked by their active effects. The power attributed to morphine is then presumably a placebo effect plus its drug effect. The total "drug" effect is equal to its "active" effect plus its placebo effect: 75% of a group in severe postoperative pain are satisfactorily relieved by a large dose of morphine (15 mg. of the salt per 70 kg. of body weight), but 35% are relieved by the placebo.

SUMMARY AND CONCLUSIONS

It is evident that placebos have a high degree of therapeutic effectiveness in treating subjective responses, decided improvement, interpreted under the unknowns technique as a real therapeutic effect, being produced in 35.2 ± 2.2% of cases. This is shown in over 1,000 patients in 15 studies covering a wide variety of areas: wound pain, the pain of angina pectoris, headache, nausea, phenomena related to cough and to drug-induced mood changes, anxiety and tension, and finally the common cold, a wide spread of human ailments where subjective factors enter. The relative constancy of the placebo effect over a fairly wide assortment of subjective responses suggests that a fundamental mechanism in common is operating, one that deserves more study. The evidence is that placebos are most effective when the stress is greatest. This supports the concept of the reaction phase as an important site of drug action.

Placebos have not only remarkable therapeutic power but also toxic effects. These are both subjective and objective. The reaction (psychological) component of suffering has power to produce gross physical change. It is plain not only that therapeutic power of a drug under study must in most cases be hedged about by the controls described below but also that studies of side-effects must be subjected to the same controls.

When subjective responses, symptoms, are under study, it is apparent that the high order of effectiveness of placebos must be recognized. Clearly, arbitrary criteria of effectiveness of a drug must be set up. Preservation of sound judgment both in the laboratory and in the clinic requires the use of the "double blind" technique, where neither the subject nor the observer is aware of what agent was used or indeed when it was used. This latter requirement is made possible by the insertion of a placebo, also as an unknown, into the plan of study. A standard of reference should be employed for comparison with new agents or techniques. Randomization of administration of the agents tested is important. The use of correlated data (the agents compared are tested in the same patients) is essential if modest numbers are to be worked with. Mathematical validation of observed difference is often necessary. Whenever judgment is a component of appraisal of a drug or a technique, and this is often the case, conscious or unconscious bias must be eliminated by the procedures just mentioned. These requirements have been discussed in detail elsewhere.[9]

[9] Beecher, H. K.: Appraisal of Drugs Intended to Alter Subjective Responses, Symptoms, report to Council on Pharmacy and Chemistry, J. A. M. A. : 399-401 (June 4) 1955.

Machine Age Overtakes Medicine.—As year succeeds year, some new physical or chemical technic and some new and elaborate machine are applied to the study of disease; great claims are always made for the precision of the answers yielded by these technics and machines. One of the greatest struggles that a practicing doctor has is to keep up-to-date with advances of this kind. No sooner has he mastered one than another is upon him. Moreover, the machines or technics are often so complex that he cannot understand them. He has to take what they tell him on trust. . . . There is a growing tendency for doctors to rely on the information given by such technics and machines in preference to the information which they gain themselves from the history and physical signs. I am extremely doubtful if this is in the interests of good doctoring, and for three reasons. First, the errors and limitations of these new technics are not at first appreciated. . . . Second, a thorough clinical examination, which will be carried out only by doctors who appreciate its worth, is the best method of establishing that spirit of mutual understanding and good will which is the core of the doctor-pationt relationship. Finally, to rely on data, the nature of which one does not understand, is the first step in losing intellectual honesty. The doctor is particularly vulnerable to a loss of this kind, since so much of therapeutics is based on suggestion. And the loss naturally leaves him and his patients the poorer.—G. W. Pickering, M.D., Disorders of Contemporary Society and Their Impact on Medicine, *Annals of Internal Medicine*, November, 1955.

ROLE OF PEDIATRICIAN AND HOSPITAL IN CARE OF ORTHOPEDICALLY HANDICAPPED CHILD

Helen M. Wallace, M.D., Robert S. Siffert, M.D.
and
Jerome S. Tobis, M.D., New York

Medical progress of the past few decades has drastically changed the scope of many specialties, including pediatrics. With the conquest of infectious and nutritional diseases the major problems of child health remain in the fields of health supervision, chronic illness, and "mental health." The field of chronic illness is a broad one including musculoskeletal disabilities, rheumatic fever and heart disease, hearing and speech, convulsive disorders, congenital malformation of all types, visual defects, mental retardation, and emotional disturbance. The pediatrician's potential contribution to the care of these youngsters is unlimited. In urban areas it is usually the pediatrician who sees many of these children in the hospital newborn infant nurseries. From then on he shares with the family the responsibility for the child's development in health and disease. In view of the huge potential role that the pediatrician might play in the care of children with chronic illness, it is surprising how little he does participate. This report describes the functioning of the pediatrician in the hospital care of orthopedically handicapped children in a large urban area. It raises the question as to why his role has been a minor one and suggests means by which this all important component of handicapped children's care can be greatly strengthened.

BACKGROUND

The Bureau for Handicapped Children of the New York City Department of Health (through the state-aid Medical Rehabilitation Program) since 1945 has provided payment for hospital, convalescent, and rehabilitation care for handicapped children under the age of 21 years. Approximately $1,500,000 was expended from July 1, 1953, to July 1, 1954, for the care of orthopedic, congenital cardiac, visual, cleft palate, drug addiction, orthodontic, plastic surgical, and certain pediatric conditions. Since 1951, the bureau has attempted to evaluate the quality of care given to the children under the program and to work with the participating institutions toward the improvement of such care. The Hospital Consultation Program of the bureau has functioned through a periodic survey of hospital and convalescent services. In the orthopedic field, surveys of 25 children's hospital orthopedic services have been made by a team composed of an orthopedic surgeon, physiatrist, pediatrician, hospital nursing consultant, and medical social worker. Survey findings have been presented to the Orthopedic Advisory Committee composed of 15 leaders in the fields of orthopedic surgery, physiatry, pediatrics, nursing, social work, hospital administration, and vocational rehabilitation. Based on standards developed by the advisory committee, letters of recommendations have been sent to the corresponding key members of the staff of each hospital and a postsurvey conference has been held at the hospital with the same key personnel to discuss the findings and recommendations. The following data represent the pertinent pediatric findings noted as the results of the survey of 25 children's hospital orthopedic services. Of the 25 hospitals, 15 are general hospitals, 6 are specialty hospitals devoted predominantly or exclusively to the care of orthopedic patients, 2 are chronic disease hospitals, and 2 are communicable disease hospitals.

SURVEY FINDINGS

Approval for Residency Training.—Of the 25 hospitals, 15 general hospitals (60%) have full approval by the Council on Medical Education and Hospitals of the American Medical Association for training in pediatrics, and 2 communicable disease hospitals (8%) are approved for a six month period only. Eight hospitals (32%) are not approved; this group is composed of six specialty hospitals and two general hospitals. The important finding is that 68% of the hospitals have some degree of approval for pediatric residency training, and the potential opportunity for pediatric participation in the care of these children is considerable. In the orthopedic surgical field, 17 of the 25 hospitals (68%) have some degree of approval for orthopedic training, of which 12 hospitals (48%) have full three year approval. In the field of physical medicine and rehabilitation, 8 of the 25 hospitals (32%) have approval for the training of residents in physiatry (table 1).

Provision of Qualified Chiefs of Services.—Only 8 (32%) of the 25 hospitals had qualified chiefs of the orthopedic, pediatric, and physical medicine and rehabilitation services who were actively supervising the services. Of the 25 hospitals, 12 had qualified chiefs of orthopedic and pediatric services; 2 had qualified chiefs of orthopedic and physical medicine and rehabilitation services; one had chiefs in pediatric and physical medicine and rehabilitation services; one had a chief in pediatrics only; and one had a chief in physical medicine and rehabilitation only. The opportunity for pediatric participation is again demonstrated by the fact that 22 of the 25 hospitals (88%) had a qualified pediatrician in charge of the pediatric care. Twenty-two hospitals (88%) had a qualified orthopedic surgeon in charge of the orthopedic care. Twelve hospitals (48%) had a qualified physiatrist in charge of the physical medicine and rehabilitation care.

Provision of Resident Staff.—Only 4 of the 25 hospitals (16%) had available resident staff from the three essential services of orthopedic surgery, pediatrics, and physical medicine and rehabilitation; 5 had residents in orthopedics and pediatrics; one had residents in orthopedics and physical medicine and rehabilitation; 3 had

---

From the Bureau for Handicapped Children, New York City Department of Health.

Read before the Section on Pediatrics at the 104th Annual Meeting of the American Medical Association, Atlantic City, June 8, 1955.

residents in orthopedics only; 6 in pediatrics only; one in physical medicine and rehabilitation only; 2 in general surgery and pediatrics; 2 in general surgery only; and one had none. Thus, 17 hospitals (68%) had pediatric residents, 13 (52%) had orthopedic residents, and 6 (24%) had residents in physical medicine and rehabilitation. The pediatric specialty had the greatest frequency of resident staff available for the care of these children.

Census.—At the time of the survey, 3 of the 25 hospitals had no orthopedic patients in the age group from birth to 21 years, 7 had 1 to 5, 2 had 6 to 10, 2 had 11 to 15, one had 16 to 20, one had 21 to 25, 3 had 26 to 30, 2 had 31 to 40, 2 had 41 to 50, one had 51 to 60, and one had over 60. A total of 12 hospitals had 10 or less and 15 hospitals had 20 or less. These surveys were usually made during the period from September through June. Usually no surveys are made during July and August due to the vacation of the hospital staffs. This finding of low patient census in many hospitals is a significant one, which will be discussed later.

Admission Procedure.—In no hospital did all three essential team members, namely the orthopedic, pediatric, and physical medicine and rehabilitation residents see the children together or separately on admission to the inpatient service. The predominant pattern, found in nine hospitals, was for the orthopedic resident alone to see the child; in five hospitals they were seen by the surgical resident only, in four by the orthopedic and pediatric residents, in two by the pediatric resident only, in two the younger children (to age 2) by the pediatric resident and the older ones by the surgical resident, in one by the orthopedic and pediatric (part-time) coordinators, in one by the surgical and pediatric residents, and in one by the physiatrist, psychologist, social worker, nurse, and physical and occupational therapists. Thus the pediatric resident participated in the admission evaluation of all children in seven hospitals. In only one hospital was there use of the nonmedical members of the team in the admission evaluation of children; in this instance neither the pediatrician nor the orthopedist participated in the admission evaluation.

Extent of Medical Supervision.—The extent of medical supervision can be seen in the frequency and pattern of rounds and in the frequency of and attendance at staff conferences.

Frequency of Medical Rounds: Of the 25 hospitals surveyed, daily rounds were made by orthopedists in 12, by pediatricians in 7, and by physiatrists in 2; in 21 hospitals there was a regular plan for orthopedic supervision; in only 12 was there a regular plan for pediatric supervision; in 7 other hospitals the pediatric staff was used on a consultation basis but was rarely called in for consultation. In only five hospitals was there a regular plan for supervision by the physical medicine and rehabilitation staff (table 2).

Pattern of Medical Rounds: The predominant pattern found was for the orthopedic medical staff to make rounds alone (15 hospitals); in 2 hospitals rounds were made jointly by orthopedists, pediatricians, social service workers, and nurses; in 2 by physiatrists, pediatricians, nurses, and physical therapists; in one by orthopedists and social service workers; in one by orthopedists, social service workers, and nurses; in one by orthopedists and nurses; in one by the pediatric staff alone; in one by the physiatric staff alone; and in one by a team comprised of orthopedist, physiatrist, social worker, nurse, and physical therapist. In five hospitals, the pediatricians attended or participated in rounds either separately or with other members of the medical or nonmedical team. In no hospital did all members of the medical team of the pediatrician, the orthopedist, and the physiatrist make rounds together.

Frequency of Staff Conferences: Weekly orthopedic staff conferences were held in 17 hospitals, 3 hospitals held them once a month, and 5 hospitals either had no staff conferences or held them at infrequent or sporadic intervals. (One held them quarterly, one held them occasionally, and 3 had none.)

Orthopedic, nursing, social service, physical and occupational therapy	1
Physiatric; pediatrician; nursing; social service; psychologist; physical, occupational, and speech therapists; teacher	1
Physiatric, physical therapist	1
None	3
Total	25

Attendance at Staff Conferences: The predominant pattern was for the orthopedic staff to hold their conferences alone (12 hospitals). In no hospital was there a plan for a regular joint conference of the three essential medical services. In only three hospitals did a member of the pediatric staff attend and participate in orthopedic staff conferences (table 3).

Essential Ancillary Personnel and Services.—Thirteen hospitals had a nursing supervisor assigned to the service caring for orthopedically handicapped children. Of these, there were two had nursing supervisors with special training in orthopedic nursing and two with special training in pediatric nursing. Only four hospitals had a policy for usually referring orthopedically handicapped children at the time of discharge to the community public health nursing agencies for home follow-up and supervision. Fifteen hospitals had an organized department of physical medicine and rehabilitation, 7 of which had a separate rehabilitation ward provided and 8 of which provided a separate rehabilitation outpatient department. Twenty-two hospitals had at least one full-time physical therapist on the staff. Only three hospitals employed only qualified physical therapists. Thirteen hospitals had at least one full-time occupational therapist, and 10 hospitals had at least one full-time speech therapist. Fourteen of the 25 hospitals had a qualified director of the nutrition or dietetic department. All but two hospitals had a laboratory service for routine laboratory work, and a qualified medical director of the laboratory service. Fourteen of the 25 hospitals had a blood bank. All but two hospitals had a radiology department, and a qualified radiologist in charge of the department. Fifteen of the 25 hospitals are approved by the Council on Medical Education and Hospitals for residency training in radiology.

Fifteen of the 25 hospitals had a qualified medical anesthetist as director of the anesthesia department, and 11 hospitals had an approved residency training program in anesthesiology. In only eight hospitals was anesthesia administered to orthopedically handicapped children routinely by qualified medical anesthetists. Fourteen of the 25 hospitals had a qualified director of the social service department. Four hospitals had no social service department at all. In only three hospitals was there total social service review and coverage of all orthopedically handicapped children admitted to the inpatient service. In at least nine hospitals, social service data were not incorporated into the patient's individual chart or record. Eighteen hospitals had a teacher provided for continuing the education of the children during the period of hospitalization. Seventeen hospitals had at least one full-time psychologist on the staff. Only four hospitals had a recreation worker on the staff. Only three hospitals had a vocational counselor on the staff. Eight other hospitals had some plan established for referral of teen-age orthopedically handicapped patients to the community vocational guidance agencies. Fourteen hospitals had no such staff or plan. In regard to dental care, 14 hospitals had a service that did extractions only; one additional hospital performed fillings and extractions and one additional hospital had a more complete service including orthodontia care.

Visiting Hours.—All hospitals, where the information was collected, had designated visiting hours at least once a week. Only six hospitals allowed parents to visit daily; three allowed visits four times weekly, five allowed visits three times weekly, six allowed them twice weekly, and two allowed them once a week.

Records.—Of the 22 hospitals with an orthopedic outpatient service, 6 had a unit system of records whereby some continuity of care was provided by incorporation of outpatient records and inpatient charts into a single record. A review of inpatient records in the hospitals revealed in most instances that there was no pediatric admission examination. Pediatric progress notes were in general either absent or brief. In addition to the sparse pediatric notes, other areas of recording requiring strengthening were general progress notes, recording of preoperative surgical evaluation, description of the surgical procedures, physiatric and physical therapy progress notes, social service information, discharge notes, and plan for ongoing supervision.

Outpatient Care.—By the nature of the specialty, most orthopedically handicapped children are treated on an outpatient care basis and only a small percentage require hospitalization. The outpatient department therefore provides the device for early case finding, for making an accurate evaluation and diagnosis, for school placement recommendations, and for providing much of the treatment, supervision, and rehabilitation. Of the 22 hospitals with an outpatient department, only 7 provided a separate children's orthopedic clinic and only 3 had a pediatrician in attendance. There was an extreme variation in the physician-patient ratio in the orthopedic clinics (table 4). No hospital orthopedic clinic had a "time" appointment system for its patients, meaning long periods of waiting for mothers and children. Five clinics had a plan for review and follow-up of broken appointments. There were no regular staff conferences in any of the clinics. Although casts were usually changed during the regular clinic hours, in some instances patients were scheduled for revisits on "special cast days."

COMMENT

From the viewpoint of the pediatrician, the single outstanding finding in the survey material is the fact that such a relatively high percentage of the hospitals are approved for pediatric residency training, have a pediatric resident staff, and have a qualified pediatrician as chief of the pediatric staff; yet there has been so little pediatric participation in the orthopedic care of these children either in the inpatient or the outpatient service. The reasons for the lack of pediatric participation vary from hospital to hospital. Generally there seems to be a lack of appreciation of the contribution that the pediatrician is able to make in the care of these children and some lack of interest on the part of the pediatric staff. The probable reason for this is the fact that many pediatricians during their period of postgraduate training did not have an opportunity to participate in the care of orthopedically handicapped children. At postsurvey conferences with the staffs of the hospitals, many pediatricians have been most receptive to the suggestion that they play a more active role. Not only is the participation of the pediatric staff important from the viewpoint of the actual contribution that the pediatrician is able to make, but since most of the hospitals are approved for pediatric residency training, opportunity should be provided for the house staff members to become trained in the field of orthopedics and learn the meaning of "team care" of an orthopedically handicapped child. With the steadily increasing number of children being treated at home or on outpatient basis there is a critical need for concomitant improvement and expansion of outpatient facilities. Although frequently the major problem, the orthopedic medical component in reality represents but one of the features in the over-all care of the child on an outpatient basis. The clinic not only must serve as the link between hospital and home care but must provide for early case finding and accurate diagnosis and evaluation and plan for long-term medical, social service, and nursing care in chronic illness. Consultation with the pediatrician when indicated, or original referral and clearance from a separate pediatric clinic, as is the current practice, is wholly unsatisfactory as a means of rendering good continuous over-all care to a handicapped child and neglects completely the team approach to common problems. Since the outpatient department closely represents the type of patient seen in daily practice, it is valuable training for a pediatric resident in early recognition of orthopedic abnormalities.

In general there has been a low census of orthopedically handicapped children in hospitals surveyed. In the past several decades there has been a steady decline in orthopedic disabilities associated with rickets and tuberculosis of bones and joints due to general improvement in child health supervision and to public health measures and a decrease in disability due to osteomyelitis since the advent of antibiotics. Nevertheless, hospital inpatient facilities in a large urban area have not been readjusted to the changing clinical picture. From the viewpoint of improved comprehensive care and resident training, the low census in many of the inpatient services raises the question as to whether it might be more desirable to approve fewer services of better quality, with a regional or geographical plan for rotating house staff members of the various specialties.

In general, visiting hours for hospitalized children are too sharply limited. It is felt that liberalization of hours would reduce the untoward psychological effects of separation from the family, serve as a means for parent teaching and interpretation of the child's needs, and assist in certain essential activities such as feeding. Recognizing the administrative objections, which in most instances are soluble, the advantages of liberalized visiting hours appear obvious.

SUMMARY AND CONCLUSIONS

Three basic medical specialties are essential to the care and rehabilitation of orthopedically handicapped children—the orthopedic surgeon, the pediatrician and the physiatrist. They should participate on a "team" basis, so that they see the child on admission, follow the child during the inpatient hospital course, make joint rounds, attend joint conferences, and plan for the child's discharge and ongoing care. Provision should likewise be made for their joint participation in outpatient care. Although the phrase "the team approach" has become a cliché, the concept rarely has been applied. In addition to the physicians, the essential nonmedical members of the team should be included—the social worker, hospital and public nurses, the psychologist, the physical and occupational and speech therapists, the recreation worker, the nutritionist, the vocational counselor, and the teacher. The skills of many professional disciplines are necessary for the total evaluation, care, and rehabilitation of these children.

A review of the pediatrician's role in the care of orthopedically handicapped children, based on team survey of 25 children's hospital orthopedic services in New York City, indicates that there has been surprisingly little pediatric participation. In both hospital and outpatient care the pediatrician should participate in the medical care of the child and he is often the closest link with the family. He is the most responsible individual in the area of early case finding and early recognition of orthopedic disability, which so often determine whether a child will grow into a healthy normal or a deformed adult.

The Medical Student in Ancient Greece.—In contrast to the magical and rigidly traditional world of Assyrian medicine, and the more rational but hardly less rigid Egyptian cult, the medicine of ancient Greece, whose flower is preserved for us in the Hippocratic writings, seems like a breath of fresh air or a flooding of sunshine into a dank and sinister cave, for though the priests of the temples of Asklepios jealously guarded the belief in divine revelation as a guide to medical treatment, yet they were content to maintain the closest and most friendly relations with the true doctors, the Asklepiadae whose medical schools were established in close proximity to the temples which they regularly frequented and where they studied the illnesses and cures of patients treated there for all kinds of diseases. Medical teaching in these schools of the Asklepiadae—which resembled modern academies rather than universities—began at an early age and in the common case of a doctor's son was naturally initiated by the father. It was continued by practical training from other doctors to whom an honorarium was payable and the pupil when qualified was bound to teach the healing art to the sons of his teacher without remuneration (Puschmann, 1891). The oath which the student eventually took on admission to the Society of the Asklepiadae is preserved in the later Hippocratic collection and represents a far higher ethical code for the regulation of the doctor's life and practice than the world had known previously. The picture it paints of the relations between teacher and student is one that any teacher to-day might envy, as the budding doctor swore "To regard my teacher in this art as equal to my parents." It is obvious from this oath and from what we know of the way of life in Hippocratic and post-Hippocratic times that the medical student must have lived a far healthier life than in most other ages and countries, and a much more interesting one as Greek medicine, like all Greek learning, derived its glory from the impulse of intense curiosity which alone can further the advancement of scientific research. —Sir Weldon Dalrymple-Champneys, Bt., D.M., F.R.C.P., The Medical Student Through the Ages, *Proceedings of the Royal Society of Medicine*, October, 1955.

CLINICAL EVALUATION OF LENTE INSULIN IN ONE HUNDRED NINE DIABETIC PATIENTS

Edgar A. Haunz, M.D., Grand Forks, N. D.

The first significant advance in insulin modifications since the introduction of isophane (NPH) insulin, a crystalline modification of protamine zinc insulin, was the development of so-called insulin-zinc suspensions by Hallas-Møller and co-workers of the Novo Laboratories, Copenhagen, in 1952.[1] Indeed, the rather startling revelation that zinc alone is capable of extending the time-action curve of insulin had eluded competent investigators for many years, simply because it was not fully realized that such delayed action is actually a fourfold function of a suitable buffer (acetate), a critical pH range (pH 5-8), the quantity of zinc present (not less than 0.5 mg. of zinc per 1,000 units of insulin), and the physical state of the insulin (amorphous and crystalline [large or small crystals]).

The commonly used phosphate buffer has been the major deterrent to prolongation of insulin action by zinc alone, even in the presence of large concentrations of zinc. In the presence of a phosphate (or citrate) buffer, the insulin crystals dissolve as the zinc is liberated and the latter is precipitated as zinc phosphate. Previous ignorance of this fact necessitated the use of foreign protein substances such as protamine, histone, and globin to retard the absorption of injected insulin. On the other hand, in the presence of an acetate buffer, insulin crystals apparently permit substances such as zinc to enter into the crystals by diffusion and react chemically with the insulin within its crystal lattice. Summarily, any insulin preparation with a properly adjusted pH, a suitable buffer, and zinc in adequate concentration will contain all the undissolved insulin bound to zinc at the neutral point and be thus capable of prolonged action.

INSULIN-ZINC SUSPENSIONS

Insulin-zinc suspensions exist in two basic physical forms, namely amorphous and crystalline. Amorphous insulin (referring to the physical state of the insulin and not its purity, since crystalline insulin is used in its preparation) is prepared by the precipitation of dissolved crystalline insulin.[2] The amorphous precipitate forms when the pH is adjusted rapidly upward during preparation and the resultant suspension exists in a form more rapidly absorbed, having a time-action potential of about 12 to 18 hours. This preparation is called semilente insulin and contains 2 mg. of zinc per 1,000 units of insulin, with a blood pH of 7.2. The crystalline form, on the other hand, results when insulin crystals are suspended in a solution of a zinc salt and remain undissolved in the pH range of 5-8, provided substances that interact with the zinc are not present.[3] The precipitation zone of pH at which crystallization occurs will vary somewhat with the amount of zinc present.[1] The crystalline form is termed ultralente insulin, a single injection of which may be capable of acting as long as 96 hours.[4]

It is readily apparent that the time action of neither semilente nor ultralente insulin is completely satisfactory; however, the time-action potential can be varied at will simply by admixture of different quantities of these two basic insulin-zinc suspensions. This observation led to the adoption of a mixture ratio considered most ideally suited to control the average diabetic; namely, a mixture of 70% ultralente and 30% semilente insulin. Preliminary observations on this preparation, which is designated lente insulin, or insulin type 70/30, suggest that for practical purposes the time-action curves are superimposable on those of isophane insulin. In fact, conversion from isophane to lente insulin has been made on a unit for unit basis in the studies by Peck and others.[4]

As a general rule the biphasic action curves achieved by "tailor-made" mixtures of protamine zinc insulin and unmodified insulin can be duplicated by similar admixture of amorphous and crystalline insulin-zinc suspensions, but in the latter instance there is the distinct advantage that the two insulins can be premixed several months in advance since the resultant mixture is stable for long periods. While isophane insulin is equally stable and may likewise be premixed, only its fast-acting component can be enhanced. There is no way of prolonging the action of isophane since ordinary protamine zinc insulin cannot be added in situations where this feature is desirable. The advantages of premixed insulins are self-evident.

A number of British investigators have published favorable clinical observations on preliminary trials with insulin-zinc suspensions,[5] and these reports are largely responsible for the commercial availability of these preparations in England, Denmark, and the United States at the present time. In Britain, however, published observations on these trials are in relation to only small groups, ranging from 11 [5a] to 29 [5b] patients, and conclusions to be drawn therefrom are subject to decided limitations. The report of Peck and co-workers [4] represents the largest series at the time of this writing, namely,

---

From the Department of Internal Medicine, Grand Forks Clinic, and the University of North Dakota School of Medicine.

Read at the 15th Annual Meeting of the American Diabetes Association, Atlantic City, June 5, 1955.

The pH studies on mixtures of lente insulin and zinc-insulin crystals were carried out by W. E. Cornatzer, M.D., Ph.D., Professor and Chairman, Department of Biochemistry, University of North Dakota School of Medicine.

The lente insulin used in this study was supplied by Dr. William R. Kirtley, Lilly Research Laboratories, Indianapolis.

60 outpatients and 47 inpatients, but only 29 were selected for detailed analysis. In the latter report the first case of allergy is recorded, refuting the previous impression that allergy does not occur with insulin-zinc suspensions.

In the midst of enthusiasm for the new insulin-zinc suspensions the wisdom of introducing three new preparations has been challenged[6] on the grounds that "dangers resulting from confusion between different preparations will be much increased." However, only two new preparations should prove necessary if it is subsequently shown that unmodified insulin can be mixed with either ultralente or lente insulin. The current impression is that the addition of unmodified insulin, with a pH of 2.9 to 3.5, to either lente or ultralente insulin fails to impart a quick-acting component, because the unmodified insulin is converted into ultralente insulin as a result of the inability of the mixture to be buffered effectively outside the range at which crystalline precipitation occurs. This impression presupposes, of course, that the unmodified insulin used contains neither phosphate nor citrate buffer, the latter of which alone would nullify sustained action by precipitation of the zinc as zinc phosphate or citrate. Before the elimination of amorphous insulin-zinc suspension as a separate preparation can be anticipated, the feasibility of mixing unmodified insulin with either lente or ultralente insulin awaits further elucidation.

The original purpose of Hallas-Møller and co-workers in introducing three new insulin-zinc suspensions consisted of an attempt to fulfill the variable insulin time-action requirements in 65 patients with severe cases of diabetes. The terms A, B, and C reactions were used to designate in a simple way the different blood sugar curves obtained. These curves indicated nothing specific about either the preparation or the patient but expressed exclusively the interaction between the factors involved; namely, the type of diabetes the patient had, his diet, the amount of exercise and sleep he got, and the insulin preparation used.[7] The implications are tantamount to saying that no simple relationship exists between the blood sugar response of a diabetic patient and the activity range of the insulin preparation. The availability of such diversified insulin-zinc suspensions at the present time falls far short of realization since lente insulin is the only commercially available preparation in this country.

PLAN OF STUDY

From a large diabetic practice, a random selection of 109 diabetic patients was made for clinical trial with lente insulin. Patients' ages ranged from 4 to 78 years, 12 of the total being children under 15 years of age. There were 65 female and 44 male patients. The duration of diabetes in these cases ranged from six months to 36 years. To facilitate analysis of results these patients were later classified into five groups on the basis of difficulty in control of the disease, with reference to stability of fasting and postprandial blood sugar values, frequency and severity of hypoglycemic reactions, and degree of cooperation or adequacy of self-management. Such a classification is obviously arbitrary but serves to simplify the statistical analysis of an otherwise unwieldy, heterogenous group of diabetic patients.

The patients in all four groups were on therapy with isophane or other insulin. Group 1 consisted of 66 patients whose control was considered excellent; that is, the fasting and postprandial blood sugar determinations were not unduly high, hypoglycemic reactions were infrequent or absent, and the degree of cooperation and adequacy of self-management was excellent. In this group there were some patients with minimal glycosuria and moderate hyperglycemia, and vice versa (so-called high and low renal threshold diabetic patients). Group 2 consisted of 18 patients whose control was considered only fair to good in terms of hyperglycemia and hypoglycemic reactions despite apparent conscientious adherence to principles of good self-management and diet. Group 3A consisted of 15 patients whose control was obviously poor as evidenced by frequent hyperglycemia, widely fluctuating determinations of fasting and postprandial blood sugar levels, and frequent, moderate to severe insulin reactions, all occurring despite an apparent conscientious adherence to principles of self-management. Group 3B consisted of six patients whose control was generally poor as evidenced by hyperglycemia, in either or both the fasting or postprandial states, and a marked tendency to insulin reactions, both conditions of which were apparently due to deliberate disregard of diet and rules of self-management. Repeated efforts to improve cooperation had failed. Group 4 consisted of four patients who were characterized as metabolically unstable. Their tendency to frequent attacks of hyperglycemia with ketosis, alternating with frequent, severe hypoglycemic reactions was proved, by previous hospitalization under strict conditions of control, not due to gross disregard of rules or diet.

The majority of these patients had been under close clinical observation for several years, and detailed records of daily urinalyses, numerous fasting and postprandial blood sugar determinations, frequency and severity of insulin reactions, and complications were available. The diets prescribed were set up by a trained dietitian. All candidates for trial with lente insulin were required to have several fasting and postprandial blood sugar determinations made before being considered eligible for clinical trials. Several weeks of optimal control with the previous insulin used was a strict prerequisite to acceptance for clinical trial with lente insulin. Tests for sugar in the urine were performed before meals and at bedtime for at least 7 to 10 days before starting a patient on therapy with the new insulin, although in most instances four tests daily had been routine for much longer periods. At the end of this period, fasting and postprandial blood sugar determinations were repeated and therapy with lente insulin started. After 7 to 10 days of therapy with lente insulin, fasting and postprandial blood sugar determinations were again recorded and careful analytic questioning of the patient followed with regard to ease of control, degree of glycosuria evident from four urine tests daily, tendency to insulin reactions, allergy, and whether the patient felt better, worse, or the same with the new insulin. The same data were recorded during each subsequent visit for fasting and postprandial blood sugar determinations. Such follow-up visits were required every two or three weeks (or oftener) during the several months' trial period with lente insulin. Thus, prolonged observation permitted more numerous fasting and postprandial blood sugar determinations, together with a study of such things as the frequency and severity of hypoglycemic reactions and allergic phenomena.

[7] Hallas-Møller, K.; Jersild, M.; Petersen, K., and Schlichtkrull, J.: Zinc Insulin Preparations for Single Daily Injections: Clinical Studies of New Preparations with Prolonged Action, J. A. M. A. 150: 1667-1671 (Dec. 27) 1952.

Each patient accepted was carefully examined to exclude any possible sites of infection or other complications that would invalidate comparative clinical appraisal of the two respective treatment programs. During the course of treatment with lente insulin, 7 (6%) of the total of 109 patients required brief hospitalization ranging from two to seven days for treatment of influenza, upper respiratory infections, or minor injuries, but during such periods the trial data were omitted. This served to prevent confusion in evaluating over-all results.

Every effort was made to maintain uniformity in the conditions under which clinical trials would be made. Thus, no alteration in total calories of the daily diet was permitted when changing from the previous insulin preparation to lente insulin, although minor changes were occasionally necessary in the distribution of calories among feedings. Also, since an appreciable change in weight during either of the two clinical trial periods with insulin therapy would obviously invalidate the comparison of results in a given patient, such cases were omitted. The notorious influence of obesity or weight loss on blood sugar levels and on insulin requirement is too well known to merit emphasis here.

In groups 1 and 2 average fasting and average postprandial blood sugar values were determined during periods of optimal control with lente insulin and with previously used insulins. From 3 to 12 blood sugar determinations were the source of each average value. The same approach was utilized to arrive at average values in groups 3A, 3B, and 4, but, in addition, the over-all range of fasting and postprandial blood sugar values, respectively, was recorded for each patient during periods of optimal control. This was believed statistically significant because of the wide fluctuations in blood sugar levels that were peculiar to these three groups. In all, 2,344 blood sugar determinations were made. Final comparison of results was not made until patients had been taking lente insulin, with or without admixture, for periods ranging from 3 to 10 months. For convenience of recording, insulin reactions were graded on the following basis: grade 1, earliest recognizable signs and symptoms of hypoglycemia; grade 2, definite and moderately severe signs and symptoms of hypoglycemia; grade 3, severe signs and symptoms of hypoglycemia without loss of consciousness; grade 4, extreme signs and symptoms of hypoglycemia progressing to unconsciousness, or "hypoglycemic coma." Each patient was advised to carefully note the time of day when reactions occurred. (Detailed printed record sheets with ample space to record all the above details were provided for each patient.)

During each of the two clinical trial periods glycosuria was expressed as an "average" for each of the four daily tests on the basis of 0 to 4+ sugar as indicated by Clinitest. Samplings were taken during periods of optimal control for two weeks or more on each treatment program. Precise correlation of blood sugar determinations with simultaneous urine tests for sugar on "second voidings" (the specimen to be tested was voided about 15 to 20 minutes after emptying the bladder and drinking a glass of water) served to establish the reliability of urine tests in reflecting interim fluctuations in blood sugar values presumed to occur between actual blood sugar determinations. When the apparent renal threshold was thus determined for each case, urine tests were utilized as ancillary data in evaluating the over-all diabetic control achieved by lente insulin as compared with previously used insulin preparations.

RESULTS

Group 1.—In group 1, 10 of 66 patients exhibited definite improvement in control, 55 were equally well controlled, and one was not quite as well controlled on therapy with lente insulin, as compared with the degree of clinical control with previously used insulins. (Sixty-three patients had previously been taking isophane insulin, two patients had been taking mixtures of protamine zinc and soluble insulin, and the remaining patient had been taking globin zinc insulin.) Improved or equally good control of the blood sugar level was achieved in 57 patients by an equal or slightly lower dose of lente insulin, as evidenced by the grand averages illustrated in figure 1. The remaining nine patients required from 2 to 14 units more lente insulin daily for optimal control.

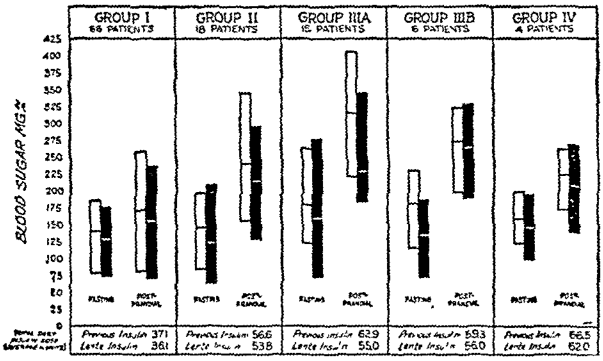

Fig. 1.—Grand average and over-all range of average fasting and postprandial blood sugar values for each group studied. Note that grand averages are consistently lower with patients on therapy with lente insulin than with previously used insulins. Total doses include insulin mixture used in 12 patients. White bar = previous insulin used, black bar = lente insulin, horizontal line across bars = average.

Hypoglycemic reactions occurred in 21 patients during treatment with previously used insulins but in only 9 when lente insulin was substituted. Such reactions to lente insulin did not occur in any patient devoid of reactions to previously used insulins, and in no instances were reactions with lente insulin more severe. There was little difference in the time of day when reactions occurred in a given patient on either of the two treatment programs, except that a slightly greater preponderance of reactions in the morning was evident in those patients on therapy with lente insulin. Localized allergy occurred in 12 patients on therapy with lente insulin and in 16 patients on therapy with previously used insulins. Eight of the 16 patients manifesting allergy to previously used insulins were likewise allergic to lente insulin. Such allergic phenomena were evanescent (persisting only a few days) in 12 patients during therapy with previously used insulins and in 9 patients during lente insulin therapy. Allergy was eliminated only when special beef preparations of the respective insulins were substituted in four patients on therapy with previously used insulins and in three patients on therapy with lente insulin. (Special beef lente insulin may be obtained for use in patients with persistent allergy to the conventional insulin preparation.) A transient, localized burning sensation at the sites of injection was described by nine patients receiving lente insulin, while only five patients reported a similar experience after injection of isophane insulin.

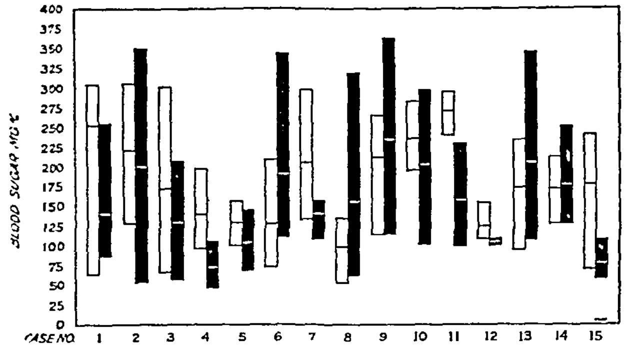

Fig. 2.—Average and range of fasting blood sugar values in 15 patients comprising group 3A. Note that 10 showed lower average values but that 9 showed wider range of values on therapy with lente insulin. Control is generally poor on either insulin program. White bar = previous insulin used, black bar = lente insulin, horizontal line across bars = average

Group 2.—In group 2, 8 of 18 patients exhibited definite improvement in control of the blood sugar level, and the remaining 10 showed equally good control with lente insulin (fig. 1). The degree of over-all clinical control paralleled these blood sugar levels without exception. Grand averages of fasting and postprandial blood sugar values and the average daily dose of insulin for this group as a whole were significantly lower during therapy with lente insulin, as illustrated in figure 1. Hypoglycemic reactions occurred in 17 patients during treatment with previously used insulins but in only 15 after therapy with lente insulin was substituted. Reactions were more frequent and severe in one patient but less frequent and less severe in three patients during the latter program. Here again, reactions to lente insulin did not occur in any patient devoid of reactions to previously used insulins. Localized allergy from therapy with lente insulin was noted in one patient who had no previous insulin allergy and in two patients who had had allergic reactions during therapy with previously used insulins. Burning sensations at injection sites were reported from use of lente insulin in one patient and from use of isophane insulin in another case.

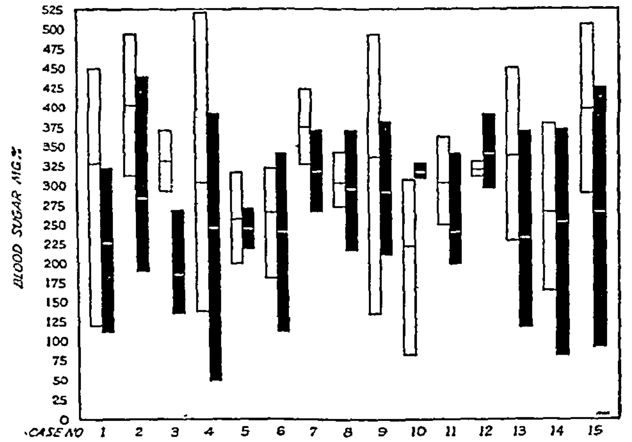

Fig. 3.—Average and range of postprandial blood sugar values in 15 patients comprising group 3A. Note that 13 showed lower average values but that 10 showed wider range of values on therapy with lente insulin. Control is generally poor on either insulin program. White bar = previous insulin used, black bar = lente insulin, horizontal line across bars = average.

Group 3A.—In group 3A blood sugar values showed slight to moderate improvement in control in 8 of the 15 patients, equally poor control in 5 patients, and poorer control in the remaining 2 patients during trials with lente insulin (fig. 2 and 3). Here again, over-all clinical control paralleled control of the blood sugar level. During therapy with lente insulin grand averages of fasting and postprandial blood sugar values were significantly lower for this group; this was achieved by a slightly lower daily dose of insulin (fig. 1). In one case hypoglycemic reactions, occurring occasionally during treatment with the previously used insulin (isophane), were totally absent during lente insulin therapy. On the other hand, reactions to lente insulin were more frequent and more severe in five patients and less frequent and less severe in five patients than corresponding reactions with previously used insulins. In the remaining four patients reactions were essentially similar in frequency and severity on either insulin program. All patients exhibiting reactions to lente insulin had experienced reactions to previously used insulins. Three patients in this group experienced localized allergy to previously used insulins, but only one of these was likewise allergic to lente insulin. The latter was the only patient allergic to lente insulin in this group. As previously mentioned, diabetic control in this group was generally poor. Burning sensations at injection sites were reported from previ-

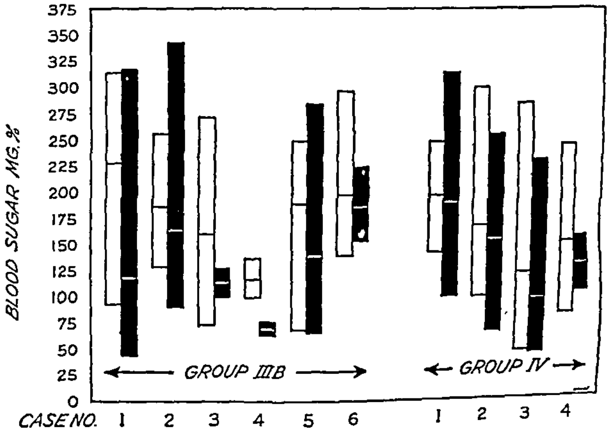

Fig. 4.—Average and range of fasting blood sugar values in six patients comprising group 3B and in four patients comprising group 4. Note that all patients in both groups showed lower average values but that four showed wider range of values on therapy with lente insulin. Patients in cases 1 and 2 of group 4 were on therapy with mixture of lente insulin and zinc-insulin crystals. Diabetic control was generally poor in all cases. White bar = previous insulin used, black bar = lente insulin, horizontal line across bars = average.

ously used insulins in four patients, but no patients in this group experienced this phenomenon from use of lente insulin.

Group 3B.—In group 3B control of blood sugar levels and, likewise, over-all clinical control were definitely improved in one of six patients, slightly improved in two, equally poor in two, and slightly poorer in one during lente insulin therapy (fig. 4 and 5). Here again, average blood sugar values and total daily insulin dosage were significantly lower for the group as a whole during trials with lente insulin (fig. 1). Hypoglycemic reactions were less frequent and less severe in only one patient, slightly more frequent and severe in another patient, and about equally frequent and severe in the remaining four patients during trials with lente insulin. All patients who experienced reactions to lente insulin likewise had reactions to previously used insulins. Localized allergy occurred in two patients during therapy with previously used insulins but in no patients during lente insulin therapy. Burning sensations at injection sites occurred in only one patient in this group, and this was experienced from lente insulin. As previously mentioned, poor control of the diabetes and poor cooperation were characteristic of this group.

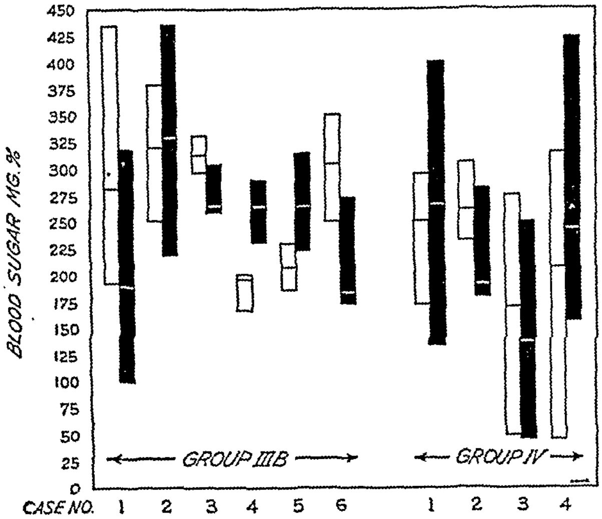

Fig. 5.—Average and range of postprandial blood sugar values in six patients comprising group 3B and in four patients comprising group 4. Note that five showed lower average values but that six showed wider range in values on therapy with lente insulin. In two instances (case 6, group 3B; and case 4, group 4) range is the same with either insulin except that over-all fluctuations do not occur at same levels. Diabetic control generally poor in all cases. White bar = previous insulin used, black bar = lente insulin, horizontal line across bars = average.

Group 4.—In group 4 control of blood sugar levels was slightly improved in two of four patients and slightly poorer in two patients during lente insulin therapy (fig. 4 and 5). Average fasting and postprandial blood sugar values together with the average daily insulin dose for this group reflect the same trend of slightly better control on slightly smaller dosage of lente insulin, as observed in the four preceding groups (fig. 1). Hypoglycemic reactions were definitely less frequent and less severe in three patients but more frequent and severe in the remaining patient. As previously mentioned these were characterized as metabolically unstable diabetic patients in whom attempts to achieve better control of the blood sugar were fraught with increased frequency and severity of hypoglycemic reactions. Conversely, attempts to lessen the frequency and severity of hypoglycemic reactions frequently resulted in bouts of excessive hyperglycemia and ketosis. The degree of superiority of over-all clinical control achieved by lente insulin in the two patients mentioned was actually minimal. A generalized urticarious reaction occurred in one patient while receiving isophane insulin; it disappeared when lente insulin was substituted. One instance of temporary localized allergy to lente insulin was noted in another patient who had exhibited no allergy to isophane insulin. No burning sensations at injection sites occurred in any patient in this group.

Lente and Unmodified Insulin Mixture.—Mixtures of lente and unmodified insulin (zinc-insulin crystals) were tried in 12 patients. These patients were selected as follows: one patient from group 1, two patients from group 2, seven patients from group 3A, and two patients from group 4. Blood sugar control on this program of treatment was distinctly superior in three patients, moderately improved in four patients, equally poor in two patients, and distinctly poorer in the remaining three patients. One of the latter three patients discontinued therapy with the mixture of lente and unmodified insulin and resumed therapy with a mixture of isophane and unmodified insulin after a six months' trial of therapy with a mixture of lente and unmodified insulin (fig. 6). Hypoglycemic reactions were less frequent and less severe in five patients, more frequent and more severe in two patients, and of equal frequency and severity

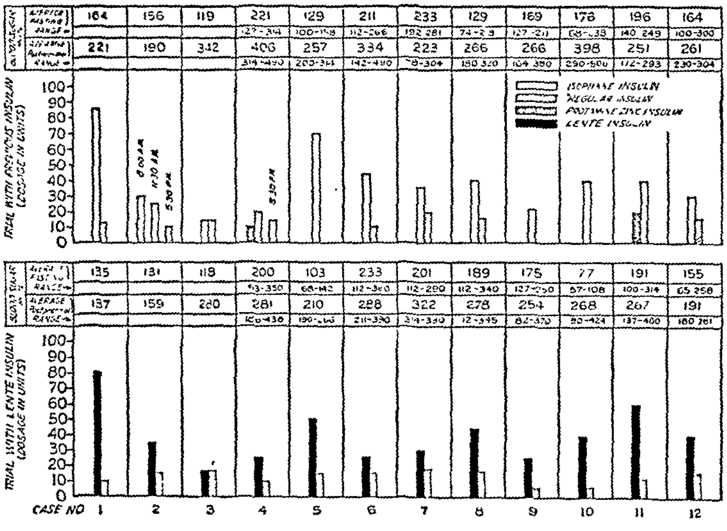

Fig. 6.—Comparison of results of previously used insulin with mixtures of lente and zinc-insulin crystals. Each double column denotes insulin mixture. Single columns denote injection of one type of insulin. All mixtures injected before breakfast. Note that average fasting and postprandial blood sugar levels were lower in seven patients (cases 1, 2, 3, 4, 5, 10, and 12) with the mixture containing lente insulin and that over-all control of the diabetes was significantly improved in each case. Fasting blood sugar determinations were lower in nine patients, as were postprandial values in nine patients. Wider range in fasting and postprandial blood sugar determinations occurred in seven and six patients, respectively, during trial with mixture including lente insulin. One (case 8) changed back to previous insulin program on which this patient had fewer insulin reactions and somewhat more stable blood sugar levels. Results suggest that mixture with lente insulin may be superior in more patients with stable diabetes (cases 1, 2, and 3) but that there are no decided advantages in treatment of patients with unstable diabetes as represented by the remaining cases.

in one patient during therapy with a mixture of lente and unmodified insulin. In three patients, however, reactions occurring while on therapy with previously used insulins entirely disappeared when the lente insulin mixtures were given. One patient experienced no reactions during either of the two clinical trial periods. No allergic reactions whatever occurred in this group.

Each of the 109 patients was asked whether he or she felt better, the same, or worse during treatment with lente insulin, as compared with the previous insulin program. Results are listed in table 1. At the time of this writing only 4 of the 109 patients had discontinued therapy with lente insulin to resume use of the previous insulin.

TABLE 1.—*Patients' Opinion of Their Condition When Using Lente Insulin*

Opinion	Group 1	Group 2	Group 3A	Group 3B	Group 4
Better	20	7	5	3	2
Same	46	10	8	3	2
Worse	0	1	2	0	0
Total	66	18	15	6	4

Hypoglycemic Potentialities of Lente Insulin.—The prolonged observation possible in this study afforded an excellent opportunity to record the protean manifestations of hypoglycemic shock, both quantitatively and qualitatively. It soon became apparent that lente insulin may exhibit all the dangerous hypoglycemic potentialities inherent in other modified insulins. In two patients (one from group 3B and one from group 4) there occurred sudden loss of consciousness without any aura whatever, the patients suddenly falling down. Similar reactions had occurred from previously used insulins in these patients, except that a momentary warning preceded the attacks. Another cumulative hypoglycemic reaction from lente insulin occurring in the case of a 4-year-old-boy in group 1 was characterized by formications and visual hallucinosis in the form of "worms crawling all over the body." The hysterical child was constantly attempting to brush off the worms. Despite chemical correction of the hypoglycemia in the hospital this alarming reaction persisted for eight hours, subsiding gradually thereafter. In this case the child's mother had failed to follow directions in lowering the insulin dosage, as urine tests had shown improved control.

Allergy.—Six of the total of 109 patients, having no allergy to previously used insulins, exhibited definite localized allergy, such as redness, swelling, and itching, at sites of lente insulin injections. In one instance this phenomenon disappeared in the second week with lente insulin therapy. In three instances the allergy disappeared when special beef lente insulin was substituted, but in the remaining two cases allergy persisted even after substitution of special beef lente insulin; however the allergy disappeared upon resuming use of the previous (isophane) insulin. In all groups, a total of 24 patients (22%) exhibited mild to severe allergic reactions during therapy with previously used insulins, while only 15 patients (14%) exhibited similar reactions to lente insulin. A transient burning sensation was experienced at injection sites by 10 patients (9%) on therapy with previously used insulin and by 11 patients (10%) on therapy with lente insulin (table 2).

Among all groups the renal threshold for glucose was considered abnormally high in nine patients and abnormally low in two patients. In these cases more frequent determinations of the blood sugar level were made as an obvious necessity for accurate appraisal of the comparative efficacy of lente and previously used insulins. In the remaining 98 patients urine tests performed four times daily on "second voidings" were found to be a reasonably accurate indication of blood sugar levels.

COMMENT

The statistical analysis illustrated in figure 1 is intended only to reflect an over-all trend in blood sugar values and total daily insulin requirements for each of the five groups during respective trial periods with lente insulin and previously used insulins. Analysis of results hitherto presented by groups disclosed that over-all diabetic control with lente insulin was distinctly inferior to control with other insulin in six patients as follows: in group 1, one patient; in group 3A, two patients; in group 3B, one patient; in group 4, two patients. On the other hand, it should be noted that more or less improved control with lente (or a mixture of lente and unmodified) insulin was achieved in 31 patients as follows: in group 1, 10 patients; in group 2, 8 patients; in group 3A, 8 patients; in group 3B, 3 patients; in group 4, 2 patients. In the remaining total of 72 patients among all groups over-all clinical control was considered equally good, or equally poor, with either lente or the previous insulin used. Space prohibits detailed reporting of the critical analysis to which each patient was subjected before final comparisons were made and judgment passed on the degree of clinical control achieved by the preceding insulin used and lente insulin respectively. In evaluating degree of clinical control, the patients' opinions were ignored, since too often the psychic influence of "trying something new" is at least temporarily in the direction of exaggerating its merits. The generalization that appears most significant is that lente insulin was proved to be distinctly inferior in only six patients.

Dosage and Control.—Lente insulin appears to be somewhat more efficient than isophane insulin on a unit for unit basis in the majority of cases, although its superiority is usually slight. In converting a patient from isophane to lente insulin, these results suggest that one should begin the latter at slightly lower dosage than the current dosage of isophane. This approach will fortify the patient against hypoglycemic reactions in the morning, which appear to be a little more common with use of lente insulin. In occasional instances suppertime and bedtime feedings were increased slightly by redistribution of the total daily caloric intake as further prophylaxis against reactions. Except for the above phenomenon, very little difference was noted in the time of day insulin reactions occurred. It is noteworthy that in

TABLE 2.—*Incidence of Allergic Reactions and/or Burning Sensation at Site of Injection*

Insulin	Allergy		Burning	
	No.	%	No.	%
Previously used	24	22	10	9
Lente	15	14	11	10

group 1 the incidence of insulin reactions fell from 32% to only 14% after conversion to lente insulin. This, coupled with the observation that usually a little more efficient control, or at least equally good control, is achieved by a slightly smaller dosage of lente insulin than the dosage in previously used insulins (in 57 of 66 patients), is impressive evidence that lente may well be the over-all insulin of choice in the average stable diabetic patient whose condition is mild. Such a conclusion appears also justified for the patients in group 2, but similar conclusions cannot be drawn from the data exhibited by the remaining three groups of patients in whom problems are more apt to be those of individualization. In the latter groups improved control of the blood sugar level was too often beset with more frequent hypoglycemic reactions, and, conversely, attempts to eliminate such reactions by reducing insulin dosage eventuated in poorer control of the blood sugar level (a grim reminder that we are still far from the ideal insulin). Indeed, in group 3B the whole problem is further compounded by lack of patient cooperation, but it is of curious interest that apparently slight over-all improvement in control occurred in three patients, disregarding the patients' own opinions, which were also favorable.

In some instances of very unstable diabetes (group 4) the practice of administering two doses of isophane insulin daily (three-quarters of the total dose given before breakfast and one-quarter before supper) was likewise tried with lente insulin, with similar results. True "brittle" diabetes usually cannot be efficiently controlled by any long-acting insulin, including lente insulin. These cases are best controlled by multiple doses of unmodified insulin,[8] since this approach at least eliminates the dangerous, prolonged, cumulative hypoglycemic reactions seen all too often in this group. For example, one such patient, not included in this study, had been without a single hypoglycemic reaction for four years while taking three doses of unmodified insulin daily. She requested a trial of lente insulin and, after appearing to be in excellent control for two weeks, suddenly developed a severe, prolonged hypoglycemic coma, sustaining a scalp laceration from a fall after the onset of sudden unconsciousness. Thereafter, despite every attempt at meticulous regulation, she continued to have sudden, severe, sustained reactions with convulsions. It is of interest that she had tried isophane insulin four years previously with the same catastrophic results. Mixtures of protamine zinc and soluble insulin had been equally unsatisfactory in this patient.

Mixture of Lente with Zinc-Insulin Crystals.—Notwithstanding reports to the contrary, the results of trials in 12 patients indicate that lente insulin can be successfully mixed with zinc-insulin crystals (the dosage of the latter not exceeding that of the former) in situations where enhancement of the quick-acting component is desired. Such mixtures appear to be superior to isophane or protamine admixtures with unmodified insulin, at least in the patient with more stable diabetes (fig. 6). In no case was there evidence that unmodified insulin, when mixed with lente, failed to enhance the quick-acting component or lowered the pH sufficiently to cause crystalline precipitation, thereby unduly prolonging the time action of lente insulin. In fact, the two insulins apparently function independently in such mixtures, according to Holcomb and his co-workers [9] and Marble.[10] However, these observations are to be accepted with reservation in view of the limited trials attempted. They are reported with the hope of stimulating further investigation. It is worthy of emphasis that pH studies carried out by the Lilly Research Laboratories and by the department of biochemistry at the University of North Dakota Medical School reaffirm the assertion that admixture of as much as one part of zinc-insulin crystals with one part of lente insulin does not depress the pH below 5.7, which is still well above the range at which crystalline precipitation of the soluble insulin occurs (pH 5.0). It should rarely, if ever, be necessary to add more than an equal part of soluble insulin to lente insulin; beyond this point there is the hazard of prolonging rather than quickening the time-reaction potential.

Since a total of 94 patients had been taking isophane insulin prior to trials with lente insulin there seemed little to be gained from making detailed individual comparisons in the remaining 15 patients who had been taking other insulins including multiple doses of soluble insulin, mixtures of protamine zinc and soluble insulin, mixtures of isophane and soluble insulin, and, in one patient, globin insulin.

Skin Reactions and Localized Allergy.—While the over-all incidence of allergic reactions is considerably lower from therapy with lente than from other insulins used in this study, it is considerably higher than previously reported (see table 2). In fact, only one instance of allergy was reported in 107 patients followed by Peck, Kirtley, and others.[4] Perhaps some of this discrepancy is predicated upon just what constitutes an allergic skin response to insulin. In the present study only those skin reactions that the patient found annoying were recorded as allergic phenomena from use of insulin. Furthermore, some skin reactions did not develop until after the insulin had been given for a period of time. In several instances the phenomenon was very transient, persisting only a few days. As Marble [11] has pointed out, the incidence of skin reactions to insulins as noted by various observers has varied "from less than 10% to 55.8%." Such differences are apparently due to the care with which patients are examined after injections and whether mild responses are included as reactions. It has long been known that the incidence of allergic reactions to insulin itself falls precipitously when the latter is recrystallized several times during manufacture.

The occurrence of localized allergy from use of lente insulin in six patients who had no such reactions to previously used insulins merits special emphasis. In three of these patients there is no doubt that such allergy was due to pork insulin, since the use of special beef lente insulin proved to be nonreactive. Because of the two patients whose allergy persisted after substitution of special beef lente insulin (despite total absence of allergy to isophane insulin), there is strong evidence that some sensitizing agent exclusive of insulin and zinc may be present in the lente insulin preparation.

Burning Sensations at Injection Sites.—The transient burning sensation at injection sites noted with about equal frequency from use of lente and other insulins can be quite annoying to the patient and may be simply another sensitivity phenomenon without skin manifestations. The sensation cannot be attributed to traces of alcohol in the syringe, because it also occurred in patients who boiled their syringes before each injection and used no alcohol. Phenol is not responsible for this (in fact, phenol has a local anesthetic effect), for it is present in all Lilly insulins except lente insulin. That insulin itself is not responsible for this phenomenon is borne out by the observation that 17 patients experienced burning from only one of two insulin preparations tried. Zinc cannot be incriminated since one patient who experienced burning from use of lente insulin had no such discomfort from globin insulin with zinc, the zinc content of which is even higher than that of lente insulin. This problem is annoying enough to deserve more detailed investigation.

Patients' opinions listed in table 1 were recorded purely for curiosity and were not utilized in any way to influence interpretation of results. The wisdom of this is apparent from the fact that, among the total of 106 patients who stated that they felt either the same or better while taking lente insulin, there were actually 5 patients in whom over-all clinical control with lente insulin was inferior to control with previously used insulins. At the recent British Diabetic Association meeting, Dr. S. G. Oakley of London reported that his trials with lente insulin were very successful in children and in new patients but that in old patients the dose of lente insulin had to be increased by at least 25% when changing over from previous insulins, "otherwise deterioration and ketosis might occur." [12] A careful analysis of the present series of 109 patients failed to confirm this observation.

SUMMARY AND CONCLUSIONS

Evidence has been presented to indicate that, with a few exceptions, lente insulin can be substituted for isophane insulin on a unit for unit basis; however a slightly lower dose of lente insulin is suggested at the outset, since many patients exhibit significantly better diabetic control on therapy with slightly less lente than isophane insulin. With some exceptions, diabetic control is smoother and insulin reactions fewer and milder in stable diabetic patients when lente insulin is substituted for the previously used insulin. Since lente insulin is the purest long-acting insulin yet developed (devoid of any foreign protein except that which is inherent in the insulin itself), it should be used in every diabetic patient in whom it achieves good clinical control in the absence of persistent allergy. While lente insulin is competitive with, and indeed sometimes superior to, other insulins, with or without admixture, in cases of more severe and unstable diabetes, it is subject to the same decided limitations as its predecessors. Its selection in such cases is distinctly an individual problem and not a substitute for sound clinical judgment. It is axiomatic that in practice the clinician should fit the insulin to the patient and not the patient to the insulin.

Allergic phenomena of a localized nature are seen in a significant percentage of patients receiving lente insulin, although less commonly than in the case of other modified insulins. In such instances the use of special beef lente insulin may be necessary, although the allergy is usually a temporary disturbance. A hitherto unreported phenomenon is the occurrence of definite localized allergy to both lente and special beef lente insulin in two patients who exhibited no allergy to isophane insulin. Hypoglycemic reactions can be just as severe and cumulative from use of lente insulin as reactions encountered with other modified insulins. Such reactions may be presaged with ample warning or may occur suddenly without warning. In patients with milder, more stable diabetes, however, the over-all incidence of reactions from use of lente insulin was decidedly lower among the 66 patients studied (group 1).

Despite earlier reports to the contrary, admixture of lente and unmodified insulin (zinc-insulin crystals) appears to be efficient and practicable, at least in the more stable cases of diabetes mellitus, but further studies are necessary to clarify its limitations in this regard. Until further investigation is forthcoming in the problem of mixtures of the two insulins, it is suggested that no mixture should contain more unmodified insulin than lente insulin, to avoid disrupting the buffer mechanism that preserves the independent time-action potential of lente insulin. Insulin made from zinc-insulin crystals constitutes the preferred unmodified insulin of choice for admixture at the present time.

ADDENDUM

Since the completion of this study, an additional 100 diabetic patients have been subjected to clinical trial with lente insulin. While observation and statistical analysis of this group have been less meticulous, the over-all results appear to be congruent with those in the foregoing report.

Congestive Heart Failure.—The ability of the heart to fulfill its function in maintaining the circulation can be influenced materially by diet. By appropriate dietary regulation using subcaloric feedings in acute failure, the work of the heart is reduced, thereby increasing blood flow, lowering the blood pressure, slowing heart rate, increasing vital capacity, and inducing diuresis. The restriction of dietary sodium is a basic step in avoiding fluid retention due to impairment of renal sodium excretion. Effort should be made to assure adequate potassium tissue stores by the periodic administration of potassium salts to chronic failure cases. Supplemental vitamin therapy is required as shown by the presence of low tissue vitamin stores in heart failure and the high rates of vitamin excretion during diuresis. The assurance of an adequate protein intake is urgently needed in the hope of avoiding the evidences of protein malnutrition which eventually appear in so many of these patients.—M. G. Wohl, M.D., C. R. Shuman, M.D., and C. Alper, Ph.D., Nutritional and Metabolic Aspects of Congestive Heart Failure, *A. M. A. Archives of Internal Medicine,* July, 1955.

EFFECTIVENESS OF SALICYLAMIDE AS AN ANALGESIC AND ANTIRHEUMATIC AGENT

EVALUATION OF THE DOUBLE BLINDFOLD TECHNIQUE FOR STUDYING ANALGESIC DRUGS

Robert C. Batterman, M.D.
and
Arthur J. Grossman, M.D., New York

In view of the interest shown salicylamide for its analgesic and antirheumatic effect, it was thought advisable to study both of these under conditions that would lead to statistical evaluation with placebo and other salicylate therapy. Ichniowski and Hueper[1] found that in rats salicylamide, upon oral and intraperitoneal administration, exerts a slightly quicker and deeper depressing effect than aspirin. Hart[2] noted that the relative analgesic potencies in animals for aspirin and salicylamide were 1 and 7 respectively. Hart also noted that, in a group of 118 patients with arthritis treated with 2 gm. of salicylamide every four to eight hours, satisfactory relief was obtained in 75% of the subjects, but 22% had some untoward reaction. Studies of clinical results with salicylamide, available principally in European literature,[3] favored salicylamide over aspirin. It was noted, however, that large doses of salicylamide are required and that the action of the drug is similar to that of the other salicylates. Our studies of salicylamide were divided according to several plans because we were interested not only in evaluating its analgesic and antirheumatic actions but also in studying the method for the general problem of screening analgesics of this type.

EFFECTIVENESS AND PREFERENCE

In the first study, the effectiveness and safety of salicylamide as an analgesic and antirheumatic agent for musculoskeletal conditions were investigated and compared to aspirin and placebo medication according to the double blindfold technique. Preparations were administered in either tablet or capsule form, with identical appearance for each medicament. No one associated with the investigation was aware of the type of medicament prescribed for any particular patient, since the preparations were supplied according to a code not available to the investigators and were known as S-1 (aspirin), S-2 (placebo), and S-3 (salicylamide). At the end of the investigation, results were analyzed by accepted statistical methods and the code was disclosed.

There were 73 subjects, with the majority of patients presenting pain secondary to osteoarthritis and/or musculoligamental spasm or strain associated with the resultant postural imbalance. The distribution of arthritic conditions was typical of that found in any large arthritis service. Patients were advised to take two tablets or capsules of the medicament, equivalent to 0.6 gm. of salicylamide, aspirin, or placebo, every four hours and returned to the clinic at intervals from one to three weeks. At the next clinic visit, the patient was questioned carefully in regard to the change in status, relief of pain, time required for relief if any did occur, duration of such relief, degree of pain, disability and joint swelling, and the occurrence of untoward reactions. Then, without the patient's knowledge, another medicament was substituted and the procedure repeated for another period. The selection of any particular medicament was based entirely on random sampling. In this manner, it was possible to compare all three medicaments in 43 subjects, and it was possible in 20 of the remaining subjects to compare at least two of the medicaments. In all, 55 subjects received S-1, 57 subjects received S-2, and 61 subjects received S-3.

Meaning of Effectiveness.—The analysis of effectiveness is based on satisfactory analgesia according to criteria published previously[4] and in essence represents a balance between analgesia and occurrence of untoward reactions or intoxication. From a clinical point of view, a satisfactory analgesic should be capable of alleviating a painful condition for a minimum period of two to three hours without the occurrence or overshadowing of the analgesic response by untoward reactions. Thus, the drug may result in complete relief of pain, but, if nausea and vomiting occur persistently, the analgesic response is not considered to be satisfactory.

Results in Terms of Effectiveness.—The results in terms of effectiveness and untoward reactions for the three preparations are presented in table 1. The over-all effectiveness for each agent appeared to be the same. Thus, S-1, S-2, and S-3 gave satisfactory analgesia in 56.3, 59.6, and 60.6% of the patients respectively.

From the Department of Medicine, New York Medical College, and the arthritis services of Flower and Fifth Avenue Hospitals and Welfare Dispensary (Metropolitan Division).

In terms of toxicity, we noted untoward reactions in 14 out of 55 patients with S-1, for an incidence of approximately 25%. This took the form primarily of gastrointestinal disturbances, with nausea, eructations, heartburn, and epigastric distress as the major reactions. S-2 resulted in 10 out of 57 patients having reactions, for an incidence of approximately 17%. With this drug, it was noted that there were just as many patients complaining of headaches and dizziness as gastrointestinal distress. With S-3, 19 out of 61 patients, or 31%, had reactions that were evenly distributed between gastrointestinal and central nervous system reactions.

Results in Terms of Preference.—In terms of comparison between medicaments and preference for any one as compared to the other two (table 2), there appeared to be a tendency to prefer S-2. There were 92 comparisons with S-1, of which 47 were with S-2 and 45 with S-3. By a statistical analysis, there was questionable significance between S-1 as compared to S-2 and no significance between S-1 and S-3; however, the 49 subjects in whom we were able to compare S-2 and S-3 significantly preferred S-2. There were 40 subjects who received all three agents. Five presented no relief with any, 9 preferred S-1, 17 preferred S-2, and 9 preferred S-3.

COMPARISON WITH *N*-ACETYL-*p*-AMINOPHENOL

A similar blindfold study, but comparing salicylamide, *N*-acetyl-*p*-aminophenol, and placebo medication, was made a second time, using the blindfold technique. Results of this study are given in table 3. Again we noted a similar result of placebo and salicylamide therapy.

RELIEF OF VARIOUS CONDITIONS

In the third study, wherein we compared the three drugs for relief of a wide variety of medical and surgical conditions where the pain was mild to moderate in severity, we were able to observe 46 subjects. All patients received all three drugs at intervals during the day, depending upon the response and occurrence of untoward reactions. The choice of the initial drug was made entirely by random sampling so that the effects of prior medicaments would not influence the results of subsequent medicaments. It was noted (table 4) that S-1 resulted in relief in approximately 60% of the patients, S-2 in approximately 47%, and S-3 in 27%. There were 16 patients who presented no relief with any of the drugs. With the exception of the 16 patients who failed to respond and 2 patients who presented no preference, it was noted that 15 patients preferred S-1, 9 preferred S-2, and 4 preferred S-3. Upon statistical analysis, there was no significance to the preference of S-1 over S-2 or over S-3, but there was considerable significance of S-1 over S-3.

RELIEF OF ARTHRITIC CONDITIONS

The effectiveness of salicylamide for the treatment of arthritic conditions was also evaluated, with full knowledge of what was administered. After the treatment of 20 ambulatory patients for a period of several days to 10 weeks, the results were so unfavorable for salicylamide that this phase of the investigation was discontinued. Only 7 out of 20 patients presented any improvement. In two patients, this may have been the natural course of the condition. In two other patients, the relief was slight and therefore insignificant. In only three patients were the results considered a satisfactory analgesic response.

EFFECT OF DOUBLE BLINDFOLD TECHNIQUE

Since the double blindfold technique indicated on two studies that aspirin and *N*-acetyl-*p*-aminophenol are also as effective as a placebo, which is exactly opposite to our experience with these drugs, and since the unsatisfactory analgesic response of salicylamide was demonstrated by the previous study, we seriously doubted whether the double blindfold technique was a valid method of distinguishing between the effectiveness of analgesic agents. It was therefore decided to reevaluate the other drugs with full knowledge of what was to be administered. In addition, we attempted to evaluate the reverse possibility, wherein the patient was psychologically prepared, and thus influence the results for greater effectiveness. Utilizing the powers of suggestion, we gave the patients a known medicament and informed them that this medicament was new, very powerful, and the best treatment for the pain of arthritis that could possibly be obtained. The results as noted in table 5 suggest that the double blindfold technique appears to "level off" the effectiveness of analgesic agents up to 50 and 60%, regardless of their potency. Weak or placebo medicaments show up more favorably than when studied as such, and effective medicaments appear not as effective as they should be.

TABLE 4.—*Analgesic Effectiveness of and Preference for Salicylamide, Aspirin, and Placebo Medication for Hospitalized Patients*

Effectiveness		Preference		
Medicament	Effective Relief, %	Medicament	Compared with	Significance Student "t"
Aspirin (S-1)	60.0	Aspirin (S-1)	Placebo (S-2)	1.78
Placebo (S-2)	46.6	Aspirin (S-1)	Salicylamide (S-3)	4.30
Salicylamide (S-3)	26.6	Placebo (S-2)	Salicylamide (S-3)	2.13

TABLE 5.—*Relief of Arthritic Pain*

				Untoward Reactions	
Medicament	Patients, No.	Satisfactory Analgesia	Effectiveness, %	Patients, No.	%
Aspirin	87 128	45 68	51.7 53.1	24 30	27.5 23.4
Placebo	41	19	46.3	5	12.2
Placebo (patients psychologically prepared)	43	15	34.9	9	20.9
N-Acetyl-*p*-Aminophenol	123	81	65.8	19	15.0
Formula A (Anacin type)					
Double blindfold	94	60	61.8	30	31.9
Patients psychologically prepared	43	20	46.4	12	27.9

COMMENT

Before any specific agent is classified as an effective drug to relieve pain or alleviate a musculoskeletal condition, the method for determining the effectiveness in these regards must be carefully considered. Comparative testing of drugs possessing the approximate potency of salicylate are difficult to evaluate because the response elicited by their use is not as dramatic as the response after the administration of morphine or meperidine. Techniques have therefore been devised to evaluate such agents presumably without prejudice on the part of the investigator. The double blindfold technique, in which the medicaments are prescribed in a code form without the investigator or the patient being aware of what is prescribed, has been recommended by many as an answer to this problem. It has been our experience that this technique may be of value for short-term experiments, especially in hospitalized or bedridden patients, but, with prolonged administration, regardless of the ambulatory or hospitalized state of the patient, the results are confusing and misleading.

It is with surprise that we note the same effectiveness for placebo medicaments, known effective analgesics, and unknown drugs. Regardless of the medicament administered, we always achieve the same result. There appears to be an incidence of effectiveness that occurs with all medicaments with the double blindfold technique, regardless of what preparations are investigated. Placebo medicaments, which under the usual methods of study[4] result in an effectiveness of approximately 40%, will show with the double blindfold technique an effectiveness of approximately 60%. On the other hand, preparations that in our experience will result in an effective response in over 60% of the patients will have a lowering of this response to approximately 60% when studied by the double blindfold technique. This "leveling off" of incidence of effectiveness will erroneously condemn many drugs as ineffectual. Thus, aspirin, if studied under such a regimen, would be rejected because the same response was achieved with placebo medication. Since this is contrary to the universal experience with salicylates, we seriously questioned the validity of the double blindfold technique for the evaluation of such drugs. We were, therefore, not impressed by the similarity of response of salicylamide and placebo therapy, and further studies had to be devised to compare the effectiveness of salicylamide and aspirin. We find that a single blindfold technique, where the physician is aware of the medicament to be used, gives the most useful data for analysis. When large numbers of patients are treated and the over-all responsiveness to a placebo is known, then the unknown drug can be administered to the same or a different group of patients for its own incidence of effectiveness. Whether the two drugs have to be studied in the same patient is open to dispute. First of all, conditions existing at the time each drug is administered may be entirely different. Secondly, the subsequent administration of the medicament may be influenced by the effects achieved previously. Thus, in order to compare an unknown drug to a placebo or standard analgesic agent, it is best to do so by means of alternate patients or large groups of patients treated with each agent alone. Statistical evaluation will then determine how much more effective the unknown is in relation to the placebo or standard medicament. The question may arise as to the prejudice and responsiveness of the patient to suggestion. We found that the single blindfold technique was not influenced by the suggestibility of the patient. An attempt to increase the effectiveness of the placebo by psychologically preparing the patient resulted in no greater effectiveness. On the other hand, the incidence of untoward reactions may be altered. The suggestion that a "more potent" drug is being used and emphasis as to what to anticipate from the medicament may result in a higher incidence of toxic reactions. This experience of obtaining approximately 60% effectiveness for both the placebo medicament and other agents under investigation is not unique for analgesic testing. Similar results have been reported for drugs studied for the anginal syndrome [5] and for mephenesin.[6]

An explanation for this "leveling off" effect of the double blindfold method is not at hand. Speculation as to reasons for this interesting phenomenon does not solve the problem that exists. The subjectivity of the patient's complaints warrants a careful analysis of the techniques involved in the investigation of therapeutic measures recommended for their alleviation. When these complaints are of a chronic nature, the study should be so designed as to answer this question: Is the therapy effective for a prolonged treatment of the condition? The single administration of a drug or its use for fixed intervals of a few days or even a few weeks does not reflect the clinical aspects for satisfactory control of the symptom. Although the double blindfold technique is helpful in a short-term experiment, as was noted in our study on hospitalized patients, it is of no value when the same medicament is evaluated for the prolonged therapy of the same symptom.

CONCLUSIONS

Salicylamide is not an effective analgesic or antirheumatic medicament in man. The double blindfold technique as applied to an evaluation of analgesic and antirheumatic drugs in ambulatory patients does not show any differentiation between placebo therapy or effective medicaments. Each investigation group should determine the responsiveness to placebo medication for its particular type of patients and use these data as a control for evaluation of unknown analgesic or antirheumatic drugs.

CLINICAL NOTES

RELIEF OF AMBLYOPIA IN PITUITARY APOPLEXY BY PROMPT SURGICAL INTERVENTION

Henry A. Shenkin, M.D., Philadelphia

The objective of neurosurgical attack upon tumors of the pituitary gland has always been the prevention of impairment or loss of vision from gradual compression of nearby optic pathways. Attention has recently been called to the occasional sudden expansion of a pituitary tumor by hemorrhage within it causing sudden amblyopia among other acute symptoms. The first comprehensive article on this subject is by Brougham, Heusner, and Adams,[1] which appeared in 1950. Further reports are by Fountain, Baird, and Poppen,[2] in 1951, and List, Williams, and Balyeat,[3] in 1952. In these previously reported cases, the vision in patients who survived was generally unimproved from the state induced by the initial hemorrhage into the tumor. Operative intervention did not occur or was frequently delayed because of difficulty in diagnosis and/or the poor general condition of the patient. Two recently encountered experiences with patients who have had acute, massive hemorrhages into pituitary adenomas producing amblyopia are reported to illustrate the gratifying effects of prompt operative intervention in restoring vision. In one instance modern endocrine therapy made prompt surgical intervention possible, and this latter experience further suggests that the objective of decompressive surgery may be the preservation of endocrine function as well as the preservation of vision.

REPORT OF CASES

CASE 1.—A 39-year-old white man was first admitted to the Graduate Hospital on April 25, 1953, with a one year history of left frontal headaches and episodes of pain in the left eye radiating to the left ear and jaw and left side of the neck. The latter came on each evening and awakened him from sleep early each morning. Three weeks prior to admission to the hospital his symptoms had become more intense. In the preceding two years he had noted distortion of his left field of vision and difficulty in using his left eye for reading, losing the beginning of each sentence. The patient had five children, the youngest being 10 months old. He denied any sexual difficulties at any time.

His blood pressure was well maintained throughout his hospital stay at 110/75 mm. Hg. A complete blood cell count and urinalysis were both normal, as were his fasting blood sugar and blood urea nitrogen levels. The visual acuity through a pinhole was $6/6 + 4$ in his right eye and 6/12 in the left. The optic fundi showed slight blurring of the nasal margins of the disks without measurable elevation, and the left disk was slightly paler than the right. Visual fields examination (fig. 1*A*) demonstrated a left temporal hemianopia with a full field for the right eye. An x-ray of the skull revealed ballooning of the sella turcica,

the anteroposterior diameter measuring 20 mm. and the vertical diameter 15 mm. The anterior clinoids were slightly sharpened. A diagnosis of chromophobe adenoma of the pituitary was made, and deep x-ray therapy was started, with visual fields being tested daily.

By May 8, 1953, the patient's headaches had disappeared, his visual acuity was well maintained, and his left visual field was perhaps slightly expanded. He was, therefore, discharged from the hospital and was to receive x-ray therapy three times weekly as an outpatient. From April 29 to May 13, 1953, 1,840 r was delivered into the tumor. On May 15, 1953, at 2 a. m. he was awakened from sleep by severe headache and vomiting, and he complained that he was completely blind in the left eye. At 7 a. m. I was called, and the patient was brought by ambulance 11 miles to the hospital. On arrival his vital signs were normal except for a temperature of 99.3 F. Blindness of the left eye was confirmed, the pupil failing to react to light. He was taken directly to the operating room, and a left transfrontal craniotomy commenced before 10 a. m. of the same day. Nitrous oxide, oxygen, and ether anesthesia was administered endotracheally after thiopental induction. After elevating the left frontal lobe, a bluish tumor was seen emerging beneath the chiasm and placing severe tension on the left optic nerve. The capsule was incised, and dark, old blood oozed out under pressure together with necrotic appearing tissue. The contents of the tumor capsule were thoroughly aspirated, sufficient amounts of tumor being preserved for histological examination. All tension on the optic chiasm and nerves was relieved. Microscopic examination of the tissue revealed a typical chromophobe adenoma of the pituitary gland.

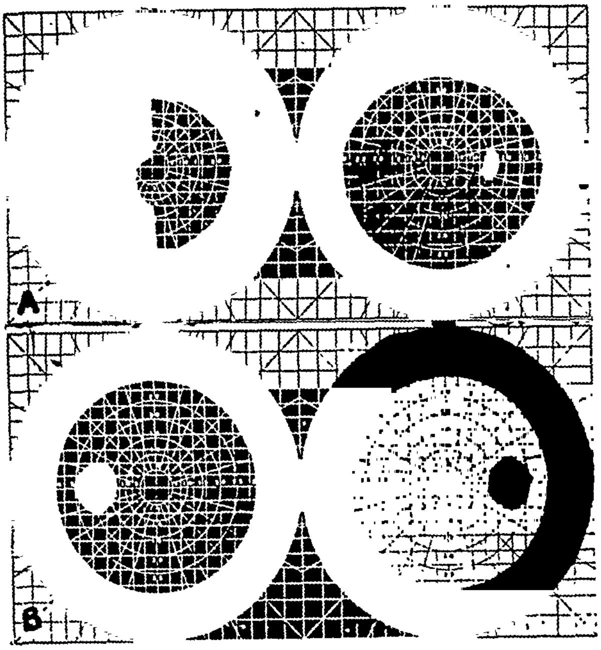

Fig. 1.—Visual fields of the patient in case 1, *A*, three weeks preoperatively, and *B*, one year postoperatively (modified Bjerrum screen [Berens]).

The patient's convalescence was uneventful, and an examination of his optic fundi May 21, 1953, revealed sharply outlined optic disks. The visual acuity of the right eye was 6/6 and of the left eye 6/12, and the visual fields showed marked improvement as compared with his preoperative examination. The patient was discharged from the hospital on May 27, 1953. By June 12, 1953, visual acuity in the left eye had improved. Indeed, acuity was 6/5 in both eyes, with considerable widening of the left temporal field. The patient returned to work on July 1, 1953, and has not missed a day since. Over the following year the visual field of both eyes returned to normal (fig. 1*B*), and his activity was completely normal, including sexual relations, without benefit of endocrine replacement therapy.

CASE 2.—A 31-year-old white man, married 10 years, with one 7-year-old child, was admitted to the Albert Einstein Medical Center, Southern Division, April 29, 1954. The patient's medical history began five years previously when he first noted marked asthenia, loss of libido, and loss of axillary, pubic, and facial hair. He was told he had an anemia, and treatment, directed chiefly toward his anemia, was given by numerous physicians until he was admitted to a hospital in a neighboring city Jan. 25, 1954, because of continuing loss of strength. At that time his blood pressure was normal and eyegrounds were also thought to be normal. Visual fields were reported to be full to confrontation. The left testis was softened and atrophic, the right testis was smaller and softer than normal, and the prostate was hardly palpable rectally. Pubic and facial hair were markedly diminished, and the axillary hair was practically nonexistent. Hemoglobin determinations varied from 12.5 to 12.9 gm. per 100 cc. of blood and the red blood cell count varied from 3,750,000 to 4,300,000 cells per cubic millimeter. A basal metabolic rate was -21, and total cholesterol content was 223 mg. per 100 cc. A skull x-ray revealed a markedly enlarged sella turcica. A diagnosis of chromophobe adenoma of the pituitary was made. The patient was discharged Feb. 3, 1954, with the intention of starting endocrine replacement therapy. He was readmitted Feb. 8, 1954, to the same hospital with complaints of chest pain, fever, and vomiting of 48 hours' duration. Upon his second admission his blood pressure was 78/60 mm. Hg. After several liters of saline solution intravenously given he improved markedly. However, his anemia now appeared more marked, hemoglobin level being 11.7 gm., and there were only 3,500,000 red blood cells per cubic millimeter. He was placed on therapy with desoxycorticosterone acetate, 5 mg. twice daily, testosterone, 50 mg. three times weekly, and hydrocortisone, 20 mg. twice daily. He made a prompt recovery and was discharged Feb. 25, 1954, on a regimen of thyroid, ½ grain (30 mg.), hydrocortisone, 20 mg., and ferrous sulfate, 90 mg. daily, and testosterone, 25 mg. three times weekly.

He was able to resume his sexual life and seemed to be getting along until April, 1954, when he complained of visual difficulties, and for the first time on April 9, 1954, visual fields were done and an incomplete bitemporal hemianopia was noted (fig. 2*A*). On April 27, 1954, he was seized with severe headache, vomiting, and total blindness. He was admitted to the neurosurgical service of the Albert Einstein Medical Center, Southern Division, April 29, 1954, at 10 a. m.

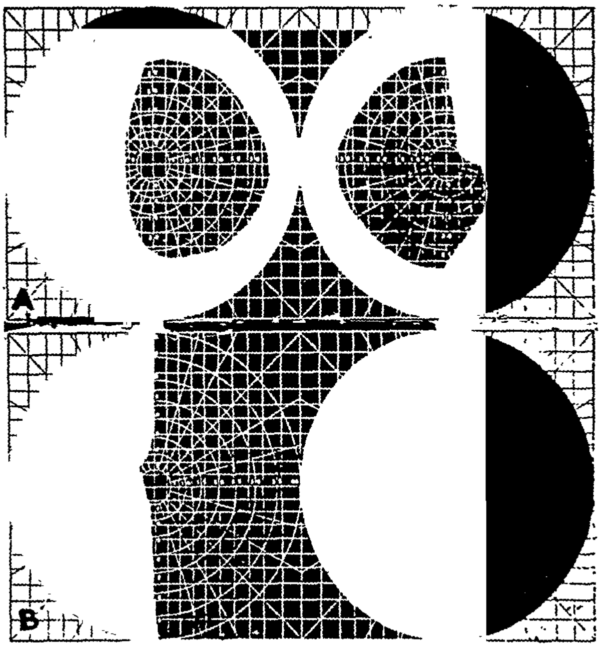

Fig. 2.—Visual fields of the patient in case 2, *A*, three weeks preoperatively, and *B*, four and a half months postoperatively (modified Bjerrum screen [Berens]).

His blood pressure on admission was 136/76 mm. Hg, pulse 128, respiration 28, and rectal temperature 106.2 F. The patient was conscious and oriented, but totally blind. The optic disks had a yellowish color, and the margins were distinct. The patient's neck was slightly rigid, and a mild bilateral Kernig's sign was present. There were no other neurological findings. Electrolyte studies revealed the plasma sodium level to be 131 mEq. per liter and the potassium level 3.8 mEq. per liter. The red blood cell count was 5,460,000 per cubic millimeter, with 15.6 gm. of hemoglobin per 100 cc.; the white blood cell count was 23,700 per cubic millimeter, with 53% polymorphonuclear cells and 33% lymphocytes. The blood pH was 7.29.

Operative intervention was delayed in an effort to control the fever. Ice packs were applied, intravenous infusion of saline solution was started, and 100 mg. of cortisone was given intramuscularly. By 2 p. m. of the day of admission the patient's temperature had come down to 103 F, but no blood pressure was obtainable. The patient remained conscious but was very dull and somnolent. Phenylephrine (Neo-Synephrine) hydrochloride, 2.5 mg. in 5% glucose in isotonic sodium chloride solution, was given intravenously, and 5 mg. of desoxycorticosterone acetate was given intramuscularly. The patient also was given 500 cc. of whole blood. Administration of the desoxycorticosterone was repeated in two hours and the intravenous administration of phenylephrine continued throughout the night. Administration of the cortisone was continued in 100 mg. doses every six hours. The patient continued to vomit small amounts throughout the first 24 hours in the hospital. By the next morning, April 30, 1954, the patient's temperature was 100 F rectally and the systolic blood pressure was well maintained at between 100 and 110 mm. Hg.

The patient was then taken to the operating room, and a right transfrontal craniotomy was carried out with the patient under local anesthesia. Just as operation began, the blood pressure was reported at 180/110 mm. Hg. The right frontal lobe was elevated, and a large intrasellar tumor was seen severely compressing the optic chiasm and nerves. The capsule was very tough and incision with a knife was required to open it. A good amount of dark brownish fluid escaped, and this relieved the pressure on the optic nerves and chiasm. The contents of the tumor were thoroughly aspirated, several good pieces being preserved for biopsy. While the scalp was being repaired, blood pressure was reported to be 260/180 mm. Hg. In fear of the consequences of this hypertension, 500 cc. of blood was removed rapidly from a vein. At the completion of the venesection, the blood pressure was unobtainable and, therefore, 150 cc. of blood was returned to the patient, with the blood pressure rising to 170/100 mm. Hg. Total elapsed operating time was 80 minutes. Microscopic examination of the tissue removed revealed it to be a chromophobe adenoma.

The patient was maintained on cortisone therapy, 100 mg. every six hours, and by the next morning, May 1, his temperature was 101 F rectally, he was fully conscious, his blood pressure was 130/80 mm. Hg, pulse rate 80, plasma sodium level 140 mEq. per liter, and potassium level 4.5 mEq. per liter. He definitely could see at least finger movements with his left eye. His improvement was continuous except that it was clear by the second postoperative day that he had diabetes insipidus, excreting as much as 7,600 cc. of urine in a 24 hour period during the next week. This was controlled by vasopressin (Pitressin) tannate in oil, 0.5 cc. given intramuscularly every other day. Cortisone therapy was reduced progressively, and, by the fourth postoperative day, the patient was being maintained with 25 mg. given four times daily. On May 7, 1954, the visual acuity of the left eye was 20/70 and there was a complete temporal hemianopia. The right eye was completely blind. The patient was ambulatory by the fourth postoperative day and was discharged from the hospital on May 13, maintained with cortisone therapy, 25 mg. orally twice daily, methyltestosterone sublingually, 10 mg. three times daily, and vasopressin tannate in oil, 0.5 cc. every other day. On June 7, 1954, the dose of vasopressin was reduced to an injection every third day and administration of testosterone cyclopentopropionate, 300 mg. to be given intramuscularly every 30 days, was started. X-ray therapy to the sella turcica was begun and completed by July 16, 1954, and a total of 3,000 r was delivered into the tumor. The x-ray therapy made the patient sluggish and tired, and thyroid, 1 grain (60 mg.) daily, was prescribed.

In September, 1954, vasopressin therapy was discontinued entirely, and no symptoms of diabetes insipidus have reappeared. The right eye has remained blind, but vision has improved in the left eye to 20/40, with a complete temporal hemianopia persisting in this eye (fig. 2*B*). The patient feels well, is energetic, and reports sexual relations are entirely normal. He began working for the first time Oct. 1, 1954, as an apartment house maintenance worker and has been regularly employed to the time of this report. Preoperative and postoperative endocrine treatment of this patient was managed by Dr. Norman G. Schneeberg.

COMMENT

Disability from gradual compression of nervous tissue in many instances can be overcome by delayed surgical decompression. Equal impairment of function following acute compression, on the other hand, appears irreversible in a matter of hours. Such experience in compression of the spinal cord is common to all surgeons. It may be roughly stated that decompression of nervous tissue may be delayed with any hope of recovery of function only as long as it took for the disability, or any segment of that disability, to appear. It would seem the optic chiasm and nerves are no exception to this experience. It may further be pointed out that with modern, powerful endocrine agents, neurosurgeons should be more courageous in attacking pituitary tumors, which cause the patient to be very ill. It is the more true since undoubtedly expanding neoplasms impair the function of remaining normal endocrine tissue, which could recover and help protect the body if relieved of compression.

SUMMARY

In two cases of acute hemorrhage into a pituitary adenoma amblyopia resulted. In addition, the hemorrhage in one patient caused an acute hypothalamic and Addisonian crisis. Prompt surgical intervention (within eight hours in one patient and three days in the other) permitted complete recovery of vision in one patient and recovery of useful vision in the other. Surgical decompresson did relieve one patient of a severe endocrine crisis and hypothalamic dysfunction by removing pressure from remaining normal pituitary tissue and the hypothalamus.

RECOGNITION OF BILIARY TRACT OBSTRUCTION WITHOUT JAUNDICE

Thomas H. Brem, M.D., Los Angeles

Obstructive jaundice and the use of liver function tests for its diagnosis are widely understood. Biliary tract obstruction in the absence of jaundice, however, is rarely recognized or even thought of, even though it is of relatively common occurrence and can be detected frequently by the application of appropriate liver function tests. The identification of obstructive jaundice depends on the presence of an increased level of direct-acting bilirubin in the serum or bilirubinuria and abnormal results in tests of biliary tract patency, that is, an elevated serum alkaline phosphatase level and/or cholesterol in the presence of tests of normal parenchymal

---

function, such as the cephalin-cholesterol flocculation and thymol turbidity tests.

Partial obstruction of the biliary tract may produce the same pattern of liver function tests, even though the serum bilirubin level is not elevated. In addition, the sulfobromophthalein test, which in the presence of jaundice provides no further information, may be used to advantage in that its results are frequently abnormal in this situation. The pattern of liver function tests in partial biliary obstruction without jaundice thus consists of elevation of the serum alkaline phosphatase activity and abnormal sulfobromophthalein retention, with normal cephalin-cholesterol flocculation and thymol turbidity tests. The most frequent causes of partial biliary tract obstruction without jaundice are space-occupying lesions within the liver. Elevation of the serum alkaline phosphatase level without jaundice has been reported in metastatic carcinoma.[1] Sulfobromophthalein retention has likewise been observed.[2] Gutman [1b] found the serum alkaline phosphatase level increased without jaundice in liver abscesses of varying etiology, and sulfobromophthalein retention, as well as an increased alkaline phosphatase level, has been described in amebic abscess of the liver.[3] Echinococcosis of the liver has been reported to produce elevation of the alkaline phosphatase level without jaundice.[4]

Liver Function Tests in Intrahepatic Lesions

* Icteric index.

MATERIAL AND METHOD

The results of the liver function tests in a group of patients with intrahepatic lesions are presented in the table. These patients were selected from a much larger group strictly on the basis of absence of jaundice and on the completeness of the liver function tests performed—not on the basis of their results. The presence of an intrahepatic lesion was established by clinical findings plus liver biopsy, laparotomy, autopsy, or response to specific therapy. Although hepatic enlargement was clinically evident in most patients, the liver was not palpable in cases 6 and 12 (see table). The required liver function tests were (1) quantitative serum bilirubin or icteric index; (2) cephalin-cholesterol flocculation; (3) thymol turbidity; (4) serum alkaline phosphatase (Shinowara's method)[5] in which a level of 9 units is said to be the upper limit of normal; and (5) a sulfobromophthalein test in which 5 mg. per kilogram of body weight is administered and the retention after 45 minutes determined.

RESULTS

Results of the cephalin-cholesterol flocculation test were normal in all but one patient (table, case 13). The results of the thymol turbidity test were likewise normal in most instances, cases 7 and 12 showing slightly abnormal values (see table). The alkaline phosphatase level was distinctly elevated in all but two patients (table, cases 10 and 12), and abnormal sulfobromophthalein retention was likewise present in all but two patients (table, cases 9 and 12). Although there was no consistent quantitative relationship between the degrees of abnormality of sulfobromophthalein retention and alkaline phosphatase activity, in most instances, when one was abnormal, the other was also. Patients in cases 9 and 10 (see table) were exceptions, however, in that one test was normal and the other abnormal in both patients.

COMMENT

The results of these tests in this group of patients indicate partial obstruction of the biliary tract without diffuse parenchymal disease. That the alkaline phosphatase test is more sensitive in determining obstruction than the serum bilirubin test was shown by Freeman, Chen, and Ivy,[6] who produced striking rises in the alkaline phosphatase level without increases in the serum bilirubin level by ligating a portion of the intrahepatic bile ducts in experimental animals. The most plausible explanation for this is that bilirubin, although returned to the blood after passing through the liver cells in the obstructed area, is easily excreted by the kidney and a normal serum level thus maintained, while phosphatase, which cannot be excreted by man and most animals, accumulates in the blood.[1b] The sulfobromophthalein test likewise will detect obstruction before the serum bilirubin level rises, since it is a loading test requiring a high degree of efficiency of hepatic parenchymal, as well as excretory, function in order that the dye be removed from the blood in the required time. Impairment of the excretory function, even though not sufficient to produce jaundice, may nevertheless result in sulfobromophthalein retention.

The degree of obstruction occasioned by the lesion determines whether or not the tests will be revealing. Few or small lesions will not be demonstrable. Hence, normal results on tests cannot be assumed to exclude the possibility of intrahepatic disease. When this pattern does occur, however, an intrahepatic lesion may be strongly suspected. Obscure affections of the right upper side of the abdomen or lower side of the thorax may be specifically identified as being within the liver. The routine use of the discussed tests in the evaluation of patients with known gastrointestinal neoplasms will in many instances provide valuable information obtainable in no other way short of surgery. The fact that one of the tests of obstruction may be normal and the other abnormal, as in cases 9 and 10 (see table), makes it desirable to employ both the sulfobromophthalein test and the serum alkaline phosphatase determination. Also, alkaline phosphatase activity may be affected by skeletal lesions, while sulfobromophthalein retention, of course, is not.

Parenchymal diseases of the liver such as cirrhosis frequently possess an obstructive element, with consequent elevation of the alkaline phosphatase level without jaundice.[7] The tests of parenchymal function will usually be abnormal, however. In order to differentiate partial biliary obstruction from hepatocellular disease, therefore, the tests of cellular function must be done and found normal. Like all other tests, these are not infallible and an occasional instance of cirrhosis or common duct stone may produce this pattern. Also, now and then, abnormal results in parenchymal tests will be found in cases of space-occupying lesions, as in case 13 (see table). When viewed in the light of the clinical findings, however, this group of liver function tests may be of great help in detecting obscure intrahepatic biliary obstructive lesions.

SUMMARY

Abnormal test results of biliary tract patency, that is, an elevated serum alkaline phosphatase level and sulfobromophthalein retention, in the presence of a normal serum bilirubin level and normal test results of parenchymal function such as the cephalin-cholesterol flocculation and thymol turbidity tests, are strong evidences of partial biliary tract obstruction. This pattern is usually seen in cases of space-occupying lesions within the liver. The concept of partial intrahepatic biliary tract obstruction and the means of its demonstration are very useful tools in the detection of otherwise obscure or confusing lesions within the liver.

CAUSALGIA TREATED WITH CHLORPROMAZINE HYDROCHLORIDE

C. Harwell Dabbs, M.D.
and
E. Converse Peirce II, M.D., Knoxville, Tenn.

We have recently used chlorpromazine (Thorazine) hydrochloride as the sole treatment in three early but typical cases of causalgia of the upper extremity with complete and dramatic remission of all symptoms of the causalgia. Insofar as we can determine these represent the first cases of causalgia treated primarily with this drug.

REPORT OF CASES

Case 1.—The patient, a 48-year-old white man, was in good health until Nov. 23, 1954, when he injured four fingers of the right hand while operating a pulley cable. He received penicillin, tetanus toxoid, and meperidine (Demerol) hydrochloride for pain soon after the accident. Inspection revealed traumatic amputation of the third and fourth fingers through the distal interphalangeal joint, traumatic amputation of the fifth finger at the level of the midportion of the distal phalanx, and an injury to the index finger consisting of a severe abrasion of all of the epidermis on its radial side and a deep undermining laceration on the radial side at the level of the proximal interphalangeal joint extending down to the lateral ligaments of the joint but not into the joint space. The patient was taken promptly to the operating room, and, under general anesthesia, the wounds were débrided. The three amputated fingers were carefully reamputated to secure satisfactory skin flaps. The digital nerves were transected but not ligated, a few vessels were ligated with 000000 plain catgut, and the skin was closed with 0000 dermal nylon. The patient was treated with penicillin and streptomycin and, except for some edema about the sutures and the moderate amount of tenderness of the fingers, the postoperative period was essentially uneventful. There was no sepsis of the wound. He was followed at frequent intervals as an outpatient. The wounds healed with some spreading of the incision following early active exercises under running hot water at home. Since he appeared to have some residual stiffness, even on this regimen, on Dec. 15, 1954, he was started on therapy with daily paraffin baths and assistive exercises in the department of physical medicine. With this motion of the hand improved considerably, and on Dec. 27, he was released for work. He returned on Jan. 1, 1955, complaining that he was unable to work because of pain in the stumps of the fingers on manipulation of levers. It appeared that during the preceding week or 10 days he had developed, for the first time, a severe pain whenever the tips of the finger stumps were touched lightly. It radiated up into the forearm as far as the elbow but did not follow the characteristic course of any of the sensory nerves. It was of a diffuse but severe burning nature. This pain was also experienced on exposure of the hand to cold. Firm palpation of the stumps of the fingers revealed little tenderness and did not reproduce pain. Light touch, especially stroking, of the ends of the fingers caused the patient to have paroxysms of pain and to "guard" his hand quite characteristically. He also stated, at this time, that he had had to change his sleeping habits, keeping his hand outside the cover to avoid it being brushed lightly by the sheet. It was thought that the patient had an early but typical case of causalgia, and he was presented for discussion at the Acuff Clinic staff conference. The diagnosis of causalgia was concurred in, and it was suggested that before sympathetic blocks were tried, the patient be treated with chlorpromazine hydrochloride. Therapy was started on Jan. 7, in a dosage of 25 mg. four times daily. The patient was seen again on Jan. 14. He had been dramatically and completely relieved of all symptoms referable to the causalgia. There was still the same slight tenderness of the stumps of the fingers on firm pressure but light touch was no longer painful. Chlorpromazine therapy in the same dosage was main-

tained for three weeks, following which time it was discontinued. The patient returned to his job in the meanwhile and continued to work with no symptoms. He has been followed periodically since that time and has developed no evidence of recurrence of the causalgia.

Case 2.—A 51-year-old white man sustained a crushing injury to the left hand on Dec. 29, 1954. The skin was lacerated approximately three-fourths the circumference of the thumb, being incomplete only on the radial aspect. There was complete anesthesia of the distal portion of the thumb with a compound comminuted fracture of the proximal phalanx. The flexor and extensor tendons were intact. The wound was thoroughly cleansed, and the soft tissue was sutured under local anesthesia. The thumb was splinted, and the patient was treated with antibiotics and antitetanus serum. He was hospitalized because of severe pain and maintained on antibiotics in the hospital. On the fourth day following the injury a small wire was inserted into the distal phalanx of the thumb and traction was applied in the axis of the finger. The patient had some seropurulent drainage from the wound postoperatively and also some generalized edema of the hand and base of the thumb. The cast and pin were removed on Jan. 24, 26 days following the injury, and at that time x-rays showed good early callus formation with clinical stability of the fracture. The patient had had some residual pain and tenderness in the thumb consistently but not out of proportion to the nature of the wound. About Jan. 17, the patient began having a different type of pain in the wound. Touching the tip of the finger to an object lightly, he stated, was like touching a red hot stove. The pain radiated as high as the elbow and was of a severe, burning character. It was particularly brought on by light touch. Firm pressure on the finger did not cause pain or tenderness. The patient sought to protect the hand at all times from being touched by any object and protected it from exposure to the cold by wearing a piece of cloth over it. He had also noted that the pain was set off or aggravated by loud noises and by nervous tension occasioned by the children playing around the house. It was thought that this was a typical causalgia reaction to the injury, and he was given chlorpromazine, 25 mg. a day for two days and thereafter increased to 25 mg. four times daily. He was given no other medicaments of any kind. The patient was completely relieved of the causalgic type pain after two days of chlorpromazine therapy. At the present writing the patient has been followed 36 days and has had no further evidence of the causalgia.

Case 3.—A 34-year-old white man sustained a crushing injury to the left wrist on Jan. 17, 1955. He had had no previous injury to the wrist and was seen in the Acuff Clinic soon after the injury. Examination at that time revealed superficial abrasions of the left wrist and a moderate amount of edema and tenderness over the wrist. X-rays were made, and the conventional views showed no abnormalities of the bone. The following day there was a severe degree of swelling of the left hand and wrist and the tenderness was more marked. Further x-rays were obtained, and a slight irregularity of the basilar portion of the fourth metacarpal bone was seen, suggesting an incomplete fracture. It was decided to treat the patient as though he had a fracture, and his hand and wrist were immobilized in a splint. The edema subsided satisfactorily, and the acute pain from the trauma also subsided in a few days so that it was felt he was making a satisfactory course. At one of his regular visits on Jan. 31, 1955, however, it was noted that he was complaining of more pain than usual. He stated for the first time that he had radiating pain beginning in the third and fourth fingers and shooting up the forearm to the anterior left chest. The pains would come on without motion and were very short in duration. He described them as "shooting pains." He had also been increasingly nervous since the onset of this pain and bothered by activity in the shop where he worked and by his children and in general had been quite upset for some reason. He had noted that the pain was greatly aggravated by cold. Examination on that day revealed good color in the fingers; sensation was essentially normal. There was considerable tenderness over the base of the metacarpals. There was pain on motion of the wrist in all directions. The patient held his hand in a fixed position without motion. There was no obvious attempt to protect it. It was felt that this, while not absolutely typical, was quite suggestive of an early causalgia and, in view of previous good results with chlorpromazine, it was decided to institute this therapy. Accordingly he was started on chlorpromazine therapy, 25 mg. daily initially with a gradual increase to 100 mg. daily, providing he had no ill-effects. He was given no other medicaments. On this regimen he improved remarkably in four days time. Four days after the institution of this therapy he was no longer having any significant pain in his wrist at all and was able to discard his splint. He was much less nervous, and the pain was not precipitated by noises. Chlorpromazine therapy was continued for two weeks, following which time it was discontinued, and he has had no further difficulty with the wrist suggestive of causalgic pain.

COMMENT

The first patient described had been seen previously for injury at the Acuff Clinic, and it was the impression of all examiners who had treated him that he was a stable individual with little or no tendency toward neurotic behavior in general. He tolerated the initial period of disability quite well, and it was not until he developed the causalgia that he began to show any personality changes at all. This personality change was not discovered until after he had received relief with chlorpromazine, when he volunteered the information that the pain had become so great that even the children playing at home would "get on his nerves" and aggravate the pain. This phenomenon in the causalgic state has been described repeatedly previously. It should also be emphasized that the patient was given no drugs of any kind during the trial of chlorpromazine and had not had previous sympathetic blocks. Moreover the physiotherapy was discontinued during the time of the trial of the drug. Similarly, the second and third patients described had been seen previously, and they have also been followed subsequently after the relief of the causalgic pain. There was nothing in either of these cases to suggest that the complaints were on a psychiatric basis.

Causalgia can be and frequently is a severe disabling disorder. Sympathetic block and high thoracic sympathectomy in the past have been the procedures of choice in treating it, and it has been repeatedly emphasized that treatment should be instituted early.[1] The dramatic and complete relief of this symptom following the use of chlorpromazine leads us to the conclusion that this drug warrants further study as the initial treatment for causalgic states.

Many theories as to the mechanism of the pain in causalgia have been advanced. The theory that appears more nearly to fit the observed phenomena is that sympathetic discharges originating in the midbrain are short-circuited into sensory nerves because of some obscure change that has taken place in the peripheral nerves as a consequence of the injury. The phenomenon of aggravation of the pain by emotional stimuli, loud noises, and excitement, which is well documented in cases of causalgia, fits this hypothesis well.[2] It was on this basis that the thought of a trial of chlorpromazine therapy occurred to us, since its action is at the central level. The response that these patients exhibited lends credence to this theory.

SUMMARY AND CONCLUSIONS

Three patients with early cases of causalgia following injuries to the upper extremity have been treated primarily with chlorpromazine (Thorazine) hydrochloride, with complete and dramatic relief. We believe that further trial of chlorpromazine in the treatment of causalgic states is warranted. If consistently good results are obtained under these circumstances, it would appear that a significant link has been added to the chain of evidence that the essential lesion in causalgia is central rather than peripheral.

SPECIAL ARTICLE

SOME OBSERVATIONS ON THE EPIDEMIOLOGY OF CANCER IN THE UNITED STATES

John R. Heller, M.D.
Sidney J. Cutler, M.A.
and
William M. Haenszel, M.A., Bethesda, Md.

When the National Cancer Institute was established as a unit of the Public Health Service in 1937 no information was available on the distribution of cancer morbidity in the population of the United States. Records of individual clinics and hospitals contained valuable information on the occurrence and treatment of cancer, but they could not be related to a population base to determine the frequency of occurrence within various subgroups of the population, which is the essence of the epidemiological method. Mortality statistics are inadequate for this purpose. Some types of cancer are more lethal than others; contrast, for example, carcinoma of the lung with carcinoma of the skin. Consequently, conclusions drawn from mortality and morbidity records will differ, not only as to frequency of the disease but also as to the tissues or organs involved.

To obtain the required data for delineating the cancer problem in the United States, the National Cancer Institute initiated in 1938 a series of cancer morbidity surveys in 10 metropolitan areas, representing different geographical regions of the United States; these were, in the North, Chicago, Detroit, Philadelphia, and Pittsburgh; in the South, Atlanta and Birmingham, Ga., Dallas, Texas, and New Orleans; and in the West, Denver and San Francisco. These same areas were resurveyed in 1947 and 1948. At the time of the resurvey the population covered was 14,600,000, approximately 10% of the total and 15% of the urban population of the United States. The 10 areas selected were believed to have superior medical and hospital facilities reasonably accessible to all groups of the population, thus minimizing the risk of understating the number of cancer cases because of underdiagnosis.[1]

The information collected on each diagnosed case was relatively simple and included date of diagnosis; age, sex, and race of patient; site of tumor origin; histological type; stage at diagnosis; method of confirmation of diagnosis; and length of patient's hospital stay. The value of these data lies not in consideration of minute clinical detail but in reconstructing the broad pattern of cancer incidence. Contrary to the practice of some investigators, the analysis was not restricted to cases with microscopically confirmed diagnoses (77% of all reported cases). Whether or not a specific diagnosis is confirmed by microscopic examination depends on a variety of factors, including the accessibility of the tissue affected. Consequently, microscopically confirmed cases represent a selected segment of all diagnosed cases and may be unrepresentative of all cases in the population with respect to factors such as primary site, stage at diagnosis, and age of the patient. If the data are restricted to a selected series of cases, generalization to the total population from which they were drawn becomes very risky. In characterizing the cancer experience of a population, it is preferable to include all diagnosed cases and accept the possibility that a few cases are incorrectly classified.

The magnitude of the data collection process was on a scale unrivaled in any other country and could not have been undertaken without the wholehearted support of state and county medical societies. Special acknowledgment is due the thousands of individual physicians who generously contributed information concerning their patients. It is heartening to realize that such studies may be undertaken within the framework of the American system of medical care without breaching the traditional physician-patient relationship.

MAGNITUDE OF THE PROBLEM

Illness Rates.—To measure the frequency with which cancer occurs, the number of diagnosed cases must be related to the population from which they are drawn, through the computation of rates per unit of population. Incidence was defined as the number of cases first diagnosed during the study year, per 100,000 population; prevalence as the number of persons known to have had cancer at any time during the year, per 100,000 population; and mortality as the number of deaths during the year for which the primary cause of death was cancer, per 100,000 population. In 1947, out of every 100,000 residents of the 10 survey areas, 430 had cancer at some time during the year, in 319 cancer had been newly diagnosed, and 149 died of cancer. (For simplicity, 1947 is used to identify the 1947-1948 survey data and 1937 to identify the 1937-1939 data.) Compared with 1937, the prevalence rate was 26% higher, the incidence rate was 30% higher, and the mortality rate was 19% higher. Adjustment for the changed age composition of the population indicates a residual increase in reported illness from cancer of 10% for prevalence, 14% for incidence, and 3% for mortality (fig. 1). Leukemia and Hodgkin's disease were not reported in 1937 and are excluded from the data shown in figure 1. The rates for 1947, including these two types of neoplasms, are given in table 1.

From the National Cancer Institute, U. S. Public Health Service, Department of Health, Education, and Welfare.

[1] Dorn, H. F., and Cutler, S. J.: Cancer Morbidity in the United States: I. Variation in Incidence by Age, Sex, Race, Marital Status, and Geographic Region, Public Health Monograph 29, U. S. Department of Health, Education, and Welfare, Public Health Service, 1955.

It is difficult to assess the significance of the computed increase in cancer morbidity and mortality, or to determine how much of the rise is real. Improved techniques for diagnosis have resulted in the discovery of some cases that in the past would have been missed. The number of physicians with training and experience in the diagnosis of cancer has also increased. Improved economic conditions in 1947 compared to 1937 may also have contributed. People are more likely to obtain adequate and specialized medical care during economic prosperity than during a depression period.

When adjustment is made for age, it appears that cancer is being discovered at the same rate among members of the two sexes. In 1947, the age-adjusted incidence rate for males was 331 per 100,000 and for females 330 per 100,000. In contrast, deaths due to cancer occurred at a rate of 169 per 100,000 among males, compared with a rate of 147 for females. These relationships between the incidence and mortality rates indicate that the case survival rate is lower among males. This is due mainly to the fact that a larger proportion of the cancer occurring in males originates in inaccessible sites and has a poor prognosis, such as stomach and lung cancer.

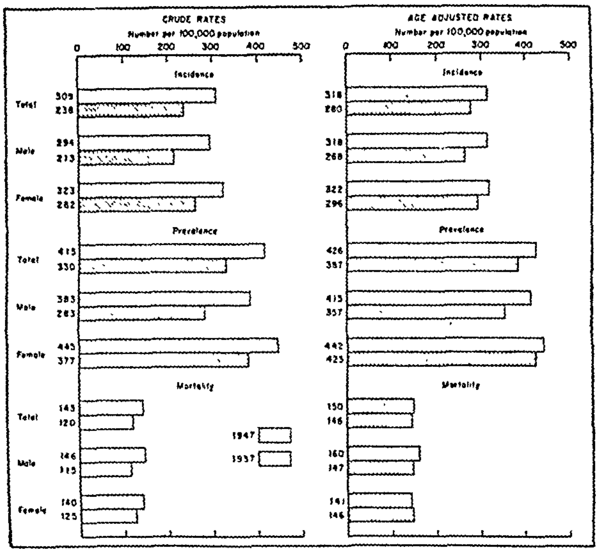

Fig. 1.—Cancer incidence, prevalence, and mortality rates per 100,000 population, by sex, 1947 and 1937.

TABLE 1.—*Cancer Incidence, Prevalence, and Mortality Rates, Including Leukemia and Hodgkin's Disease, 1947*

	Crude Rates			Age-Adjusted Rates		
	Incidence	Prevalence	Mortality	Incidence	Prevalence	Mortality
Total	319	430	149	328	441	156
Male	305	401	154	331	433	169
Female	331	458	145	330	455	147

Reported illness from cancer was substantially lower among nonwhite persons than among white. In 1947, cancer was diagnosed at a rate of 272 per 100,000 among nonwhites compared to a rate of 333 for whites (fig. 2). A large portion of this difference is due to the low incidence of skin cancer among nonwhites. When skin cancers are excluded, it becomes apparent that cancer is being diagnosed at about the same rate in white and nonwhite females. On the other hand, although exclusion of skin cancer brings the cancer incidence rates for white and nonwhite males closer together, the nonwhite rates remain 14% lower. Except for cancer of the skin, there is no reason to believe malignancies actually occur less frequently in nonwhite males. More likely a sizable proportion of cancer among nonwhite males remains undiagnosed.

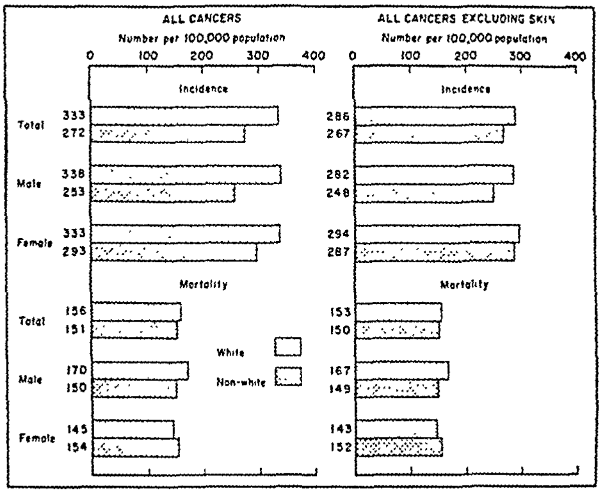

Fig. 2.—Age-adjusted cancer incidence and mortality rates per 100,000 population, by sex and color, 1947.

Cancer illness rates increase rapidly during adult life and old age. For example, the incidence rate is about 40 per 100,000 at age 25, 475 per 100,000 at age 50, and 1,900 per 100,000 at age 75. The trend, with respect to age, for cancer prevalence and mortality is essentially the same as for incidence. Although cancer morbidity and mortality generally increase with age, there is a reversal during the early years of life. The illness rates for children under 5 years of age are higher than for children between the ages of 5 and 15 (fig. 3).

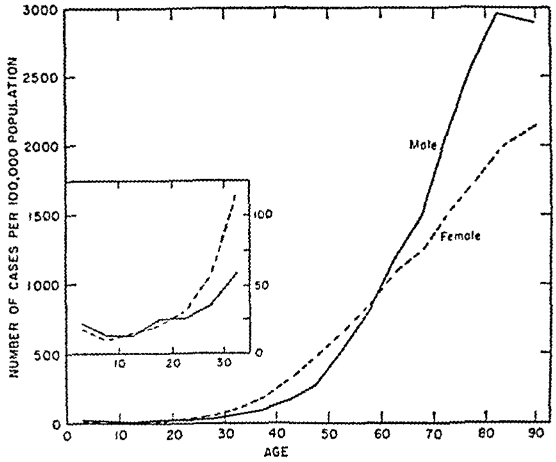

Fig. 3.—Cancer incidence rates by age and sex, 1947.

It was previously indicated that cancer is being discovered at the same rate among members of both sexes. This is not true throughout the life span. Among children under 10 years of age, the incidence of cancer is somewhat greater among males than females. From age

20 to about age 60, the incidence of cancer is higher among females. Among persons between the ages of 25 and 45 the rate in women is approximately twice that in men. The relatively high rate for women during early adult life is accounted for by the larger number of malignancies of the genital organs and breast. Cancers of the female genital organs and breast develop in persons of younger ages than the predominant forms of cancer among males. From about age 60 on, the incidence rate for males is higher than for females, and the difference increases with age.

Estimated Number of Cases.—The age-specific cancer illness rates provide a basis for estimating the number of cases of cancer in the United States and for making forecasts. Estimates for 1950 and forecasts through 1975 are given in figure 4. These estimates were made on the assumption that the age-specific rates observed in the surveyed metropolitan areas in 1947 are applicable to the total population of the United States from 1950 through 1975. This procedure may overstate the number of cases for 1950, because current evidence suggests that reported cancer illness is higher in urban than rural areas. (The number of registered cancer deaths in the United States in 1950 was 10% lower than the number expected on the basis of the cancer mortality rates in the 10 metropolitan areas.) The forecasts, however, are likely to be conservative, because past experience indicates that the rates of cancer illness are likely to continue increasing. Even if the current rates prevail, the number of persons affected by cancer will increase by more than 50% during the next 25 years, since both the total population of the United States and the proportion of persons in the older age groups are expected to increase.

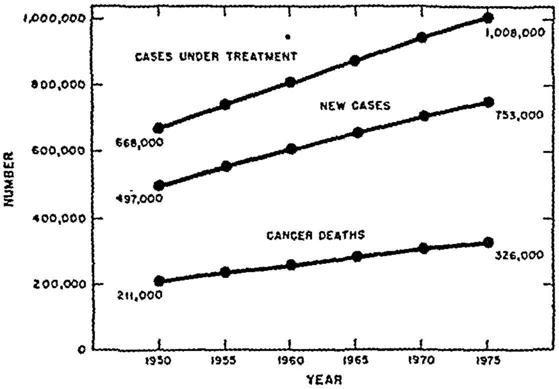

Fig. 4.—Estimated number of cases of cancer and deaths due to cancer, United States, 1950-1975.

Lifetime Probability of Developing Cancer.—Though annual incidence and mortality rates are the basic tools for describing the frequency with which this disease occurs, they are likely to be of slight interest to the individual. An individual may not be too greatly interested in the probability of developing cancer within the next year. He is usually more concerned with the chances of developing cancer between his present age and the close of his working career, at 65 or 75 years of age. This type of information is also of interest to the physician, because it provides a summary measure of the importance of a particular disease as a medical, social, and economic problem. The probability of developing cancer during various intervals of the lifespan may be computed by standard actuarial methods that need not be elaborated on here.

Under prevailing conditions of mortality from all causes and of cancer incidence, 32 out of every 100 newborn children may be expected to develop cancer at some time during their lives. The risk of developing cancer during the early part of the lifespan is quite low—3 out of 100 newborn children may be expected to develop cancer by age 45. Conversely, the risk of developing cancer during old age is high. Among persons surviving to age 65, 26 in 100 may be expected to develop cancer during their remaining years of life (table 2). It is of utmost importance for the physician to keep the possibility of cancer in mind in dealing with elderly patients.

TABLE 2.—*Percentage of Persons Expected to Develop Cancer During Future Lifetime**

	Beginning at		
	Birth	Age 45	Age 65
By age 20	0.3	..	..
By age 45	3	..	..
By age 65	14	13	..
By age 75	23	23	13
During future lifetime	32	32	26

* Based on cancer incidence rates in 10 metropolitan areas in 1947 and the 1950 United States life table.

Women are more likely to develop cancer sometime during their lives than men; white persons are more likely to develop cancer than nonwhite persons (table 3). These differences result from the interplay of two factors: the risk of developing cancer during successive age intervals and the average number of years persons in each color-sex group can expect to live. Although the cancer incidence rate for white men is slightly higher than for white women, 31% of newborn white male children are expected to develop cancer during their lifetime, compared with 36% of newborn white female children. The difference is due primarily to the fact that white women can expect to live an average of 72.4 years, compared to 66.6 for white men.

TABLE 3.—*Lifetime Probabilities of Developing Cancer, Age-Adjusted Cancer Incidence Rates, and Average Life Expectancy, by Color and Sex*

Color and Sex	Lifetime Probability of Developing Cancer, %	Age-Adjusted Cancer Incidence Rates *	Average Life Expectancy, Yr.
White men	31	338	66.6
White women	36	333	72.4
Nonwhite men	17	253	59.2
Nonwhite women	22	293	63.2

* Per 100,000 population.

The probabilities, for white men and women, of developing cancer at various sites are given in table 4. In men, the risk of developing cancer of the digestive system is dominant, with a lifetime probability at birth of 10.3 in 100. In women, the risk of developing cancer by age 65 is highest for the genital organs and breast. However, the risk of developing cancer of the digestive system after age 65 increases so rapidly that the digestive system outranks the genital organs and breast as a cancer risk in over-all lifetime probability. In both men and women, the probability of developing cancer of the digestive system from age 65 on is substantial, 9.9 per 100 men and 8.4 per 100 women aged 65. It is of interest to note that the probability of developing leukemia during childhood (by age 15) is less than 1 in 1,000 for both male and female children.

It is obvious that the probability of surviving to a specified age is affected by the risk of dying from cancer. Further insight into the magnitude of the cancer problem may be gained by determining the effect of cancer mortality on life expectancy. It has been estimated that persons currently dying of cancer would live an average of 15 years longer if cancer were eliminated as a cause of death.[2]

SITES OF CANCER ORIGIN

Variation by Sex.—Although the incidence of cancer is essentially the same in the two sexes, there is a marked difference by site of origin. In females, nearly one-half of all cancer originates in the reproductive organs (breast and genitals) and nearly one-fourth in the digestive system. Among males, only one cancer in eight originates in the reproductive organs, while one-third originate in the digestive system. Nearly all forms of cancer, other than cancer of the reproductive organs, occur more frequently among males. If genital and mammary cancer are excluded, the incidence rate per 100,000 becomes 290 for males and 181 for females, or 60% greater among males. The largest excess is found for cancer of the respiratory system. Cancer of the lung and bronchus occurs four and one-half times as frequently in males, and the incidence of laryngeal cancer is 12 times as high.

The sex difference in susceptibility to cancer of the reproductive organs may arise from differences in function and structure. The more frequent development of nearly all other forms of cancer in males may in large part be due to exogenous factors. Men are exposed to some environmental factors to which women generally are not subjected, and exposure to common etiological agents may be more prolonged or intense for males. The environmental hypotheses seem to be supported by the fact that for most forms of cancer other than genital and mammary the gap between the incidence rates for males and females increases with age. However, the possible role of endogenous factors in the etiology of cancer of the nonreproductive organs should not be overlooked. The higher incidence of cancer among male children cannot readily be attributed to environmental factors. Incidence rates by sex and primary site, for white and nonwhite persons, are given in table 5.

Variation by Race.—The most striking contrast between whites and Negroes is the difference in incidence for cancer of the skin and genital organs. Whereas the skin accounts for one in seven cancers in white persons, skin cancer is relatively rare in Negroes. Among males, the incidence of cancer of the prostate and penis is definitely higher for Negroes, whereas testicular cancer occurs more frequently in whites. Among females, the higher rate of genital cancer in Negroes is due entirely to cancer of the cervix, which occurs twice as frequently in Negro women. Cancers of the corpus, vagina, and vulva occur with equal frequency in both races, while cancer of the ovary occurs more frequently among whites.

The low incidence of skin cancer in Negroes is generally considered to result from a true racial difference in susceptibility. The higher incidence of cancer of the prostate, penis, and cervix in Negroes has been attributed to sex habits and sex hygiene, the prevalence of veneral disease, pregnancy history, and medical care at parturition. However, the available evidence is insufficient to establish the precise importance of any of these factors.

TABLE 4.—*Percentage of White Persons Expected to Develop Cancer During Future Lifetime, Broad Site Groups by Sex and Age*

* The estimates for the respiratory system are undoubtedly too low. They are based on current incidence rates, and experience indicates that the incidence of respiratory cancer is likely to continue to increase during the next few decades.

Changes from 1937 to 1947.—The outstanding change between the two survey periods was the large reported increase in illness from cancer of the lung and bronchus. Both the incidence and mortality rates more than doubled in a period of 10 years (table 6). Part of the increase may be due to improved case finding. It seems unreasonable, however, to attribute all of the observed increase to this factor. The differential rate of increase between 1937 and 1947 in the two sexes (males, 119%; females, 67%) argues against this conclusion. At least part of the reported increase in lung cancer incidence and mortality is real.

---

[2] Effect of Cancer on Longevity: United States, 1939-41, Vital Statistics Special Reports 32, no. 7, Public Health Service, National Office of Vital Statistics, 1950, pp. 239-242.

A sizable decrease (24%) was reported in the incidence of cancer of the stomach. This decrease must be interpreted in the light of reported increases for other parts of the digestive system, which resulted in an unchanged incidence rate for the digestive system as a whole. This suggests a shift in the site classification of cancers originating in the digestive system rather than a real change for specific sites. It is possible that some cases of cancer that in 1937 were considered to be primary in the stomach on clinical evidence alone, in 1947 would have been classified as primary in the intestines, as a result of x-ray, exploratory surgery, or biopsy.

TABLE 5.—*Age-Adjusted* Cancer Incidence Rates per 100,000 Population, Broad Site Groups and Selected Individual Sites by Color and Sex, 1947*

* Adjusted on age distribution of the population of the United States (continental) in 1950.

For a number of site groups, the relationships between changes in the incidence and mortality rates suggest that some progress has been made in the management of the cancer problem. The sites involved and the changes in cancer incidence and mortality from 1937 to 1947 are shown in table 7. The observed differential trends may have resulted either from earlier case finding or from more successful treatment. An alternative explanation, that in 1947 a greater proportion of the reported cases of cancer were in fact nonmalignant, seems unlikely in view of the increased utilization of microscopic techniques for the confirmation of cancer diagnoses. The suggestion that there has been improved case management requires verification. This might be accomplishd through the analysis of trends in case survival rates.

TABLE 6.—*Age-Adjusted* Cancer Incidence and Mortality Rates, 1947, and Percentage of Change, 1937 to 1947, by Primary Site*

	Incidence		Mortality	
Primary Site	Cases per 100,000 Population, 1947	Change 1937-1947, %	Deaths per 100,000 Population, 1947	Change 1937-1947, %

Urinary organs	+16	— 8
Male genitals	+16	— 2
Buccal cavity	+12	+ 2

PATTERN OF MEDICAL CARE

In addition to information on the distribution of different forms of cancer in the population, the morbidity surveys provide some insight into the pattern of medical care given to persons with cancer. These data include (1) proportion of persons with cancer receiving hospital care, (2) length of hospitalization, (3) proportion of cases in which diagnosis is microscopically confirmed, (4) stage at diagnosis, and (5) survival experience.

Hospitalization.—Of every 100 patients with cancer under care in 1947, 73 were seen in a hospital, compared to 68 in 100 in 1937—an increase of 7%. The average period of first hospitalization was 23 days. Since a sizable proportion of patients with cancer are hospitalized more than once, the total number of days of inpatient care received by the average patient is considerably greater than 23, probably at least 30. This represents a serious drain on the financial resources of the patient and his family and on the hospital resources of the community.

Table 8.—*Number of Survivors in Every 100 Diagnosed Cases of Cancer, by Stage at Diagnosis*

Stage at Diagnosis	National Cancer Institute Survey, Yr.	Connecticut, Yr.*		
	1	1	5	10
All stages	64	54	27	16
Localized	84	72	43	26
Regional involvement	58	50	20	11
Remote metastases	28	14	8	1

* The Connecticut register is restricted to patients seen in hospitals. At least part of the difference in the 1 yr. survival rates in the National Cancer Institute survey and the Connecticut register may be attributed to the selection of cases for hospitalization.

Microscopic Confirmation of Diagnoses.—In 72 out of every 100 cases of cancer discovered in 1947, the diagnosis had been confirmed by microscopic examination of tissue, compared to 61 out of every 100 in 1937—an 18% increase. This rise in the proportion of microscopically confirmed diagnoses indicates improvement in the quality of medical care. Whether the diagnosis of cancer is confirmed by a microscopic examination of tissue depends in part on the accessibility of the tissue affected, especially for living patients (fig. 5). In 1947, the site groups with the highest proportion of cases microscopically confirmed were female genitals (84%), breast (83%), lymphoma (83%), and buccal cavity (81%). Except for the parts of the body attacked by lymphoma, these sites are generally accessible. Although the skin is the most accessible of all sites, only two-thirds of the cases of cancer at this site were confirmed microscopically. The ease with which growths on the skin may be removed accounts for the fact that one-third of the diagnoses were based on clinical evidence alone.

Table 9.—*Cancer Sites Accessible to Direct Examination, Percentage of Cases Diagnosed While Localized, by Sex, 1947*

Men			Women		
Primary Site	Percentage of All Newly Diagnosed Cases	Percentage Diagnosed While Localized	Primary Site	Percentage of All Newly Diagnosed Cases	Percentage Diagnosed While Localized
Skin	15.4	94	Breast	21.7	40
Prostate	9.5	50	Uterus	18.9	57
Rectum	6.5	45	Skin	10.7	95
Mouth and pharynx	6.3	61	Rectum	4.5	46
			Mouth and pharynx	2.0	74
Thyroid	0.3	49	Thyroid	1.1	65
Total accessible sites	38.0	70	Total accessible sites	58.9	58
Total accessible sites (excluding skin)	22.6	52	Total accessible sites (excluding skin)	48.2	49

There was a marked difference in the proportion of confirmed diagnoses among patients seen in a hospital and patients seen only by a physician. Nearly four out of five hospitalized patients had a microscopically confirmed diagnosis, compared with one out of every two patients whose condition was diagnosed outside of a hospital. Even cancer of the skin, if diagnosed in a hospital, was microscopically confirmed almost as frequently as cancer of other accessible sites.

Stage at Diagnosis and Survival.—Early diagnosis of cancer is generally recognized to offer the most hope for successful treatment. This principle of cancer control is supported by data collected through follow-up of patients with cancer. Information on the survival experience of patients with cancer with respect to the stage of development of the cancer at the time it was diagnosed is contained in table 8. The data are drawn from the cancer register maintained since 1935 by the state of Connecticut as well as from the surveys conducted by the National Cancer Institute. Each series is based on the experience of more than 40,000 patients.

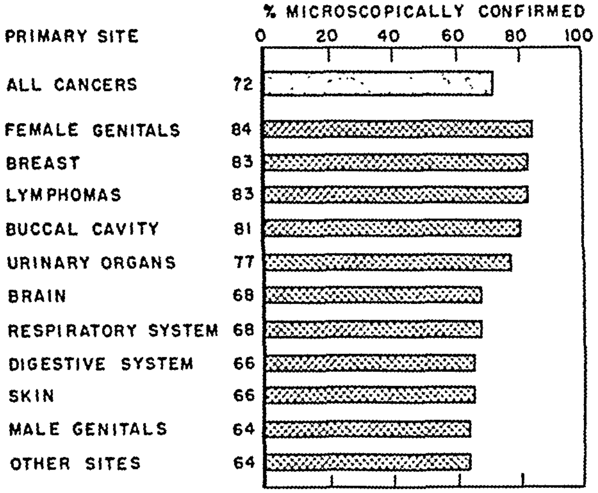

Fig. 5.—Percentage of newly diagnosed cases of cancer with microscopic confirmation of diagnosis by primary site, 1947.

Table 8 indicates that the chances for survival in cases of cancer diagnosed while localized at the site of origin are much better than for cases diagnosed after the tumor has spread to adjacent tissues (regional involvement) or to other organs (remote metastases). For example, of every 100 persons in whom a diagnosis of localized cancer was made, 43 lived for at least five years after diagnosis, whereas of every 100 persons in whom a diagnosis was made after other organs had been invaded, only 3 survived five years. In view of the evident benefits of early diagnosis, it is unfortunate that only one-half of all cases of cancer are being diagnosed while localized at the site of origin. This record could be improved materially, because one-half of all forms of cancer develop in organs accessible to direct examination by the physician in his own office. When skin cancer, which generally does not spread to other organs, is excluded, only 50% of accessible cancer was diagnosed early. The record of each accessible site with respect to the percentage of cases diagnosed while localized is shown in table 9. Noteworthy here is that in cancer of the breast—a highly accessible site—only two of every five cases are diagnosed while the cancer is localized. For cancer of the rectum, the proportion is less than half; for cancer of the prostate one-half; and for cancer of the uterus less than three out of five.

SUMMARY

Cancer morbidity surveys were carried out by the National Cancer Institute in 10 metropolitan areas of the United States in 1937 and again in 1947. The reported cancer incidence rate in 1947 was 319 per 100,000 population; 30% higher than in 1937. More than 500,000 new cases of cancer are being diagnosed in the United States each year; this number will increase to more than 750,000 by 1975. Under prevailing conditions, 32 out of every 100 newborn children may be expected to develop cancer at some time during their lives; 3 by age 45, 14 by age 65, and 23 by age 75. For a number of sites of cancer origin, the data suggest that some progress has been made in the management of the cancer problem. Further substantial advances are within reach through fuller utilization of available techniques. Half of all forms of cancer originate in organs accessible to direct examination by the physician in his own office; yet exclusive of skin cancer, only 50% of cancer developing in accessible sites is being diagnosed while it is localized at the site of origin.

COUNCIL ON PHARMACY AND CHEMISTRY

NEW AND NONOFFICIAL REMEDIES

Monographs and supplemental statements on drugs that appear in this column have been authorized by the Council for publication and inclusion in New and Nonofficial Remedies. They are based upon the evaluation of available scientific data and reports of investigations.

H. D. KAUTZ, M.D., *Secretary.*

Dermatological Preparations of Antibiotics

Until recently the Council has withheld recognition of dermatological preparations of the antibiotics, chloramphenicol, chlortetracycline hydrochloride, erythromycin, oxytetracycline hydrochloride, and tetracycline hydrochloride, pending the accumulation of sufficient experience to weigh their efficacy for topical management of pyogenic skin infections against their potentiality for producing skin sensitization reactions on repeated application. This problem previously led the Council to withhold its recognition of a dermatological ointment of streptomycin sulfate and to withdraw the earlier recognition of various topical forms of the sulfonamides and of penicillin (Sulfonamides for Local Application Deleted from N. N. R., *J. A. M. A.* **135**:157 [Sept. 10] 1947; Penicillin Preparations for Topical Application Omitted from N. N. R. in Annual Reprints of Reports of the Council on Pharmacy and Chemistry, Philadelphia, J. B. Lippincott Company, 1950, pp. 39-40). On the other hand the Council has recognized the topical use of bacitracin, neomycin sulfate, polymyxin B sulfate, and tyrothricin on the basis that these antibiotics exhibit a low index of sensitization and, in contrast to the sulfonamides, penicillin or streptomycin, are employed less often for systemic action in serious infections where sensitivity to them might prevent their use.

The Council recently reopened its evaluation of dermatological forms of the newer antibiotics in relation to the question of local sensitivity reactions on the basis of further experience as indicated by interested manufacturers and the opinions obtained from consultants in dermatology. The data from manufacturers as well as the experience of 11 leading dermatologists revealed that the continued topical use on the skin of an ointment or cream containing 10 mg. per gram of erythromycin, 1% chloramphenicol, or 3% chlortetracycline hydrochloride, oxytetracycline hydrochloride, or tetracycline hydrochloride was associated with a relatively low index of sensitivity reactions, which apparently is somewhere between that of the bacitracin-neomycin-polymyxin group and the penicillin-streptomycin group. In some instances sensitization could be traced to the vehicle rather than the antibiotic. The consultants also agreed, however, that promiscuous use of erythromycin and the broad spectrum antibiotics for topical treatment of pyogenic skin infections should be avoided and often was not required in view of the topical effectiveness of other antibiotics less frequently employed for systemic infections. Continued topical application increases the possibility of systemic allergic reactions.

The Council voted to recognize the discriminate use of dermatological preparations of chloramphenicol, chlortetracycline hydrochloride, erythromycin, oxytetracycline hydrochloride, and tetracycline hydrochloride for the topical treatment of pyogenic infections of the skin and to expand the New and Nonofficial Remedies monographs on these antibiotics accordingly.

Lederle Laboratories Division, American Cyanamid Company; Eli Lilly & Company; Parke, Davis & Company; and Pfizer Laboratories, Division of Chas. Pfizer & Co., Inc., cooperated by furnishing scientific data to aid in the evaluation of dermatological preparations of antibiotics.

Use of Methoxamine Hydrochloride in Shock Accompanying Myocardial Infarction

The Council has evaluated the proposed use of the vasopressor drug, methoxamine hydrochloride, in the management of hypotensive shock accompanying myocardial infarction. The drug previously was found useful as an adjunct to other appropriate measures for restoring blood pressure during surgery, especially with spinal anesthesia and in hypotensive, poor-risk patients. For evaluating its use in myocardial shock, the manufacturer furnished available reports of investigations. The Council also sought the opinions of consultants on the question of its usefulness for this purpose because of the lack of direct inotropic (muscle stimulant) effect on the heart. It was conceded, however, that this should not be construed as a disadvantage because peripheral vasoconstrictors such as methoxamine, which do not directly stimulate cardiac output but which increase peripheral resistance, might well interrupt the vicious cycle of cardiogenic shock by elevating systemic blood pressure and consequently the perfusion pressure of the coronary circulation. Accordingly the Council concluded that, although the available evidence for the use of methoxamine for this purpose was scanty and indicated that it may be less effective than cardiotonic vasopressor agents, the drug has produced benefit in a certain proportion of patients with myocardial shock. The Council also agreed that the use of such agents in this condition is mainly indicated when shock is not so severe that the blood pressure cannot be detected.

The Council voted to expand the monograph on methoxamine hydrochloride in New and Nonofficial Remedies to recognize its additional use as an adjunct in the management of myocardial shock. For this purpose an initial intramuscular injection of 15 mg. of methoxamine hydrochloride may be given, followed by slow intravenous infusion of a solution containing 35 mg. per 250 cc. of 5% dextrose in water for injection; the rate of flow must be adjusted to provide the desired response. Administration should be closely supervised so that the drug is gradually slowed and discontinued as soon as the patient no longer shows clinical evidence of shock.

Burroughs Wellcome & Company, Inc., cooperated by furnishing scientific data to aid in the evaluation of methoxamine hydrochloride.

Hexachlorophene Limited to Preoperative Use on the Skin

In addition to the use of hexachlorophene in soaps and detergents for preoperative disinfection of the normal skin, the Council previously recognized its use for decreasing the incidence and severity of miliaria, ammoniacal dermatitis, seborrheic dermatitis ("cradle cap"), and pyogenic skin infections including carbuncles, furuncles, and impetigo. A review of the evidence for either the prevention or treatment of these infections has revealed that the available data are based on poorly controlled experiments and are too meager to warrant continued recognition of such claims. Consultant experts in this field, who concurred with this view, agreed that the use of hexachlorophene had been conclusively established only for preoperative disinfection of the normal skin.

The Council voted to revise the monograph on hexachlorophene for New and Nonofficial Remedies accordingly.

Additional Uses for Lidocaine Hydrochloride

Several years ago the Council recognized the use of appropriate concentrations of lidocaine hydrochloride for infiltration, block, low caudal, and topical anesthesia; the Council believed that, until its toxic potentialities had been compared with longer-established agents, it should not be used for the more hazardous procedures, continuous caudal, peridural, or spinal anesthesia (New and Nonofficial Remedies 1955, pp. 49-51). The manufacturer subsequently made available further evidence, which has accumulated since the agent was initially evaluated, concerning experience with the latter uses. It indicates that the agent can be employed with reasonable safety for these additional forms of anesthesia when proper precautions are exercised to observe established techniques and to avoid overdosage. The Council agreed with the opinions of consultant anesthesiologists that drowsiness frequently observed after the use of the agent without epinephrine in block or regional anesthesia is indicative of a central depressant action and that undesirable symptoms and warning of overdosage to be avoided include hypotension, pallor, sweating, nausea, vomiting, and muscular twitching.

The Council voted to recognize the additional uses of lidocaine hydrochloride for continuous caudal, peridural, and spinal anesthesia and to revise the monograph for New and Nonofficial Remedies accordingly.

Astra Pharmaceutical Products, Inc., cooperated by furnishing scientific data to aid in the evaluation of lidocaine hydrochloride.

Ophthalmic Use of Erythromycin

The Council has been requested to evaluate the use of erythromycin in the form of an ophthalmic ointment containing 5 mg. per gram. On the basis of currently available evidence, the Council concluded that the topical use of this antibiotic is justified in the treatment of ocular infections that are caused by organisms susceptible to its action. Mild, transient reactions to ophthalmic application have occurred occasionally. The ophthalmic ointment may be applied directly to the infected eye one or more times daily, depending on the severity of the infection.

The Council voted to amend New and Nonofficial Remedies accordingly to recognize this additional use of erythromycin.

Eli Lilly & Company cooperated by furnishing scientific data to aid in the evaluation of erythromycin.

Parenteral Use of Methscopolamine Bromide

The manufacturer of methscopolamine bromide, an anticholinergic drug, has proposed evaluation of its use by subcutaneous or intramuscular injection in acute exacerbations of peptic ulcer when a rapid reduction of gastric acidity and motility is desired or when the patient cannot take the drug by the usual oral route. Clinical observations on the parenteral injection of the drug that were furnished by the manufacturers were found adequate to indicate the feasibility of this route of administration for such patients. The usually effective dosage was found to range from 0.25 to 1 mg. (0.25 to 1 cc. of a solution containing 1 mg. per cubic centimeter) injected subcutaneously or intramuscularly every 6 to 8 hours until acute symptoms are brought under control or oral medication becomes feasible.

The Council voted to expand the New and Nonofficial Remedies monograph on the drug accordingly to recognize its parenteral use.

The Upjohn Company cooperated by furnishing scientific data to aid in the evaluation of methscopolamine bromide.

ROLE OF THE EPIDEMIOLOGIST

Since the epidemiologist is concerned with disease as it affects the whole population or some special segment of it rather than as it affects the individual, his role is often not appreciated by the practitioner, whose chief but not sole concern is the individual patient. In the past epidemiologists have used their talents primarily to trace the sources of infectious diseases, but, as the relative importance of this group of diseases has decreased, the epidemiologist has found that the methods of study he has developed over the years can be applied to various kinds of accidental injury and the chronic degenerative diseases.

Morris [1] has described seven distinct uses to which epidemiology can be put. Historical studies may bring to light a trend indicating either an increase or a decrease in the incidence of a disease. Such studies give important intimations of the future behavior of the disease in a population. Concurrent studies describe the nature and relative size of disease problems in various regions and the distribution of a disease by age, sex, race, occupation, economic status, or any other factor in which the investigator is interested. Through the use of life tables a person's life expectancy can be computed for any age. Through operational research it can be determined how well certain community health measures or programs are working.

Another use of epidemiology is the completion of the clinical picture by determining what segment of the population is most susceptible to a disease. The accuracy of such observations depends on the discovery of all the cases in a community or on a screening survey of a truly representative portion of the population. The results of such surveys indicate what groups should receive the major effort in a control program. The epidemiological method has been useful in separating entities that were once grouped together. From the peptic ulcers of the early 1920's gastric ulcer and duodenal ulcer emerged as different diseases. Efforts are now being made to separate coronary arteriosclerosis from other forms of coronary heart disease. The reverse process led to the discovery that congenital malformations resulted from maternal rubella occurring during gestation, that rheumatic fever was a streptococcic infection, and that herpes zoster was a manifestation of the chickenpox virus.

Perhaps the most important function of the epidemiologist is the identification of harmful ways of living. Faulty dietary habits were thus shown to cause the avitaminoses; the drinking of polluted water was shown to cause intestinal disease; crowded living space was shown to predispose to respiratory disease; overeating of various foods was shown to be related to the development of such conditions as arteriosclerosis, diabetes, dental caries, and the toxemias of pregnancy; physical inactivity was shown to predispose to coronary thrombosis; and social isolation was shown to lead in some patients to schizophrenia, suicide, or senile dementia. The relation between tobacco smoke and cancer of the lungs and coronary thrombosis is still being investigated. Many other examples could be cited. The results when proved set the direction environmental or personal control measures should take.

In view of these facts, it can be seen that more epidemiology is needed from the standpoint of public health and medicine as a whole. The epidemiological method offers the possibility of testing hypotheses regarding the cause and control of disease. In fighting disease the best results will be obtained if the practicing physician, the laboratory scientist, and the epidemiologist collaborate. No one of these can do the job alone.

SURVIVORSHIP BENEFITS FOR PHYSICIANS' WIDOWS AND MINOR CHILDREN

Advocates of compulsory coverage of physicians under the Old-Age and Survivors Insurance section of the Social Security Act contend that self-employed physicians with young children could well afford to pay the entire Social Security tax for the sole purpose of obtaining survivorship benefits under OASI for the widow whose children are under 18 years of age. The maximum amount of these benefits is now $200 a month. A widow under 65 years of age can receive survivorship (mother's) benefits only if she has in her care a minor child entitled to a child's benefit. It is also claimed that all other benefits promised under OASI are very desirable; for example, benefits for widows and wives aged 65 and over. The facts do not support this contention, however, as equal or greater benefits for the widow while the children are under age 18 can be purchased from life insurance companies at a lower cost.

---

[1] Morris, J. N.: Uses of Epidemiology, Brit. M. J. 2:395-401 (Aug. 13) 1955.

Under the 1954 amendments to the Social Security Act, the present tax on self-employed persons is 3% of their annual earnings up to $4,200 a year. Provision is made for an increase to 3.75% during the period 1960-1964, to 4.5% in 1965-1969, to 5.25% in 1970-1974, and to 6% starting in 1975. On earnings of $4,200 a year, the tax is now scheduled to rise from $126 to $252. This schedule can be altered, of course, at any future session of Congress. For example, these percentages would be raised by 0.75% under the provisions of H. R. 7225, which passed the House of Representatives last summer by a large majority. It is, therefore, unrealistic to examine this claim about the value of survivorship benefits for the widow with minor children without recognizing that an increase in the tax rate is already scheduled. Furthermore, the tax base has risen to $4,200, and there is a reasonable prospect that a tax base of $4,800 or possibly $6,000 may be established in the foreseeable future. For the purpose of examining this problem, nevertheless, it will be more conclusive to consider $126 a year as the basis for comparison with life insurance premiums.

Few, if any, life insurance companies offer policies that precisely match the survivorship benefits under OASI for a widow with minor children. Comparable insurance policies specify a term of years—10, 15, or 20—rather than protection until the youngest child attains 18 years of age. The "family income" feature comes close to matching these particular OASI benefits, but the premium paying period, unlike the OASI bite, ends with the term of protection. For example, a young physician aged 25, by paying an extra annual premium of approximately $65, can obtain a "family income" clause—at the time of purchase or later on if he is still insurable—in his $20,000 ordinary life insurance policy that would pay his family $200 a month during the interval between his death and the 20th anniversary of the issue of the policy, at which time the children would be 20 years older and the extra premium would cease. If the father died seven years after the issuance of the policy, the family would receive $200 a month under the "family income" clause for the next 13 years, when the $20,000 basic life insurance policy would be payable. Thus the face amount of the ordinary life insurance policy is not diminished by the payment of monthly benefits of $200 a month. If the father survived the 20 year period, the "family income" clause and its extra premium would terminate.

For a physician 30 years of age, the premium for a "family income" clause for $200 a month would be about $85 a year; for a physician 35, about $115 a year; and for a physician 40, about $166 a year. For this latter comparison, protection for 20 years after the issue of the policy is offered over too long a period for most physicians 40 years of age, because few fathers are over 40 when the last child is born. A more realistic counterpart to the survivorship benefits for a widow with minor children under OASI until the youngest child attains age 18 might be a 10 year "family income" clause for a physician 40 years of age, which would require an annual premium of approximately $60; the extra annual premium for a 10 year "family income" clause at age 45 would be only $83. Almost all self-employed physicians with young children—many employed physicians are now paying OASI taxes—can purchase the counterpart to OASI survivorship benefits to cover their wives in the event they should become widows and until the youngest child would attain 18 years of age for less than $126 a year.

The contention that $126 is a bargain price for the claimed OASI benefits is further weakened by the fact that less than $200 a month would be payable under the 1954 amendments to the Social Security Act if and when the widow had only one child under 18. The primary insurance benefit for the husband, which is the basis for computing the survivorship benefit for the widow and minor children, would be $108.50 a month; the survivorship benefit for one minor child would be three-fourths of this amount, $81.40 a month, and a similar amount for the widow totals $162.80 a month. The fact that many physicians do not leave a widow with minor children is worth noting, although it has no bearing on the argument of young physicians with minor children that this one feature would make OASI a bargain for them. Only by including in the comparison both the widow's benefit, which would stop should she remarry or return to substantial gainful employment, and the benefits for at least two minor children could a standard of $200 a month be established for comparing the tax of $126 a year with the annual premium on a "family income" clause for $200 a month added to a $20,000 ordinary life insurance policy. Incidentally, some insurance companies will add a $200 a month "family income" clause to a $10,000 life insurance policy. Our concern here is with the extra premium charged for the "family income" clause.

Over and above these points of superiority in the provision for survivorship benefits for the widow and minor children by the purchase of insurance is the fact that the insurance policy is a contract providing for definite extra premiums for only 10, 15, or 20 years, has a definite scale of benefits, and is enforceable in the courts.

It is obvious that the original contention about bargain prices under OASI is false even under the assumption that only interested physicians with young children would be covered and taxed; it is not valid for voluntary coverage, to say nothing of compulsory coverage, of physicians under OASI. Considering the present provisions of the Social Security law, the young physician would fare best by purchasing survivorship benefits for his widow and minor children from a reputable life insurance company under a "family income" clause. Admittedly, survivorship benefits for a widow with minor children are not the only claimed benefits under OASI, but $126 a year—the initial cost—is an exhorbitant price to pay for them alone. Furthermore, a rise to $252 in the annual tax by 1975 is already scheduled.

ORGANIZATION SECTION

MEDICOLEGAL SYMPOSIUMS

Over a thousand doctors and lawyers from 20 states attended three regional medicolegal conferences sponsored by the Committee on Medicolegal Problems and the Law Department of the American Medical Association. These meetings, held in Chicago on Oct. 9, Omaha on Oct. 16, and New York on Oct. 30, were the first joint meetings of members of both the legal and the medical professions organized and sponsored by a national organization.

Dr. Elmer Hess, President, Dr. George F. Lull, Secretary and General Manager, and Dr. James Reuling, a Trustee of the Association, welcomed guests at the respective conferences and officially pledged the Association's full support to programs designed to better rapport between law and medicine. They established the theme of the meetings by pointing out that, while no conflict should exist between the two professions, it does—because time, knowledge, and opportunity to eliminate misunderstandings are lacking. In Dr. Hess' words, the meetings were planned and conducted on the conviction that "the ripple of understanding they create will spread through the professions, eventually clearing up the sometimes muddy medicolegal waters." The welcoming speakers all emphasized that the issue is not whether lawyers and doctors can work together but rather how they can work together most effectively for the benefit of those people who must depend on their mutual cooperation.

Three broad areas of medicolegal relations were considered: medicine's contributions to the administration of justice; mutual medicolegal problems as viewed by each profession; and a demonstration showing a medical expert witness under proper and improper courtroom conditions. In the area of the administration of justice, there were provocative discussions on traumatic neurosis, trauma and disease, medical expert testimony, and medical science in the administration of criminal justice. In the area of medicolegal problems, there were discussions of the several aspects of professional liability; a consideration of the professional man as a taxpayer; and an exploration of the best methods to insure unbiased medical expert testimony.

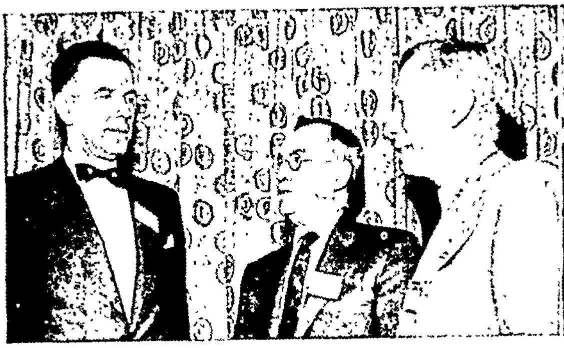
In developing the theme of the conferences, it was admitted that lawsuits are adversary proceedings and conflict is a major element in the medicolegal field. Discussions and papers presented from the viewpoint of each profession proved that doctors and lawyers are both attempting to obtain the best results from individual and professional efforts. In presenting the view of medicine or law, every effort was made to clarify misunderstandings, not for the sake of understanding alone but as a means to an end—the welfare of the individuals served, whether identified as patients, clients, or the public.

The late Dr. Louis Regan, a member of the A. M. A. Committee on Medicolegal Problems, pointed out that medicine participates less effectively in the administration of justice in the U. S. than in any comparable civilized country in the world. Another speaker urged pretrial conferences between doctors and lawyers and advanced the theory that, if doctors would prepare complete reports concerning an individual's medical disability and make the reports available to attorneys properly associated with a case, the doctor would in all probability spend less time in court. In this way, adequate records would often permit a claim to be settled equitably without submission to a jury. The doctor's reluctance to go to court and ways to overcome that reluctance were mentioned in several of the presentations. Physicians also came in for their share of criticism on the ground that, although they insist strongly on scientific objectivity in their daily practices and research, they become less objective as witnesses.

It was pointed out that, because of the trend of some court decisions, the physician is often compelled to give thought to protecting himself against the patient even as he cares for that patient. The urgency for the adoption of the medical examiner system for the protection of the innocent as well as detection of the guilty was stated emphatically. It was stressed that no community can afford to let an innocent man go to prison or a murderer go unpunished today when medical science is available to prevent such miscarriages of justice.

The matter of taxation did not escape notice. It was said by one of the speakers that the "political, legislative and administrative atmosphere in which income tax has mushroomed, especially since 1930, stems from indifference and hostility to the professional man, especially where he is self-employed." Physicians and other professional men have tax disabilities not suffered by the self-employed businessman, including limitations on division of fees, advertising restrictions, entertainment expenses, and the use of partnership or corporate form of practice with possible tax advantages.

The balance of the meeting was devoted to the questioning of a medical expert witness in a two-part mock trial demonstration. In the first part of the demonstration, the medical witness had not been prepared in any way for the role he was to play in the administration of justice. He had poorly prepared himself and had not been adequately advised by the attorney who employed him. As a result he was laid open to a cross-examination that destroyed the credibility of his testimony and made him appear something less than an expert in his specialty. Then the same witness, under the same factual situation, was characterized as a thorough and capable physician. He had conducted a complete examination of the individual and his testimony was objective and factual. Because of preparation he was not, as a witness, subject to a successful attack on cross-examination. The witness was Dr. Ralph E. DeForest, Secretary of the A. M. A. Council on Physical Medicine. He underwent direct



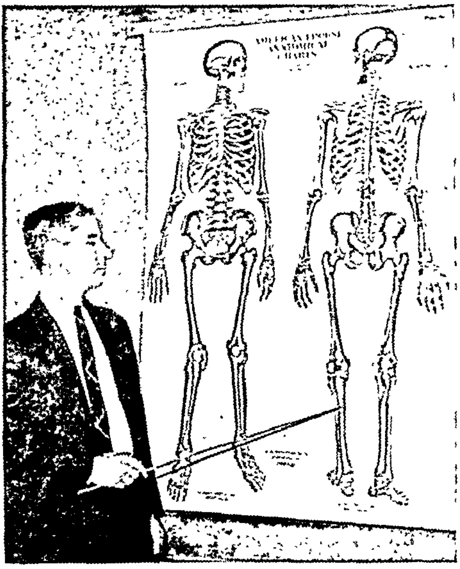
Henry J. TePaske, Iowa City, president of the Iowa Bar Association, discussed the Omaha program with Dr. Joseph McCarthy and Wilbur S. Aten, president of the Nebraska Bar.

At the Omaha meeting were Dr. Alan R. Moritz, Cleveland, Chairman, A. M. A. Committee on Medicolegal Problems; C. Joseph Stetler and Dr. George F. Lull, Chicago; and Dr. Joseph McCarthy, Omaha-Douglas County Medical Society, who was chairman of the meeting.

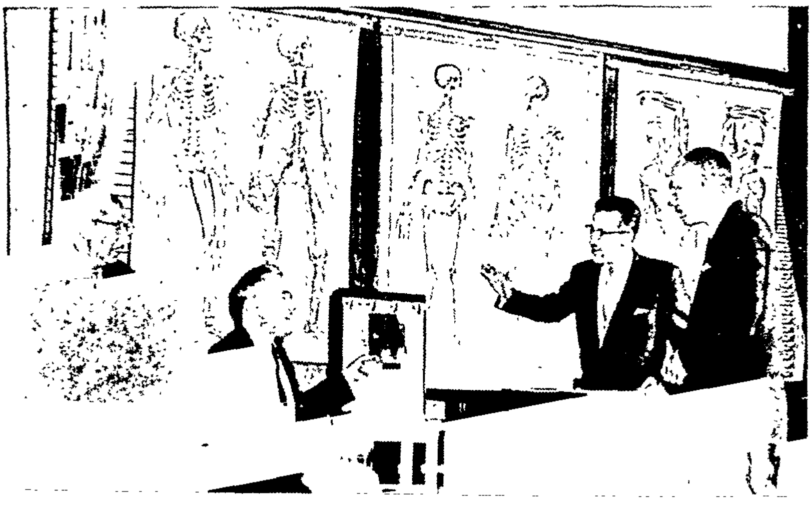
R. B. Murphy, Madison, Wis., attorney, discussed professional men's tax problems.

The late Dr. Louis Regan, Los Angeles, physician and attorney, gave some pointers on medicolegal problems from the *standpoint of both professions.*

Dr. Harlan English, Danville, Ill., presided over the opening meeting in Chicago.

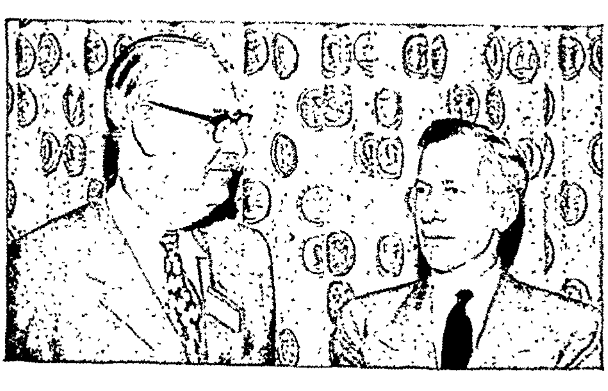


Above—Dr. Richard Ford, acting head, department of legal medicine, Harvard University School of Medicine, gave an illustrated talk showing how easy it is to make a mistake in attributing death to accident, murder, or suicide and pointing out the need for qualified medicolegal examiners.



Left—A highlight of all three symposiums was the "mock trial" of an actual Illinois personal injury case *involving expert testimony concerning a slipped intervertebral disk.* Performers were Irving Golstein, Chicago, as judge; Dr. Ralph E. DeForest, Secretary, Council on Physical Medicine and Rehabilitation, as witness; and R. G. Van Buskirk and Edwin Holman, of the A. M. A. Law Department, as attorneys for the plaintiff and the defense.

Welcoming speakers for the Omaha meeting were Dr. William E. Wright, Creighton, Neb., president, Nebraska State Medical Association, and Wilbur S. Aten, Holdredge, Neb., president, Nebraska Bar Association.



G. C. A. Anderson, Baltimore attorney, who discussed unbiased medical expert testimony, talks with the late Dr. Shabat and Dr. Moritz at Omaha.

examination by R. G. Van Buskirk and cross-examination by E. J. Holman, both members of the A. M. A.'s Law Department.

The script for the demonstration was prepared by Mr. C. Joseph Stetler, Director of A. M. A.'s Law Department, and was designed to stress the importance of cooperation between attorney and physician, adequate pretrial conferences, and understanding of the issues to be presented to and decided by judge and jury. After the formal presentation of papers and the demonstration, the meetings were opened to discussion from the floor. So popular was the discussion period that it was necessary for the chairman at each meeting to use his gavel to terminate the discussion.

The speakers and the titles of their papers included:

LOUIS J. REGAN,* M.D., LL.B., Los Angeles, "Medical Legal Problems—The Physician's and Lawyer's Viewpoint"

JOHN P. GILLIGAN, M.D., Nebraska City, Neb., "Medical Legal Problems—The Physician's and Lawyer's Viewpoint"

ROBERT B. MURPHY, LL.B., Madison, Wis., "The Professional Man as a Taxpayer"

EARL CLINE, Lincoln, Neb., "Professional Liability"

WILLIAM F. MARTIN, New York City, "Professional Liability"

G. C. A. ANDERSON, Baltimore, "Unbiased Medical Expert Testimony—An Actuality"

ALAN R. MORITZ, M.D., Cleveland, "Medical Science in the Administration of Criminal Justice"

RICHARD FORD, M.D., Boston, "Medical Science and the Courts"

ERIC OLDBERG, M.D., Chicago, "Traumatic Neurosis"

ROLAND P. MACKAY, M.D., Chicago, "Traumatic Neurosis"

SAMUEL BROCK, M.D., New York City, "Traumatic Neurosis"

HARRY GAIR, New York City, "Traumatic Neurosis"

IRVING GOLDSTEIN, LL.B., Chicago, "Medical Expert Testimony"

L. WILLARD SHABAT,† M.D., Chicago, "Medical Expert Testimony"

WILLIAM J. HOTZ JR., Omaha, moderator of expert panel

* Dr. Regan died on Dec. 3.

† Dr. Shabat died on Oct. 21.

SCIENTIFIC PROGRAM, CHICAGO MEETING JUNE 11-15, 1956

Preparations for the Annual Meeting in Chicago are rapidly taking shape. The sections of the Scientific Assembly will hold meetings Tuesday, Wednesday, and Thursday, some in the mornings and some in the afternoons. In the Section on Miscellaneous Topics, a Session on Allergy will be presented on Wednesday morning. The General Scientific Meetings will be held all day Monday and Friday morning. On Monday, the meeting will be held in the Gymnasium of the University of Illinois, adjacent to Navy Pier. The Friday morning meeting will be devoted to traffic accidents and will undoubtedly be held at Navy Pier.

The Section meetings will be held in the places listed below:

Anesthesiology	Sheraton Hotel
Dermatology	Knickerbocker Hotel
Diseases of the Chest	Knickerbocker Hotel
Experimental Medicine and Therapeutics	Sheraton Hotel
Gastroenterology and Proctology	Gymnasium, University of Illinois, adjacent to Navy Pier
General Practice	Drake Hotel
Internal Medicine	Sheraton Hotel
Laryngology, Otology and Rhinology	Northwestern University, Thorne Hall
Military Medicine	Cinema Theater
Nervous and Mental Diseases	Drake Hotel
Obstetrics and Gynecology	Drake Hotel
Ophthalmology	Northwestern University, Thorne Hall
Orthopedic Surgery	Lake Shore Club
Pathology and Physiology	Drake Hotel
Pediatrics	Sheraton Hotel
Physical Medicine	Knickerbocker Hotel
Preventive Medicine	Cinema Theater
Radiology	Lake Shore Club
Surgery, General and Abdominal	Gymnasium, University of Illinois, adjacent to Navy Pier
Urology	Drake Hotel

The Color Television and Motion Picture programs will be presented in rooms at Navy Pier.

The Scientific Exhibit will be presented at Navy Pier in cooperation with the various Sections of the Scientific Assembly. Applications for space close on Jan. 9; application blanks may be obtained from the section representatives or from the Secretary, Council on Scientific Assembly, American Medical Association, 535 N. Dearborn St., Chicago 10.

Christmas At The A.M.A.

'Twas several nights before Christmas but all through the place everyone was stirring . . . at the A. M. A.'s annual Christmas party of the Employees' Recreation Association. Several hundred of the headquarters staff lined up at 5 p. m. on Dec. 13 to await their serving of a traditional turkey dinner in the A. M. A. cafeteria, festively decorated for the holiday season. After the dinner, the 25-member "SingerAMA" presented a concert of Christmas carols and a recital of organ selections. The gala evening was climaxed by a tableau of the nativity scene.

Guests were admitted on presentation of gifts for distribution this week to needy patients in children's hospitals and welfare convalescent homes and to elderly pensioners throughout the Chicago area. More than 600 gifts were donated by the employees.

The E. R. A. was organized four years ago to develop good fellowship among the Association's 900 employees in its numerous departments and to promote a spirit of cooperation within the headquarters building. These photographs speak for its success.

PROCEEDINGS OF THE BOSTON CLINICAL MEETING

ABSTRACT OF PROCEEDINGS OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION AT THE CLINICAL MEETING IN BOSTON, NOV. 29-DEC. 2, 1955

The actions of the House of Delegates at the Boston Meeting are herewith abstracted so that the readers may have this information in digest form. The official proceedings will be made available, as in the past, in a booklet, which will be sent to all members of the House of Delegates and officers of the American Medical Association by the Secretary. This booklet will not be available for several weeks.—Ed.

Invocation

Dr. Edwin P. Booth, professor of historical theology at Boston University School of Theology, pronounced the following invocation:

Accept, O Lord, the praise and thanksgiving of a grateful people for the benefits of medicine. We accept, O Lord, Thy commands to study, to investigate, to experiment, and to sympathize. We are grateful for the light Thou hast given our fathers in medicine in their time, and we pray for Thy blessing upon our efforts in our time, working with Thee to sustain life, to relieve suffering, to restore health. Especially do we pray that we may fulfill that portion of this great task which falls upon this assembly. Give light to our minds, firmness to our judgments, and skill to our persuasion, that, understanding the tasks that lie before us, we may find the right procedures and the right answers to carry forth this mighty work. We lift before Thee in gratitude all the forces that cooperate with medicine, all the technicians, and every other aspect of this great work, and upon the assembly here gathered in Boston representing the American aspect of Thy world-wide medicine; our own tasks and all these other tasks we lay before Thee for Thy guidance, and unto Thy gracious care and protection we commit ourselves and all we do. Grant us, O Lord, Thy guidance and Thy blessing. Amen.

Preliminary Report of Reference Committee on Credentials

Dr. Raymond F. Peterson, Chairman, Montana, reported that 184 delegates had been seated, and informed the Speaker that a quorum was present.

General Practitioner of the Year

Dr. Gunnar Gundersen, Chairman, Board of Trustees, made the following announcement:

The Board of Trustees is pleased to announce the selection of Dr. E. Roger Samuel of Mount Carmel, Pa., as the recipient of the General Practitioner of the Year award.

Dr. Samuel has been a general practitioner for 35 years and practices in the town where he was born. He is active in charitable, civic, and medical organization work and was nominated by the Medical Society of the State of Pennsylvania after original sponsorship by the Mount Carmel Rotary Club and the Northumberland County Medical Society. Dr. Samuel was born Sept. 25, 1889, attended Dickinson College, and was graduated from the University of Pennsylvania School of Medicine in 1913. After spending a year as resident pathologist at the Pennsylvania Hospital in Philadelphia, he entered general practice in Mount Carmel. He married Emily G. Snyder in 1917 and has three daughters. During World War I he served as captain in the Army Medical Corps assigned to the British Expeditionary Forces and was awarded the Purple Heart. He is a charter member and past commander of the Mount Carmel American Legion post. Dr. Samuel, a 33rd degree Mason, Past Master, and present trustee of his local lodge, has been trustee, treasurer, and Sunday school teacher of the First Methodist Church, president of the Community Concert Association, president of the Northumberland County unit of the American Cancer Society, medical advisor of the tuberculosis and health committee, and member of the board of the Mount Carmel Red Cross chapter and the Mount Carmel Rotary Club.

He has been active in civil defense, establishing first-aid stations throughout the area, and was a member of the Selective Service Board during World War II. He has been president of the Board of Health, Fraternity Club, Kiwanis Club, and president and founder of the Mount Carmel Chamber of Commerce. Dr. Samuel has been president of the county and state medical societies and has held other offices in both groups. He also has been president of the staff at the Shamokin State Hospital, compensation doctor for the Jeddo-Highland Coal Company, surgeon for the Lehigh Valley Railroad Company, member of the board of the Medical Service Association of Pennsylvania (Blue Shield), and a member of the American Academy of General Practice, the World Medical Association, and the Association of Railway Surgeons.

Adoption of Minutes of Atlantic City Annual Meeting

The minutes of the Annual Meeting held in Atlantic City, N. J., June 6-10, 1955, were adopted as printed and distributed to the members of the House of Delegates.

Remarks of the Speaker, Dr. E. Vincent Askey

The Speaker presented the following remarks, which were referred to the Reference Committee on Reports of Officers:

Members of the House of Delegates of the American Medical Association: The address of the Speaker is limited to matters of conduct and procedure in the House. Every organization has a few procedures peculiar to itself either by tradition or prescribed by its constitution and bylaws. It happens that at every session of our House of Delegates there are a few members who have not been seated before. It is not amiss therefore, for their benefit, to call attention to some parts of the *modus operandi* of our House. First, I would urge you all most carefully to read and become familiar with the little booklet you have received, "Your Role as a Delegate to the American Medical Association." This has been prepared very carefully, and compliance with its requests will aid the conduct of the business of the House immeasurably. In addition, every delegate should be familiar with the current Constitution and Bylaws and the Principles of Medical Ethics. Changes are made from time to time, and you should be up to date in your knowledge of them. Robert's Rules of Order are the rules of the House except where the Constitution and Bylaws specifically direct otherwise. The ordinary rules of order may be suspended by a two-thirds vote of the House, but any rule specified by the Constitution or Bylaws cannot be changed except in the prescribed manner even by a unanimous vote of the House. The order of business may be changed by majority vote.

The Chair would refresh your memory to the fact that the House is made up of voting and nonvoting members. All regularly elected or designated delegates who are seated are entitled to the floor and also to vote. Since the Speaker and Vice Speaker are regular delegates they are entitled to all the privileges of regular delegates except that the Constitution and Bylaws specifically state that the Speaker, the one in the Chair, votes only in case of tie. The general officers of the Association, the past-presidents and past-trustees, and some other specified persons such as the Editor, the Assistant Secretary, the chairmen of councils and the delegates from the Student American Medical Association are nonvoting members of the House and as such are entitled to all the privileges of the floor but are not entitled to vote. It has been asked how the Speaker and Vice Speaker can vote when they are general officers and do not have a vote. When the Speaker and Vice Speaker vote, they do so as regularly elected delegates. This brings to attention a minor detail of procedure. The Secretary is a nonvoting member of the House. The Bylaws require all elections to be by ballot, except where there is only one nominee for an office. In that case a majority vote without ballot elects. Therefore the Secretary cannot legally cast the ballot. Should you wish to move that a ballot be cast the Chairman of Tellers should be so delegated.

Each member of the House of Delegates is entitled to speak once, on recognition—twice if no other member wishes the floor—for 10 minutes each time. He may speak more times if no objection is made or if motion to extend debate is ordered by a two-thirds vote. No attempt will be made by the Chair to curtail free and adequate discussion. In case of heated controversy, however, the rules will be strictly enforced, and they should be understood thoroughly.

REFERENCE COMMITTEES

The reference committees are a most important part of the House procedure. The members of each committee are chosen by the Speaker with great care. Experience, ability, geographic location, division of practice, seniority, and integrity are all factors entering into appointments. For that reason no member of a committee should disqualify himself from acting on any matter referred to his committee merely because he has an opinion on it or because it comes from his state or for similar other reason. The committee merely makes a report to the House, and the House may adopt or reject the report as it sees fit. Each committee member is expected to give his best efforts to seek the best answer to each problem and to stand by his honest convictions.

A short discussion of the procedure of receiving the committee reports may be of value at this time. The majority report is the report of the committee. A minority report is one which does not agree with the majority and, if adopted, has the effect of nullifying the majority. A substitute motion is an amendment with certain peculiar variations. A minority report is actually an argument against the majority report and is germane to debate for or against adoption of the majority report. There are many good opinions that vary as to how a substitute motion should be handled. However, our Bylaws follow Robert's Rules of Order. Our interpretation of these rules follows very closely what we have used in the past. A committee report, majority, is presented and is open for discussion. A minority report is made and constitutes an argument against the committee, majority, report. It is moved that this minority report be substituted for the committee report. Then the original motion is again open to discussion and since the minority report is an argument against the motion it may be discussed also. When all discussion is ended, the motion to substitute the minority report for the majority is voted. If this motion carries, then the majority report is lost and the minority report is before the House and open to more discussion. It is then voted. If the motion to substitute be lost, the original majority report is before the House and open to discussion and vote. If neither the report of the committee nor the minority report be adopted then the original resolutions given to the reference committee may be called up on the floor for direct action unless they have been disposed of. By that I mean that sometimes the committee report, if it is turned down, disposes of the original motion.

Special committees ordered by the House of Delegates report directly to the House, and then their reports are referred to the appropriate reference committees. The Chair would again call attention to the fact that all business of this House must be referred to a committee except by specific action of the House. Committees of the Board of Trustees report to the Board, and their reports are assigned, on presentation to the House of Delegates, to one of the regular reference committees for consideration. Standing committees, the councils, of the House of Delegates present their reports to the House at the interim meeting and these are referred to appropriate reference committees. All special committees and reference committees of the House die with the end of the meeting at which they report unless extended by definite action. Therefore, a motion to discharge such a committee is superfluous.

The Chair would again urge you to expedite consideration of the business of the House by getting all reports and resolutions in early. Also, it is important that you edit your resolutions so that the action refers to the American Medical Association rather than merely presenting a facsimile of a resolution that was passed by your state association or other body.

Your Speaker has continued the innovations which his esteemed predecessor instituted. Changes will be made if need arises. However, the maxim of St. Paul still is one good to follow—"Prove all things, hold fast to that which is good."

REPORT OF REFERENCE COMMITTEE ON REPORTS OF OFFICERS

Dr. Wesley W. Hall, Chairman, Nevada, submitted the following report, which was adopted:

Address of the Speaker: This was a brief but very thorough lesson in parliamentary law, so necessary for efficient handling of the House of Delegates. Your committee feels that the subject matter of this address should be incorporated in the booklet "Your Role as a Delegate to the American Medical Association." In addition, your committee feels that a copy of this address should be forwarded to the speaker of the house of delegates of each state society to be used as an additional guide in his conduct of state assemblies. Furthermore, your committee reemphasizes the Speaker's request that all resolutions and reports be submitted as early as possible, thereby preventing a last minute rush. It is noted that far more time is required by the office staff in assembling and filing paper work than in actual mimeographing.

Your reference committee wishes to compliment both the Speaker and Vice Speaker for the excellent manner in which they are conducting the affairs of the House.

Reference Committees of the House of Delegates

The Speaker announced the appointment of reference committees as follows:

AMENDMENTS TO THE CONSTITUTION AND BYLAWS

J. J. Crane, *Chairman*, Section on Urology
Maurice J. Dattelbaum, New York
Karl S. J. Hohlen, Nebraska
Francis T. Holland, Florida
Stanley B. Weld, Connecticut

BOARD OF TRUSTEES AND SECRETARY, REPORTS OF

Homer M. Izumi, *Chairman*, Hawaii
Woodruff L. Crawford, Section on Pediatrics
Frank A. MacDonald, California
George A. Unfug, Colorado
Dexter H. Witte, Wisconsin

CREDENTIALS

Raymond F. Peterson, *Chairman*, Montana
Thomas M. d'Angelo, New York
John N. Gallivan, Connecticut
R. T. Johnstone, Section on Preventive and Industrial Medicine and Public Health
Spencer A. Kirkland, Georgia

EXECUTIVE SESSION

William F. Costello, *Chairman*, New Jersey
Frank J. Elias, Minnesota
Leopold H. Fraser, California
Howard K. Petry, Pennsylvania

Presentation of Medal to General Practitioner of the Year, Dr. E. Roger Samuel

Dr. James Z. Appel, Pennsylvania, escorted to the rostrum Dr. E. Roger Samuel, Mount Carmel, Pa., and Dr. Gunnar Gundersen, Chairman, Board of Trustees, presented him with the General Practitioner of the Year Gold Medal award.

Dr. Samuel accepted the medal with the following remarks:

I accept this great honor in behalf of the general practitioners of America. We have finally, after a great many years, attained the privileges and right to practice medicine amongst you fellows.

When I was a member of the House many years ago, there were very few general practitioners who could find the time and the energy and the money to come to all these meetings, but since then, they tell me, there has been a new crop that has grown up and there are a few of us poor, debilitated fellows scattered amongst you to help in these deliberations. I think the thing that impresses me most about this whole business is the fact that it comes from the grass roots. Your county society suggests one of your members for this important honor and the rest of you concur. I accept this honor very humbly, but I do believe it is something that is going to give heart and energy to the general practitioners throughout the nation. I remember the time when a delegation came to me and asked me to be president of the Medical Society of the State of Pennsylvania. I said, "I can't do that. I haven't got the time. I haven't got the energy to do that kind of a job." They said, "Our general practitioners are feeling that this thing has been handed down from one group to another, and we feel that the general practitioner should be represented." As a result, I accepted that job, and every place I went men said to me, "You have encouraged and enheartened the general practitioners in your state."

I think I am correct in believing that you are my friends, and I know that I am your friend. I work with you and you work with me. You have given me this great honor and I accept it with due humility in the name of all the general practitioners of the United States. Thank you!

Report of Reference Committee on Rules and Order of Business

Dr. B. O. Edwards, Chairman, North Carolina, presented the following report, which was adopted:

Your Reference Committee on Rules and Order of Business recommends (1) that the Order of Business be as it is printed and has been distributed to the delegates; (2) that the Speaker be authorized to vary this order if necessary adjustments become evident, unless objected to and ordered by the House; (3) that the Speaker recess the House at times to be determined by him and best suited for the comfort of the members; and (4) that the Speaker be allowed to grant the privilege of the floor to such persons as may be presented by the President or Chairman of the Board of Trustees and to others who will aid in the deliberations of the House, unless countermanded by vote of the House.

Contribution to American Medical Education Foundation

At the request of the Speaker, Dr. Donald Cass, California, and Dr. Louis H. Bauer, President of the American Medical Education Foundation, came to the rostrum, and Dr. Cass presented a check to Dr. Bauer, with the following remarks:

It gives me a great deal of pleasure to present to the American Medical Education Foundation a check for $25,000 from the California Medical Association. I want to add another word. The Audio Digest has an exhibit in Mechanics Hall, and it is now making money, but unfortunately we have not made enough yet to make a contribution; the money that has accrued in our treasury has had to be used in the business. However, I believe that from now on each year you can expect a substantial contribution from The Audio Digest.

Remarks of Dr. Louis H. Bauer, President, American Medical Education Foundation

Dr. Bauer accepted the check tendered by Dr. Cass with the following remarks:

On behalf of the American Medical Education Foundation and the American medical colleges, I want to thank the California Medical Association for this generous gift. We also want to thank the other state associations that have made contributions to the Foundation, as well as the individuals who have made contributions.

The Foundation is not in as healthy a shape as I wish it were. The amount which we shall be able to turn over to the medical schools the first of January is slightly more than we were able to turn over last year, but that is due to one thing and one thing only, namely, that we had six months more to accumulate funds. Had we made the contribution last July, as we had been making it in previous years, we would have fallen quite a bit short of the funds necessary. We are aiming at 2 million dollars from the doctors and the medical associations of America. We have never approached that. We contributed a little over a million dollars last year, and it will be approximately $1,100,000 this year, provided the contributions during the month of December keep up as they have been coming in in the last couple of weeks.

In talking to representatives of the National Fund for Medical Education, which, as you know, is trying to raise funds from industry, they state that the first question they are asked is, "What are the doctors doing about this?" They feel that it is certainly at least an equal task of the doctors as it is of industry to raise money to protect the freedom of our medical schools. Funds from industry are increasing, but they will only continue to increase as funds from the medical profession also continue to increase. So I hope, when you go back, you will stimulate your colleagues and your societies, if they have not already made contributions, to do so, so that we shall end this calendar year with more than we were able to present in the previous donation and that for 1956 we shall be able to increase that a great deal.

There has been some discussion that the AMEF interfered with the donations direct to colleges, but investigation and inquiry among the medical colleges has revealed the fact that since the AMEF was organized there has not been a single college at which the contributions have diminished; they have actually increased, so I do not think we have interfered with donations direct to the colleges not made through the Foundation. Of course, in reporting to industry what the doctors are doing, we report both what comes through the Foundation and also what is given direct to the schools.

Address of Dr. Leo H. Bartemeier, Joint Commission on Mental Illness and Health, Inc.

The Speaker introduced Dr. Leo H. Bartemeier, chairman of the board of trustees of the Joint Commission on Mental Illness and Health, who addressed the House as follows:

Mr. Speaker and Members of the House of Delegates: I am appearing before you today as the chairman of the board of trustees of the Joint Commission on Mental Illness and Health by the kind permission of your Speaker, Dr. Askey, and at the suggestion of President Elmer Hess to render a short report of the progress to date of the Joint Commission on Mental Illness and Health.

As you perhaps already know, the Council on Mental Health of the American Medical Association, with the express permission of the Board of Trustees, and the American Psychiatric Association have been spearheading for the past two years the development of a Joint Commission on Mental Illness and Health to carry out a nationwide analysis and reevaluation of the human and economic problems of mental illness and mental health of the nation. The organizational work incident to the setting up of the Joint Commission has now been completed, and we have been joined in this effort by some twenty other national organizations of the nonmedical and social professional groups. Fortunately for us there also has been in the last year and a half considerable thinking along similar lines of a necessity for such a study by members of Congress. This has resulted in an act of Congress passed in its recent session without one dissenting vote. This legislation created the so-called "Mental Health Study Act of 1955" which has become Public Law 182. This Act of Congress was most thoroughly supported by the Board of Trustees and the Committee on Legislation of the Association.

The joint commission itself has been incorporated under the laws of the District of Columbia. It has adopted bylaws and has appointed a Board of Trustees composed of 15 persons, 11 of whom are doctors and members of both the American Medical Association and American Psychiatric Association. Dr. Kenneth E. Appel of Philadelphia, a past-president of the American Psychiatric Association, has been elected president of the Joint Commission, and Dr. Jack R. Ewalt, presently commissioner of the Department of Mental Health of the Commonwealth of Massachusetts, has been appointed to the position of principal research investigator for the commission.

The funds made available by Congress under the Mental Health Study Act of 1955 amount to $1,250,000 to be expended over a period of three years. A sum of $250,000 has been appropriated for the first year of the study and the joint commission has already made application for these funds to start the work of the commission early in 1956. Some additional funds have already been made available to the commission by private foundations, and we confidently expect that funds from foundation sources will match or exceed the funds which are being made available by the federal government.

There has never been a thorough-going study and report of all of the aspects of our present resources, methods, and practices for the diagnosing, treating, caring for and rehabilitating the mentally ill. We feel therefore that the organization of the joint commission with proper financing offers a chance of a lifetime to develop guideposts for the American people that will point the way to a new attack on the staggering problem for the next 15 to 20 years.

Along with our Association and the American Psychiatric Association we have invited as initial organizational members of the commission representatives from the American Association on Mental Deficiency, the American Association of Psychiatric Clinics for Children, the American Bar Association, the American Occupational Therapy Association, the American Public Health Association, the Council of State Governments, the National Association for Mental Health, the National Institute of Mental Health, the National Rehabilitation Association, the Social Science Research Council, the U. S. Children's Bureau, the Office of Vocational Rehabilitation of the Department of Health, Education, and Welfare, and the Veterans Administration.

The joint commission during the past year has had a scientific study committee intensively occupied with a determination of the methods of work of the commission. A broad frame of approach has been delineated, and we believe that when the study and report is completed we shall be able to report to the Congress and to the professions concerned: (1) certainly an up-to-date description of the prevalence of mental disorders and the existing resources for and methods of dealing with these in regard to diagnosis, treatment, care, rehabilitation, and prevention, and an evaluation with respect to each; and (2) an examination of the formal and informal resources of our country and their organization and use in dealing with the mental health of our people. Out of such an examination we believe will come a radical reconceptualization of our problems and a reconstruction of these institutions so that they can be more economically used and mental health and illness can be better served.

We realize that this is going to be a tremendous undertaking, and therefore I would like to ask now for all the help and support that I know you are going to be able to give us toward achieving a successful outcome. The commission hopes that through this survey and report it will be able to accomplish in the field of mental health what was similarly accomplished by the "Flexner report" and its subsequent follow-up in achieving the optimum in standards of medical education in the United States.

Presentation and Address of President of Woman's Auxiliary

Mrs. Mason G. Lawson, President of the Woman's Auxiliary, was presented to the House by the Speaker, and delivered the following address:

Members of the House of Delegates of the American Medical Association and Guests: On behalf of the 71,205 members of your Woman's Auxiliary, I extend my appreciation to you for this opportunity to present a brief progress report on our activities during this first half of the current fiscal year.

"Active Leadership in Community Health," our program theme, is projected into all of our activity. As your Auxiliary, we believe that our principal role is that of the volunteer in health education. We are aware that only a properly informed member can achieve this goal so that consequently our program is one of intensive study as well as one of action. We are gratified that each year many more of the national organizations concerned with health are seeking our assistance in their health education program. This, we feel, is not only recognition of the prestige the Woman's Auxiliary enjoys among the national women's organizations, but an increased awareness of our ability to achieve the desired results. This year, the American Cancer Society has prepared material especially designed for the Auxiliary's use in health education. We also recognize the great challenge to community health resources that are offered by the cardiovascular diseases and plan to cooperate with the

American Heart Association in its program of public education. In addition, we shall continue our individual support of all of the other voluntary health organizations, such as poliomyelitis and tuberculosis.

Increasing the interest of state and county auxiliaries and the individual members of the American Medical Education Foundation is one of our most important projects. We are confident that this will result in a substantial increase in our annual contribution to the American Medical Education Foundation in June of 1956. During National Medical Education Week, April 22-28, 1956, we shall participate in the 80 Dimes Campaign, and hope that through this pioneering effort, the lay people of the country will become yearly contributors to the National Fund for Medical Education.

Our Committee on Legislation has been expanded to parallel the American Medical Association committee. We now have, in addition to our chairman, 10 regional chairmen. We are concentrating our efforts in those areas of legislation in which we can be most effective. These chairmen, as well as many other Auxiliary members, attended the American Medical Association Legislative Conference held in their area.

The recruitment program has been broadened to cover not only nurses but recruitment in other fields allied with medicine, such as technologists, physical and occupational therapists, and, in some instances, medical social workers. We recognize the need for trained personnel in these areas of medicine and the shortage which now exists.

The *Bulletin*, our official publication, has almost doubled in subscriptions since June. We are also experiencing the best year to date in obtaining subscriptions to *Today's Health*. Each county auxiliary has been urged to help plan and carry out an informational program or project for public education during Mental Health Week, April 29-May 5, 1956. Every Auxiliary member has been urged to cooperate with her local Civil Defense Administration and to become trained to assist her community in the event of a local or national disaster. At our recent Study Conference in Chicago, the national Auxiliary very proudly received a Distinguished Service award from the Crusade for Freedom for its efforts in their behalf. We are also cooperating with the American Heritage Foundation in their Register and Vote Campaign. One of our newest projects is a survey to determine the contribution of both time and money which the physicians give to their community. This will be done by local auxiliaries and only with the permission of their local society. A joint committee from the national Auxiliary and the American Medical Association Council on Rural Health is engaged in a series of study conferences to explore the areas in which the Auxiliary can participate more effectively in the rural health program.

I have personally visited 13 states since June, and immediately following this meeting I shall visit the District of Columbia. Six additional states and the Territory of Hawaii have been visited by a national officer or chairman. Incidentally, the visit to Hawaii did not cost us anything. Including this session, I have attended eight meetings sponsored by the American Medical Association or one of its departments. Committee chairmen have attended all Association departmental meetings which concern their field of activity. I attended the annual convention of the Auxiliary to the Southern Medical Association, a regional conference of the National Foundation for Infantile Paralysis, and the National Safety Congress, where I participated in the first Conference on Women's Activities. I also attended a Traffic Safety Institute at Northwestern University which was sponsored by the President's Committee for Traffic Safety, served as a judge of the Carol Lane Safety Awards, and made a trailer to the film on medical education, "Danger at the Source." Following this meeting, I shall be present at a Joint Conference on Children and Youth and shall attend the Congress of Industry at the invitation of the National Association of Manufacturers. Immediately following that meeting, I shall be present at a luncheon given by the President of the National Fund for Medical Education for National Women's Organizational Presidents and have been asked to speak to that group.

The Auxiliary has had help from many sources in the promotion of its program and objectives. Although our central office staff is smaller than that of any other comparable women's organization, consisting of only four employees in addition to Miss Margaret Wolfe, our Executive Secretary, we are confident that it is second to none in the efficiency of its operation. We are grateful to Dr. Hess, Dr. Lull, the members of our Advisory Committee, the Board of Trustees, and to the departments and employees of the American Medical Association who have given us much valuable assistance. We want especially to thank Dr. Ernest B. Howard, who serves as the liaison officer between the Auxiliary and the Board of Trustees. We rely on his judgment, and we appreciate his trust and the great amount of time he so freely gives us.

In closing, I would remind you that your county and state auxiliaries are only as alert and enthusiastic as their parent medical associations. Auxiliary activity depends solely on your leadership and direction. Your Auxiliary does not wish to be "out in front," but rather we are content to be your most ardent and resolute followers. I can assure you, without any reservations, that you will have the unified support of your Auxiliary in any project or program which you wish them to undertake. Again, thank you for the privilege of giving this semiannual report to you. It has been a pleasure to be with you.

Introduction of Student A. M. A. Delegates

The Student A. M. A. delegates, Mr. Hugh C. Follmer, Vice President of the student organization, and Mr. Harry D. Wilson Jr., Treasurer, were introduced to the House by the Speaker, who stated that Mr. Follmer was from the University of Nebraska College of Medicine and Mr. Wilson from the University of Maryland School of Medicine and College of Physicians and Surgeons.

Presentation of Scroll by Korean Medical Association Vice President

The Speaker introduced Dr. Chung Kuchoong, Vice President of the Korean Medical Association and Chairman of the Seoul Medical Society, who presented to the Chairman of the Board of Trustees, Dr. Gunnar Gundersen, a scroll and the following communication:

To: Chairman
American Medical Association

I, on behalf of the members of this association, wish to express my heartfelt thanks for your immeasurable contribution for the prosperity of this association.

Sincerely yours,
LL Sun Yun
President
Korean Medical Association

Introduction of Representative of American Medical Society of Vienna

Dr. M. Arthur Kline, Executive Secretary of the American Medical Society of Vienna, Austria, was introduced by the Speaker, who stated that Dr. Kline had been of great help to members of the American Medical Association visiting in Europe.

Address of the President, Dr. Elmer Hess

Dr. Elmer Hess, President, delivered his address, which was referred to the Reference Committee on Reports of Officers. (See Dr. Hess' address in The Journal, Dec. 17, 1955, pages 1545-1547.)

REPORT OF REFERENCE COMMITTEE ON REPORTS OF OFFICERS

Dr. Wesley W. Hall, Chairman, Nevada, submitted the following report, which was adopted:

Address of the President: The theme of every address presented across the length and breadth of our land by President Hess bears additional emphasis. It is, "Doctors take care of sick folks, period!"

Some of the points stressed in this very able address were: (1) Complacency should be regarded as our greatest enemy; (2) every doctor should learn the wide scope and importance of the activities of the American Medical Association as reported in The Journal of the American Medical Association, especially the Oct. 29, 1955, issue, pages 878-947; (3) there should be wide recognition of the extensive activities of the councils, particularly the Council on Mental Health; (4) a complete reevaluation of the Social Security program to date should be carried out before any new additions are considered; (5) deviation of ethical standards should be settled at a local level—these may vary somewhat geographically; (6) medical, lay, and other professional groups should get together for joint meetings. It is the firm belief of President Hess that "reasonable men can sit down around a table and settle a problem." This applies to all our controversial issues; and (7) several plans are in contemplation to aid in the problem of career medical men for the armed forces.

Your reference committee, with sincere pride, wishes to commend President Hess for his untiring efforts and his tremendous ability in carrying the message of true medicine to all people of this country. We pay tribute to him as a magnificent ambassador in interpreting the principles and objectives of the American Medical Association and correcting the misunderstandings of so many uninformed elements. His philosophy may be embraced in these words, "The welfare of the patient supersedes everything else, and doctors, take care of sick folks, period!"

Report of the Secretary

Dr. George F. Lull, Secretary, presented his report (see The Journal, Oct. 29, 1955, pages 878-879), which was referred to the Reference Committee on Reports of Board of Trustees and Secretary with the exception of the final paragraph of the portion entitled, "Actions of the House of Delegates," which was referred to the Reference Committee on Amendments to the Constitution and Bylaws.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Homer M. Izumi, Chairman, presented the following report, which was adopted:

Membership: Your reference committee is pleased to note the continued increase in membership in the American Medical Association. The total membership for the year ending June 30, 1955, of 155,878, represented a gain of 6,567 over the same period for 1954. The total number of members at present exceeds by several thousand the number reported in any previous year, even including years when there were no membership dues. Your committee feels this growth is a reflection of the profession's approval of the policies of the Association. However, our Secretary notes that for 1955 some 7,649 physicians had not as yet established their American Medical Association membership. A list of these physicians has been forwarded to the secretary of each constituent society, and direct notices have been mailed to each of these physicians in order that their American Medical Association membership may be preserved. Your committee commends this action and urges the cooperation of all constituent societies having members in this category. Your committee notes that many constituent and component societies have cooperated in revising their membership regulations to conform with the Association's Constitution and Bylaws. It urges those societies which have not done so to make every effort to conform with this pattern.

Actions of House of Delegates at 1955 Annual Meeting: In a special letter to the constituent state and territorial medical associations, the Secretary called attention, for reference and implementation as indicated, to the actions of the House of Delegates at its Atlantic City session in June. Of these, Resolutions No. 71 and No. 27 are significant:

Copies of Resolution No. 71 on the Draft of Medical Students were sent to the President of the United States and to all members of Congress. Briefly, this resolution protested against the drafting of students who interrupted temporarily their medical education to become instructors in schools of medicine. The national Selective Service System under General Hershey has been cognizant of this problem and has requested local boards to give careful consideration to the occupational deferment of any registrant who becomes a teacher in any of the fields of physical and biological science, mathematics, medicine, and dentistry. Your committee highly commends this action.

Resolution No. 27 on Presumption of Service-Connected Disabilities was sent to the Administrator of Veterans' Affairs and the chairmen of the appropriate committees of the House and Senate. This resolution placed the American Medical Association in opposition to the establishment of "service connection by presumption" for disability developing after military service and, in addition, urged the establishment of service connection for disability on an individual evaluation based on scientific medical evidence.

Field Activity: The Secretary and Assistant Secretary in the past year have been even more active than previously in attending and addressing medical meetings. Your committee believes that this increased activity at its grass roots level is mutually beneficial to all members of the profession and to the Association.

Your reference committee wishes to express for the House of Delegates grateful appreciation to our Secretary, to our Assistant Secretary and to all personnel of the Association for their outstanding service.

Report of the Board of Trustees

Dr. Gunnar Gundersen, Chairman, presented the report of the Board of Trustees (see The Journal, Oct. 29, 1955, pages 879-926), which was referred to the Reference Committee on Reports of Board of Trustees and Secretary with the following *exceptions:*

Report of Department of Public Relations, Report of Washington Office, and Report of Committee on Legislation to the Reference Committee on Legislation and Public Relations.

Report of Council on Industrial Health, Report of Council on Mental Health, and Report of Bureau of Health Education to the Reference Committee on Hygiene, Public Health, and Industrial Health.

Report of Council on Rural Health and Report of Council on Medical Service to the Reference Committee on Insurance and Medical Service.

Report of Council on National Defense to the Reference Committee on Medical Military Affairs.

Report of Council on Scientific Assembly and of Bureau of Exhibits to the Reference Committee on Sections and Section Work.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr Homer M. Izumi, Chairman, Hawaii, presented the following report, which was adopted:

Geriatrics: In response to a directive of the House of Delegates a Committee on Geriatrics was appointed to function under the Council on Medical Service. The broad objective of this committee will be to outline basic problems of geriatrics and methods for approaching these problems. Your reference committee endorses these objectives.

Resolution on Reimbursement for Collecting American Medical Association Dues: This resolution introduced at the June meeting in Atlantic City on behalf of the New York delegation would direct full reimbursement of constituent societies for expenses in collecting and transmitting American Medical Association dues. After a discussion of this problem with members of the New York delegation and Association officials, it appears that efforts are now being made to effect economies in the collection of dues. Therefore, your reference committee concluded that the present method of allocation of 1% of dues is ample to cover expenses. Your committee concurs with the recommendation of the Board of Trustees that no changes be made in the present policy.

Resolution on Introduction of Committee Reports: This resolution, also introduced at the Atlantic City meeting, would require all committee reports to be submitted to the Association sufficiently early to be transmitted to members of the House not less than 30 days prior to the meeting at which they are to be introduced, and that all reports not so submitted be deferred for introduction until a later meeting unless exception be made by a two-thirds vote of the House. The Board of Trustees believes the intent of this resolution is sound but that its implementation is impractical. Your committee is in accord with the Board's opinion on this matter, but would urge all delegates to take cognizance of this principle and make every effort to comply with its intent.

The Journal of the American Medical Association and the Specialty Journals: THE JOURNAL continues to expand its activities in keeping with the needs and demands of the profession. In addition to high caliber scientific articles and abstracts, valuable and interesting information is reported under such titles as the President's Page, the Organization Section, and the Washington News. These items, often medicoeconomic in nature, are clearly presented. The articles on Medicine and the Law, Public Relations, and Federal Medical Legislation are a few of the more recent innovations that your committee commends for informative brevity.

Your committee is pleased to note the continued efforts at improvement of the specialty journals, particularly in the format, the expanded use of color reproductions, and new editorial features. The intensified promotional campaign to gain new subscribers for THE JOURNAL as well as the specialty journals merits commendation by the House and your committee so recommends.

Registration at Meetings: Your committee is pleased to note that substantial economies in the operation of the Registration Bureau have been accomplished, and wishes to compliment the Director and the Registration Bureau for their efficient management.

Library and Standard Nomenclature of Diseases and Operations: Your committee notes with satisfaction that the profession is continuing to make substantial use of the library facilities of the Association.

The Standard Nomenclature of Diseases and Operations is now being used in almost 85% of the nation's hospitals. Your committee is pleased to note the increasing popularity of the Nomenclature in doctors' offices and clinics. It commends the Association's sponsorship of the several institutes held for medical record librarians and medical office personnel during the year. Your committee, aware of the need for improving the precision and uniformity of medical terminology, urges that further institutes be sponsored on a regional basis if possible.

Today's Health: Your committee is pleased to note great improvement in *Today's Health* from the standpoint of appearance, content, and salability. The average net paid circulation for the first six months of 1955 was the highest figure ever established for the magazine. This gain has been largely due to "Operation MD-DDS" of the medical society auxiliaries. Your committee takes this opportunity to recognize and commend this splendid contribution of our Woman's Auxiliary, and urges the support of all component and constituent societies in the current project of obtaining 63,000 new subscriptions by May, 1956.

Report of Law Department: This is the first report of the Law Department, which was established last year. The Department has continued the medicolegal services rendered by the former Bureau of Legal Medicine and Legislation and has initiated new programs that should be of substantial value to the public and to the medical profession. In addition to their regular legal duties, members of the staff serve as secretaries or liaison personnel to various councils or committees, and this arrangement has resulted in the elimination of duplication, and has increased efficiency. These staff members are available to answer legal questions of councils or committees and to assist in the preparation of statements of policy involving legal issues.

The Department has established contact with executive secretaries and legal counsel for state medical societies. It has also assisted in the preparation of articles and editorials having legal implications. The Department has started an extensive survey dealing with professional liability. In collaboration with the Committee on Medicolegal Problems, information is being assembled on experiences in group professional liability insurance coverage, and claims prevention programs. Your committee is mindful of the importance of these surveys and urges the cooperation of the medical profession.

The Department has continued to promote periodic joint meetings between physicians and lawyers at which subjects of mutual interest are explored. This is a healthy development that should be encouraged by national, state, and local medical and legal organizations. Three American Medical Association regional medicolegal symposiums have been held in which the response has been very gratifying. It is hoped that meetings of this type will be sponsored annually in cooperation with the American Bar Association. Your committee agrees such joint meetings can be effective in reducing areas of misunderstanding that exist between the medical and legal profession and can do much to assure the proper administration of justice in medicolegal cases. Your committee highly commends the Law Department for its accomplishments during the first year of its existence.

Miscellaneous Reports: Your reference committee carefully considered the reports of the Committee on Medicolegal Problems, Committee on Pesticides, Committee on Toxicology, Committee on Research, Committee on Cosmetics, Council on Pharmacy and Chemistry, Council on Rehabilitation, Council on Foods and Nutrition, and Bureau of Investigation. In the opinion of your committee the work of these groups has been carried on actively and in the best interests of the profession. The termination of the seal-acceptance program has allowed many of these groups to broaden their scope and to improve their service to the public and the profession.

Report of Bureau of Medical Economic Research: This Bureau continues to provide accurate data on medicoeconomic problems, and is now undertaking a study of the totality of services which physicians render to the American people. An interesting sidelight of this study is from Bulletin 97, "Ages and Sex Distribution of Hospital Patients," where an unexpected excess of male patients in American hospitals is reported. These studies reveal that federal hospitals account for this excess.

Your committee commends the Bureau in its active participation in support of the Jenkins-Keogh type of bills and the concept of voluntary retirement plans for the self-employed.

Your committee recommends that the scientific and factual reports of this Bureau should be made available in popular and nontechnical language for the enlightenment of the general public on medicoeconomic problems and further recommends to the Board of Trustees that it give careful consideration to this recommendation.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, presented the following report, which was adopted:

Department of Public Relations, Washington Office, and Committee on Legislation: Your reference committee commends the directors of the Department of Public Relations, the Washington Office, and the Committee on Legislation for their fine reports. Your committee does, however, desire to make the following comment concerning "Title III, S. 886," which reads:

> This title of the administration's omnibus health bill would authorize the appropriation of 17 million dollars in gradually increasing annual amounts over a five year period, as grants-in-aid to the states for the vocational training of practical nurses. The federal share of approved projects would be 75% the first and second years and 50% in the remaining three years. The program would be carried out through state boards of vocational education. The position of the Association was one of opposition to the underlying theory of the bill. This position was presented by Dr. Cleon A. Nafe before the Subcommittee on Health of the Committee on Labor and Public Welfare of the Senate on April 14, 1955. The position was taken because of the belief that it was neither necessary nor wise for the federal government to enter the area of state responsibility for vocational education unless an emergency were clearly demonstrated. The Association urged a fact-finding survey.

While your committee feels that there is a shortage of nurses, at the same time it is convinced that there are available funds for this purpose at the local and state levels, already supported under the Vocational Education Act, and therefore recommends that vocational training of practical nurses be encouraged by the state medical societies.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, presented the following report, which was adopted:

Report of Council on Industrial Health: Your committee approves that portion of the report dealing with workmen's compensation in its entirety, with one change in verbiage in point 4 under the heading, "Statutory Provisions," which reads "able" and is changed to "qualified."

Your committee approves all of the following items in the report: Medical Relations in Workmen's Compensation, including the Medical Profession's Interest in Workmen's Compensation; Goals of Workmen's Compensation; Implementation of These Goals; Rehabilitation of the Occupationally Disabled; Statutory Provisions; Planned Cooperation from the Medical Profession; Role of Individual Physician; Administrative Supervision; and Indemnity.

Your committee also approves all of the following items in the report: Medical Rating of Physical Impairment; Progress of Preventive Medicine in Industry; Local or Community Approach to Industrial Health Problems; Medical Care for Industrial Workers; Improved Educational Standards; Scientific Development; and Interprofessional Relations.

You will note your reference committee did not take any action on that portion of the report having to do with the "Evaluation of Management and Union Health Centers" because your committee believes this portion of the report was specifically considered by the Reference Committee on Insurance and Medical Service.

Your committee considered Supplementary Report of the Board of Trustees J, on "Physician Selection in Workmen's Compensation," which was pertinent to the Council on Industrial Health, and your committee approves this recommendation with the exception of the change in verbiage as above stated from the word "able" to "qualified."

Your committee compliments the Council on Industrial Health for its excellent and comprehensive report, which was prepared by Dr. Carl M. Peterson, Secretary, prior to his tragic death.

Report of the Council on Mental Health: Your committee approves the report of the Council on Mental Health, which embraces the following items for action and consideration: Conference of Mental Health Representatives of State Medical Associations; Joint Commission on Mental Illness and Health, Inc. (except for an error in the last paragraph, corrected to read October, 1956, instead of October, 1955, as printed); Committee on Alcoholism; Mass Mediums; Headquarters; and Future Plans.

This approval is with the exclusion of that portion of the report on "Licensure or Certification of Clinical Psychologists," which your committee considered in Supplementary Report of Board of Trustees O, on "Clinical Psychologists."

Report of the Bureau of Health Education: Your committee approves this report in its entirety and wishes to direct your attention to the many ramifications of the interests and functions of the Bureau, such as Loan Collections; Manuscripts, Book Reviews, etc.; Radio and Television; Radio and Television from Clinical and Annual Meetings; Local Broadcasts; Health and Physical Fitness Division; Bureau Publications; Meetings and Conferences; Cooperative Relationships; and Joint Committee on Health Problems in Education.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, which was adopted:

Report of Council on Rural Health: It is noted that the Council on Rural Health has been very active at the grass roots level as well as in constituent and component societies through its regional directors and their assistants. With the country divided into nine regions and programs suggested to fit the particular requirements of the rural dwellers in those regions, much has been accomplished in the organization and sponsorship of health conferences and in the participation in other activities of the farm organizations. It is particularly commendable that this program has been presented in such a manner as to promote active cooperation between the medical profession and the individuals and farm groups. As a result of these activities, the Council notes rapidly increasing good will and requests for further service. This is public relations of a practical kind and of inestimable value.

Report of Council on Medical Service: In this compact report is found a story that cannot be epitomized because it represents pure essence of devoted service and constant and unceasing activity with tenacity in working toward the stated goals. It is to be observed that the Council on Medical Service during the past year has worked on over 60 projects, with 20 projects completed during the past year.

NOTE: The report of the reference committee on the item entitled Guiding Principles for Evaluating Management and Union Health Centers, in the report of the Council will be found following Resolution No. 26.—ED.

REPORT OF REFERENCE COMMITTEE ON MEDICAL MILITARY AFFAIRS

Dr. Charles H. Richardson Sr., Georgia, presented the following report, which was adopted:

Your reference committee has carefully reviewed the annual report of the Council on National Defense. The committee notes that the Council has established a Committee on Military Medical Affairs and a Committee on Civil Defense and commends the Council for taking this logical and appropriate action. Your reference committee is in accord that the major responsibilities of the Council can be discharged more effectively and expeditiously through these committees.

The committee notes with satisfaction that the Council has taken cognizance of a major problem of the armed forces, namely, the provision for a career incentive program for medical officers. It is abundantly apparent that the career service must be made attractive and that an adequate corps of career medical officers must be recruited and retained if the medical services of the armed forces are to flourish and the "Doctor-Draft" law not be further extended. It is recalled that this House of Delegates at the Atlantic City Annual Meeting, June, 1955, expressed an urgent need to fortify a career incentive program for medical officers and urged that the Department of Defense take appropriate action. We note with admiration and satisfaction that President Elmer Hess in his address before this assembly at its opening session stated that the problem was critical and suggested positive leadership by the American Medical Association in solving this important problem. The Council report discloses that 48% of the authorized regular medical officer positions are unfilled, which depicts the current status of this problem. The proposed career incentive program for medical officers recently promulgated by the Department of Defense is quite obviously a positive step in the right direction and is endorsed in principle. Some of the requirements listed in the Council report are incorporated in the proposed program. They would seem to correct some of the gross inequities of the current situation. Your reference committee urges that the American Medical Association through its Board of Trustees and Council on National Defense actively cooperate with the Department of Defense and offer such assistance as is necessary to implement this program both legislatively and administratively.

Your committee noted with interest the activities of the Council on National Defense in maintaining liaison with physicians in the armed services. This action is a most desirable service carried on by monthly articles prepared by the Council and published in the *U. S. Armed Forces Medical Journal.* Appreciation is expressed to the Department of Defense for its cooperation and active participation in permitting these communications to be published. The Council also should be commended for its efforts in this connection.

Your reference committee endorses the action of the American Medical Association through its Council on National Defense in conducting, on a continuing basis, a survey of discharged medical personnel. This survey provides valuable information on the utilization of physicians in uniform and supplies information of value to the military medical services. In connection with this survey, assistance is furnished to physicians being released from active military service by providing information on available civilian positions. The favorable responses and high participation of the physicians clearly indicates that the program is worthwhile and forms the basis for your committee's endorsement. These services provide a vehicle for contact with the military physicians and gives evidence of the over-all interest of the American Medical Association.

Your reference committee noted with interest that portion of the report pertaining to medical care for dependents of Service personnel. An active discussion took place on this subject with

The Journal of the American Medical Association and the Specialty Journals: THE JOURNAL continues to expand its activities in keeping with the needs and demands of the profession. In addition to high caliber scientific articles and abstracts, valuable and interesting information is reported under such titles as the President's Page, the Organization Section, and the Washington News. These items, often medicoeconomic in nature, are clearly presented. The articles on Medicine and the Law, Public Relations, and Federal Medical Legislation are a few of the more recent innovations that your committee commends for informative brevity.

Your committee is pleased to note the continued efforts at improvement of the specialty journals, particularly in the format, the expanded use of color reproductions, and new editorial features. The intensified promotional campaign to gain new subscribers for THE JOURNAL as well as the specialty journals merits commendation by the House and your committee so recommends.

Registration at Meetings: Your committee is pleased to note that substantial economies in the operation of the Registration Bureau have been accomplished, and wishes to compliment the Director and the Registration Bureau for their efficient management.

Library and Standard Nomenclature of Diseases and Operations: Your committee notes with satisfaction that the profession is continuing to make substantial use of the library facilities of the Association.

The Standard Nomenclature of Diseases and Operations is now being used in almost 85% of the nation's hospitals. Your committee is pleased to note the increasing popularity of the Nomenclature in doctors' offices and clinics. It commends the Association's sponsorship of the several institutes held for medical record librarians and medical office personnel during the year. Your committee, aware of the need for improving the precision and uniformity of medical terminology, urges that further institutes be sponsored on a regional basis if possible.

Today's Health: Your committee is pleased to note great improvement in *Today's Health* from the standpoint of appearance, content, and salability. The average net paid circulation for the first six months of 1955 was the highest figure ever established for the magazine. This gain has been largely due to "Operation MD-DDS" of the medical society auxiliaries. Your committee takes this opportunity to recognize and commend this splendid contribution of our Woman's Auxiliary, and urges the support of all component and constituent societies in the current project of obtaining 63,000 new subscriptions by May, 1956.

Report of Law Department: This is the first report of the Law Department, which was established last year. The Department has continued the medicolegal services rendered by the former Bureau of Legal Medicine and Legislation and has initiated new programs that should be of substantial value to the public and to the medical profession. In addition to their regular legal duties, members of the staff serve as secretaries or liaison personnel to various councils or committees, and this arrangement has resulted in the elimination of duplication, and has increased efficiency. These staff members are available to answer legal questions of councils or committees and to assist in the preparation of statements of policy involving legal issues.

The Department has established contact with executive secretaries and legal counsel for state medical societies. It has also assisted in the preparation of articles and editorials having legal implications. The Department has started an extensive survey dealing with professional liability. In collaboration with the Committee on Medicolegal Problems, information is being assembled on experiences in group professional liability insurance coverage, and claims prevention programs. Your committee is mindful of the importance of these surveys and urges the cooperation of the medical profession.

The Department has continued to promote periodic joint meetings between physicians and lawyers at which subjects of mutual interest are explored. This is a healthy development that should be encouraged by national, state, and local medical and legal organizations. Three American Medical Association regional medicolegal symposiums have been held in which the response has been very gratifying. It is hoped that meetings of this type will be sponsored annually in cooperation with the American Bar Association. Your committee agrees such joint meetings can be effective in reducing areas of misunderstanding that exist between the medical and legal profession and can do much to assure the proper administration of justice in medicolegal cases. Your committee highly commends the Law Department for its accomplishments during the first year of its existence.

Miscellaneous Reports: Your reference committee carefully considered the reports of the Committee on Medicolegal Problems, Committee on Pesticides, Committee on Toxicology, Committee on Research, Committee on Cosmetics, Council on Pharmacy and Chemistry, Council on Rehabilitation, Council on Foods and Nutrition, and Bureau of Investigation. In the opinion of your committee the work of these groups has been carried on actively and in the best interests of the profession. The termination of the seal-acceptance program has allowed many of these groups to broaden their scope and to improve their service to the public and the profession.

Report of Bureau of Medical Economic Research: This Bureau continues to provide accurate data on medicoeconomic problems, and is now undertaking a study of the totality of services which physicians render to the American people. An interesting sidelight of this study is from Bulletin 97, "Ages and Sex Distribution of Hospital Patients," where an unexpected excess of male patients in American hospitals is reported. These studies reveal that federal hospitals account for this excess.

Your committee commends the Bureau in its active participation in support of the Jenkins-Keogh type of bills and the concept of voluntary retirement plans for the self-employed.

Your committee recommends that the scientific and factual reports of this Bureau should be made available in popular and nontechnical language for the enlightenment of the general public on medicoeconomic problems and further recommends to the Board of Trustees that it give careful consideration to this recommendation.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, presented the following report, which was adopted:

Department of Public Relations, Washington Office, and Committee on Legislation: Your reference committee commends the directors of the Department of Public Relations, the Washington Office, and the Committee on Legislation for their fine reports. Your committee does, however, desire to make the following comment concerning "Title III, S. 886," which reads:

> This title of the administration's omnibus health bill would authorize the appropriation of 17 million dollars in gradually increasing annual amounts over a five year period, as grants-in-aid to the states for the vocational training of practical nurses. The federal share of approved projects would be 75% the first and second years and 50% in the remaining three years. The program would be carried out through state boards of vocational education. The position of the Association was one of opposition to the underlying theory of the bill. This position was presented by Dr. Cleon A. Nafe before the Subcommittee on Health of the Committee on Labor and Public Welfare of the Senate on April 14, 1955. The position was taken because of the belief that it was neither necessary nor wise for the federal government to enter the area of state responsibility for vocational education unless an emergency were clearly demonstrated. The Association urged a fact-finding survey.

While your committee feels that there is a shortage of nurses, at the same time it is convinced that there are available funds for this purpose at the local and state levels, already supported under the Vocational Education Act, and therefore recommends that vocational training of practical nurses be encouraged by the state medical societies.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, presented the following report, which was adopted:

Report of Council on Industrial Health: Your committee approves that portion of the report dealing with workmen's compensation in its entirety, with one change in verbiage in point 4 under the heading, "Statutory Provisions," which reads "able" and is changed to "qualified."

Your committee approves all of the following items in the report: Medical Relations in Workmen's Compensation, including the Medical Profession's Interest in Workmen's Compensation; Goals of Workmen's Compensation; Implementation of These Goals; Rehabilitation of the Occupationally Disabled; Statutory Provisions; Planned Cooperation from the Medical Profession; Role of Individual Physician; Administrative Supervision; and Indemnity.

Your committee also approves all of the following items in the report: Medical Rating of Physical Impairment; Progress of Preventive Medicine in Industry; Local or Community Approach to Industrial Health Problems; Medical Care for Industrial Workers; Improved Educational Standards; Scientific Development; and Interprofessional Relations.

You will note your reference committee did not take any action on that portion of the report having to do with the "Evaluation of Management and Union Health Centers" because your committee believes this portion of the report was specifically considered by the Reference Committee on Insurance and Medical Service.

Your committee considered Supplementary Report of the Board of Trustees J, on "Physician Selection in Workmen's Compensation," which was pertinent to the Council on Industrial Health, and your committee approves this recommendation with the exception of the change in verbiage as above stated from the word "able" to "qualified."

Your committee compliments the Council on Industrial Health for its excellent and comprehensive report, which was prepared by Dr. Carl M. Peterson, Secretary, prior to his tragic death.

Report of the Council on Mental Health: Your committee approves the report of the Council on Mental Health, which embraces the following items for action and consideration: Conference of Mental Health Representatives of State Medical Associations; Joint Commission on Mental Illness and Health, Inc. (except for an error in the last paragraph, corrected to read October, 1956, instead of October, 1955, as printed); Committee on Alcoholism; Mass Mediums; Headquarters; and Future Plans.

This approval is with the exclusion of that portion of the report on "Licensure or Certification of Clinical Psychologists," which your committee considered in Supplementary Report of Board of Trustees O, on "Clinical Psychologists."

Report of the Bureau of Health Education: Your committee approves this report in its entirety and wishes to direct your attention to the many ramifications of the interests and functions of the Bureau, such as Loan Collections; Manuscripts, Book Reviews, etc.; Radio and Television; Radio and Television from Clinical and Annual Meetings; Local Broadcasts; Health and Physical Fitness Division; Bureau Publications; Meetings and Conferences; Cooperative Relationships; and Joint Committee on Health Problems in Education.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, which was adopted:

Report of Council on Rural Health: It is noted that the Council on Rural Health has been very active at the grass roots level as well as in constituent and component societies through its regional directors and their assistants. With the country divided into nine regions and programs suggested to fit the particular requirements of the rural dwellers in those regions, much has been accomplished in the organization and sponsorship of health conferences and in the participation in other activities of the farm organizations. It is particularly commendable that this program has been presented in such a manner as to promote active cooperation between the medical profession and the individuals and farm groups. As a result of these activities, the Council notes rapidly increasing good will and requests for further service. This is public relations of a practical kind and of inestimable value.

Report of Council on Medical Service: In this compact report is found a story that cannot be epitomized because it represents pure essence of devoted service and constant and unceasing activity with tenacity in working toward the stated goals. It is to be observed that the Council on Medical Service during the past year has worked on over 60 projects, with 20 projects completed during the past year.

NOTE: The report of the reference committee on the item entitled Guiding Principles for Evaluating Management and Union Health Centers, in the report of the Council will be found following Resolution No. 26.—ED.

REPORT OF REFERENCE COMMITTEE ON MEDICAL MILITARY AFFAIRS

Dr. Charles H. Richardson Sr., Georgia, presented the following report, which was adopted:

Your reference committee has carefully reviewed the annual report of the Council on National Defense. The committee notes that the Council has established a Committee on Military Medical Affairs and a Committee on Civil Defense and commends the Council for taking this logical and appropriate action. Your reference committee is in accord that the major responsibilities of the Council can be discharged more effectively and expeditiously through these committees.

The committee notes with satisfaction that the Council has taken cognizance of a major problem of the armed forces, namely, the provision for a career incentive program for medical officers. It is abundantly apparent that the career service must be made attractive and that an adequate corps of career medical officers must be recruited and retained if the medical services of the armed forces are to flourish and the "Doctor-Draft" law not be further extended. It is recalled that this House of Delegates at the Atlantic City Annual Meeting, June, 1955, expressed an urgent need to fortify a career incentive program for medical officers and urged that the Department of Defense take appropriate action. We note with admiration and satisfaction that President Elmer Hess in his address before this assembly at its opening session stated that the problem was critical and suggested positive leadership by the American Medical Association in solving this important problem. The Council report discloses that 48% of the authorized regular medical officer positions are unfilled, which depicts the current status of this problem. The proposed career incentive program for medical officers recently promulgated by the Department of Defense is quite obviously a positive step in the right direction and is endorsed in principle. Some of the requirements listed in the Council report are incorporated in the proposed program. They would seem to correct some of the gross inequities of the current situation. Your reference committee urges that the American Medical Association through its Board of Trustees and Council on National Defense actively cooperate with the Department of Defense and offer such assistance as is necessary to implement this program both legislatively and administratively.

Your committee noted with interest the activities of the Council on National Defense in maintaining liaison with physicians in the armed services. This action is a most desirable service carried on by monthly articles prepared by the Council and published in the *U. S. Armed Forces Medical Journal.* Appreciation is expressed to the Department of Defense for its cooperation and active participation in permitting these communications to be published. The Council also should be commended for its efforts in this connection.

Your reference committee endorses the action of the American Medical Association through its Council on National Defense in conducting, on a continuing basis, a survey of discharged medical personnel. This survey provides valuable information on the utilization of physicians in uniform and supplies information of value to the military medical services. In connection with this survey, assistance is furnished to physicians being released from active military service by providing information on available civilian positions. The favorable responses and high participation of the physicians clearly indicates that the program is worthwhile and forms the basis for your committee's endorsement. These services provide a vehicle for contact with the military physicians and gives evidence of the over-all interest of the American Medical Association.

Your reference committee noted with interest that portion of the report pertaining to medical care for dependents of Service personnel. An active discussion took place on this subject with comments from a large array of interested physicians in attendance. It is concluded that the Board of Trustees is completely cognizant of the problem and has taken a very active role in negotiating with the Department of Defense along the lines of obtaining a solution through an acceptable prepaid medical care program and utilization, where feasible, of civilian practitioners and civilian medical treatment facilities.

Your reference committee notes with satisfaction the two civil defense meetings held annually by the Council on National Defense and commends its Committee on Civil Defense together with the Council staff for the effective manner in which the medical activities of civil defense are made an important and continuing aspect of medical practice. With the contemplated delivery of 200-bed emergency Civil Defense hospitals to local communities, your reference committee urges that state and county medical societies give renewed interest and emphasis to the importance of local participation in Civil Defense training and the furnishing of medical leadership in solving the problems of community disaster medical care.

REPORT OF REFERENCE COMMITTEE ON SECTIONS AND SECTION WORK

Dr. Gilson Colby Engel, Chairman, Pennsylvania, read the following report, which was adopted:

Report of Council on Scientific Assembly: The report of the Council on Scientific Assembly shows that it held five meetings during the past year and discussed many problems confronting it, such as publication of scientific exhibits, attendance at section meetings, deadline for requests to read section papers, requests for new sections, and the setting up of a panel on mental health. It also changed the personnel of the Fracture Committee and considered the Ciba reports and closer affiliation with the sections, and elected a new chairman, Dr. Alphonse McMahon of St. Louis, to replace Dr. Henry R. Viets of Boston, who resigned. Dr. Viets served faithfully and energetically for eight years.

The Council reported also on the very successful Miami Clinical Meeting and the Atlantic City Annual Meeting. Both meetings had excellent presentations and large attendance, at both the official presentations and the scientific exhibits. Your reference committee wishes to commend this Council for its excellent work under the leadership of Dr. Henry R. Viets, who has served the Council and the American Medical Association for many years with devotion, bringing inspiration and imagination to the many programs he has supervised. This has been a service to the Association and the doctors but above all an outstanding health service to the people of America. Your reference committee congratulates the Council on the election of Dr. Alphonse McMahon as the new chairman and knows he will bring vision and leadership to the Council.

Report of Bureau of Exhibits: The report of the Bureau of Exhibits showed it to be exceedingly active in preparation for the clinical and annual meetings under the Council on Scientific Assembly. It has developed 47 exhibits for loan which portray various phases of activities in which the various departments of the Association have become interested. Two hundred sixty-seven requests were complied with representing 11,881 exhibit days. The Bureau has exhibited medical exhibits at 15 state medical society meetings and at meetings of 20 scientific organizations allied with medicine. It has participated in health exhibits, and with the Dade County Medical Society of Florida cosponsored a wonderful Health Fair in Miami which attracted 43,000 people in four days. The Bureau has also been actively cooperating with various health museums over the country in the interest of better health education to lay groups.

The Committee on Motion Pictures and Medical Television reports that the Film Library, with 14 new additions, total 563 copies of 123 titles—3,141. Loans were made to different groups. The Committee also reviewed 81 films dealing with medicine, and 73 of these reviews have been published in THE JOURNAL. There has been a growing interest in films and television, and this Committee is keeping abreast of the changing times and the lay and professional demands. The Committee is be congratulated for its constructive contribution.

The Bureau of Exhibits has made an outstanding contribution, and your reference committee feels it should be congratulated on a job well done for the profession and in the interest of better health for the citizens of America.

Supplementary Reports of the Board of Trustees A-W

Supplementary reports of the Board of Trustees were presented to the House by members of the Board as follows: Supplementary report A by Dr. Leonard W. Larson; D by Dr. Thomas P. Murdock; F by Dr. James R. McVay; G by Dr. Julian P. Price; J by Dr. James R. Reuling; K by Dr. Edwin S. Hamilton; and the remainder by Dr. Gunnar Gundersen, Chairman. The reports were referred by the Vice Speaker to reference committees as indicated at the beginning of each report.

A. PROGRESS REPORT OF COMMISSION ON MEDICAL CARE PLANS

Supplementary report A was referred to the Reference Committee on Insurance and Medical Service.

NOTE: The Progress Report of the Commission on Medical Care Plans was printed in THE JOURNAL, Dec. 3, 1955, pages 1370-1379.—ED.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, which was adopted:

Supplementary Report A on Progress Report of Commission on Medical Care Plans: While this is a progress report, your reference committee wishes to direct attention to the meticulous and painstaking manner in which the material has been assembled and reduced to charts which are easily understandable with a text packed full of most useful information. This excellent work is to be most highly commended.

B. SOCIAL SECURITY COVERAGE OF PHYSICIANS

Supplementary report B was referred to the Reference Committee on Legislation and Public Relations.

In accordance with the recommendation made by the House of Delegates at the Atlantic City meeting, the Board of Trustees prepared a statement for the purpose of acquainting the physicians of the country with the reasons why the American Medical Association is opposed to compulsory inclusion of physicians under the Federal Old-Age and Survivors Insurance program. So as to give wide publicity to the statement, it was published in THE JOURNAL of the American Medical Association, Nov. 26, 1955, page 1302.

NOTE: Because of the prior publication of the statement contained in Supplementary report B, it is not reproduced in this abstract but will be included in the official *Proceedings*.—ED.

REPORT ON REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, read the following report, which was adopted after amendment of the substitute resolution offered therein:

Your committee has considered supplementary reports B, M, and U, and Resolutions No. 8, 9, 30, and 35, and submits as a substitute one resolution combining the intent of all:

WHEREAS, The Old-Age and Survivors Insurance section of the Social Security Act has become an important source of retirement and survivors' security for the American people, and Social Security payments represent an important element of personal income in the national economy; and

WHEREAS, Liberalizing amendments to the Social Security Act have been so frequently enacted in election years as to justify the inference that political expediency rather than sound public policy was their motivation; and

WHEREAS, The Social Security Amendments of 1955 (H. R. 7225, 84th Congress), now pending before the Committee on Finance of the United States Senate, are a typical example of an irresponsible political approach to amendment of the Social Security Act, in that this measure was conceived in secret in the Committee on Ways and Means, adopted in brief executive session without public hearings despite the request of many witnesses to be heard, rushed to the floor of the House of Representatives before the report of the Committee on Ways and Means was available, pressured through the House by a maneuver which by-passed the Committee on Rules, permitted no amendments, and allowed only 40 minutes of debate; and

WHEREAS, This measure includes sections which would authorize payment of federal cash disability benefits to selected individuals under the Old-Age and Survivors Insurance section of the Social Security Act as a matter of statutory right and without regard for the need of these individuals for cash assistance, and such cash benefits contingent on continued disability are known to be contrary to sound medical practice in the treatment and rehabilitation of the physically and mentally disabled; and

WHEREAS, The American system of the private practice of medicine, keeping inviolate the physician-patient relationship, has brought to the American people the world's highest standard of medical care, any interference by a third party, government or private, with the physician-patient relationship will destroy the principle on which our successful system of medical care has been built and will lead inevitably to the deterioration of the quality of medical care available to the American people; and

WHEREAS, There has never been an adequate, objective, unbiased study of the nature, cost, and scope of the Old-Age and Survivors Insurance section of the Social Security Act and its economic, social, and political impact on the American people; therefore be it

Resolved, That the American Medical Association reiterate in the strongest possible terms its determination to resist any encroachment on the American system of medical practice which would be detrimental to our patients, the American people; and be it further

Resolved, That the American Medical Association urge and support the creation of a well-qualified commission, governmental, private, or both, to make a thorough, objective, and impartial study of the economic, social, and political impact of Social Security, both medical and otherwise, and that the facts developed by such a study should be the sole basis for objective, nonpolitical improvements to the Social Security Act for the benefit of all of the American people; and be it further

Resolved, That the American Medical Association pledges its wholehearted cooperation in such a study of Social Security in the United States, and will devote its best efforts to procuring and providing full information on the medical aspects of disability, rehabilitation, and medical care of the disabled; and be it further

Resolved, That copies of this resolution be transmitted to the President of the United States, to all members of the Cabinet, to all members of the Congress, and to all constituent state medical associations.

C. STATE JOURNAL ADVERTISING BUREAU

Supplementary report C was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

At its November, 1955, meeting the Advisory Committee to the State Journal Advertising Bureau recommended that the Bureau be separated from the American Medical Association and be given full autonomy. The Board of Trustees agrees with this recommendation and feels that the Advertising Bureau has reached a point where it can and should carry on its business as a separate entity.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Homer M. Izumi, Chairman, Hawaii, presented the following report, which was adopted:

Supplementary Report C on State Journal Advertising Bureau: Your committee concurs in the recommendation of the Board of Trustees and recommends that it be adopted.

D. COUNCIL ON MEDICAL PHYSICS

Supplementary report D was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

Following the Atlantic City meeting in June, 1955, a thorough review and study was made of the report of the Special Committee on Rehabilitation and the recommendation adopted by the House of Delegates, i. e.:

> ". . . that (1) the Council on Physical Medicine and Rehabilitation be renamed the Council on Rehabilitation; (2) that it be reorganized so that all branches of medicine interested in the broad field of rehabilitation shall be represented in the membership of the Council, and (3) that a committee be appointed to carry on activities in the field of apparatus, instruments and devices."

The Committee on Scientific Councils met with representatives of the former Council on Physical Medicine and Rehabilitation and other interested individuals of the several councils of the Association whose work in any way touches on rehabilitation. It was the consensus of all that it would be advisable to establish a Council on Medical Physics, instead of a Council on Rehabilitation. The functions of the proposed Council would be to "carry on activities in the field of apparatus, instruments, and devices." It is believed that rehabilitation problems should be assigned to an interassociation liaison group, with representation from all interested American Medical Association councils and committees dealing with the subject.

The Board of Trustees is in agreement with the recommendations of its Committee on Scientific Councils and submits them, with its approval, to the House of Delegates for action.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Homer M. Izumi, Chairman, Hawaii, read the following report, which was adopted:

Supplementary Report D on Council on Medical Physics: Your committee has carefully considered this report and approves the establishment of such a council. However, while the committee believes the name "Medical Physics" is subject to misinterpretation it was unable to suggest a more appropriate name and therefore recommends adoption of this title.

With regard to the rehabilitation problem, your committee recommends the rewording of the next to the last sentence of the report. The word "intra-association" in place of "inter-association" and the addition of the word "sections" after the word "councils," which would make this sentence read as follows: "It is believed that rehabilitation problems should be assigned to an intra-association liaison group with representation from all interested American Medical Association councils, sections, and committees dealing with the subject."

E. HISTORY OF MEDICINE SECTION

Supplementary report E was referred to the Reference Committee on Sections and Section Work.

Resolution No. 24 requesting a study of the feasibility and the desirability of a Section on the History of Medicine in the Scientific Assembly of the American Medical Association, introduced at the June, 1955, meeting, was referred by the Board of Trustees to the Council on Scientific Assembly. The Council reported that there have been three sessions on this subject in the Section on Miscellaneous Topics at Association meetings and the attendance was small at each one. In 1947 there were 50 persons present and, in 1948, 30 persons. It recommended, therefore, that a Section on the History of Medicine be not established but that time be granted for a Session on the History of Medicine in the Section on Miscellaneous Topics from time to time.

The Board of Trustees adopted the recommendation of the Council on Scientific Assembly and submits it to the House of Delegates for consideration and action.

REPORT OF REFERENCE COMMITTEE ON SECTIONS AND SECTION WORK

Dr. Gilson Colby Engel, Chairman, Pennsylvania, presented the following report, which was adopted:

Supplementary Report E on History of Medicine Section: Your reference committee considered supplementary report of the Board of Trustees E dealing with the History of Medicine Section. This concerned itself with the establishment of a Section on the History of Medicine. Your committee, because of statistics of the past showing poor attendance at such sessions, recommends that a Section on the History of Medicine be not established at this time, but that consideration should be given for a session on the History of Medicine in the Section on Miscellaneous Topics from time to time.

F. RESOLUTION ON MEDICAL PRACTICES

Supplementary report F was referred to the Reference Committee on Insurance and Medical Service.

At its meeting in Atlantic City in June, 1955, the House of Delegates approved in principle Resolution No. 41, calling for the creation of a subcommittee to work on a relative value scale, the adoption of a program of public education on the value of diagnostic and medical work, the encouragement of specialty boards in medicine to reappraise regulations restricting the practice of board diplomates and the discouragement of arbitrary restrictions by hospitals against general practitioners. The resolution further requested the House of Delegates to ask the American Hospital Association to request boards of trustees of hospitals to refrain from demanding that medical staff members submit to an audit of their books for the purpose of detecting fee splitting and that the hospital association be assured that medicine is ready and able to solve satisfactorily its own problems.

The resolution was referred by the Board of Trustees to the Judicial Council, which agreed that the programs suggested in the resolution do not in any way conflict with established ethical policies of the Association and may be properly undertaken by the Board. The resolution was then referred to the Council on Medical Service. The Council submitted the following report, which was accepted by the Board for transmittal to the House of Delegates:

1. Since there are at least three experiments, other than that of the thoracic surgeons, concerned with developing relative value schedules now in process, the Council believes these should be reviewed before any subcommittee "... to work on a relative value scale ..." is created;
2. With reference to ". . . a program of public education . . . on the value of diagnostic and medical work . . . to increase the public's appreciation of non-surgical work . . . ", the Council suggests that all nonsurgical groups be asked for their suggestions and cooperation in carrying out such a public education program;
3. The Council is in full accord with the suggestion relative to a reappraisal of the practice restrictions of the various specialty boards;
4. The Council is also in accord with the recommendation that the American Medical Association should continue to discourage arbitrary restrictions by hospitals against general practitioners; and finally
5. The Council concurs in the statement that organized medicine is ready, willing, and able to solve satisfactorily its own problems, and such assurance should be given to the American Hospital Association or any other group concerning itself with such problems.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, which, after amendment of the substitute resolution by the addition to the last "resolved" of the words, "and promptly to the editor of each state medical journal," and further amendment by the insertion at the beginning of the fifth "resolved" of the phrase, "subject to review by counsel of the Association," was adopted:

Supplementary Report of Board of Trustees F and Resolutions No. 11, 12, 20, and 28: Because each of these resolutions and the report to the Board of Trustees of the Committee on Medical Practices (Truman committee) all dealt with the same general subject, they were discussed as one subject, and the various speakers referred to the several resolutions and to the report of the special committee frequently during the discussion. Forty-four speakers addressed themselves to this problem and while, as stated above, there was some difference of opinion on the part of a small minority, at the end of the discussion there seemed to be unusual agreement on fundamental principles and the objectives to be achieved by the resolutions presented. Consequently, your reference committee will present Supplementary Report F of the Board of Trustees with only one modification and a recommendation that, as amended, it be approved. This modification consists in the deletion of the first numbered paragraph, which reads: "Since there are at least three experiments, other than that of the thoracic surgeons, concerned with developing relative value schedules now in process, the Council (on Medical Service) believes these should be reviewed before any subcommittee '. . . . to work on a relative value scale . . .' is created";

Resolutions No. 11, 12, 20, and 28 all deal with the same subject and each of these resolutions emphasizes some special phase. After careful consideration your committee presents the following substitute resolution:

WHEREAS, The report of the Committee on Medical Practices was presented to this House of Delegates in June, 1955, in which the committee has completed its intensive study of the basic causes leading to certain unethical practices and to unfavorable publicity; and

WHEREAS, The findings and recommendations of this committee deserve intensive study by the physicians of this country and by the American Medical Association, who should consider their rather wide ramifications and the feasibility of their practical application; and

WHEREAS, The House of Delegates of the American Medical Association in 1947 resolved that "It was never intended that staff appointments in hospitals generally, or even in hospitals approved for residencies, should be limited to board certified physicians as is now the policy in some hospitals. Such policies, if practiced extensively, are detrimental to the health of the people and therefore to American medicine. Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients as judged by the professional staff of the hospital and not on certification or special society membership."; now therefore be it

Resolved, That a Continuing Committee on Medical Practice be created in the American Medical Association to conduct a study of the relative value of diagnostic, medical, and surgical services and to report its findings and recommendations to this House in the same manner as is now followed by other committees and councils of the Association; and be it further

Resolved, That this committee shall consist of five members of the House appointed by the Speaker, three of whom shall be general practitioners; the terms of the members of this committee shall ultimately be three years, arranged at the discretion of the Speaker in his original and subsequent appointments so that these terms shall be staggered; and be it further

Resolved, That this committee be directed to utilize all possible means to stimulate the formation of a department of general practice in each medical school; and be it further

Resolved, That the American Medical Association approve of the medical school teaching programs which afford the medical student opportunity for experience in the general practice of medicine; and be it further

Resolved, That, subject to review by counsel of the American Medical Association, the representatives of the Association on the Joint Commission on Accreditation of Hospitals be instructed to stimulate action by that body leading to the warning, provisional accreditation, or removal of accreditation of community or general hospitals, which exclude or arbitrarily restrict hospital privileges for generalists as a class regardless of their individual professional competence, after appeal to the Commission by the county medical society concerned; and be it further

Resolved, That this committee cooperate in every way and assist the Public Relations Department of the American Medical Association to present a program of public education designed to bring about a better understanding of all fields of medical practices; and be it further

Resolved, That this committee use its full influence to discourage any arbitrary restrictions by hospitals against general practitioners as a group or as individuals; and be it further

Resolved, That a copy of this resolution be sent to the American College of Surgeons, the American College of Physicians, the American Academy of Pediatrics, the American Academy of Obstetrics and Gynecology, the American Academy of General Practice, the American Hospital Association, the Catholic Hospital Association, the American Protestant Hospital Association, the chief of staff of every hospital in the United States and its territories, the deans of each medical school, and promptly to the editor of each state medical journal.

G. IMMUNE GLOBULIN (HUMAN)

Supplementary report G was referred to the Reference Committee on Hygiene, Public Health, and Industrial Health.

At its meeting in Atlantic City in June, 1955, the House of Delegates approved Resolution No. 42, which on the basis of disapproval by the Council on Pharmacy and Chemistry as well as producers of immune globulin (Human) advocated changing the name of this product from "Poliomyelitis Immune Globulin (Human)" to its earlier designation of "Immune Globulin (Human)." The Board of Trustees referred the resolution to the Council on Pharmacy and Chemistry for its official attitude toward the designations mentioned therein and received the following memorandum:

The designation "Immune Serum Globulin (Human)", not "Immune Globulin (Human)" is the correct U. S. P. terminology for the nonstandardized measles prophylactic which is commonly referred to in the literature as gamma globulin. On the other hand, gamma globulin which is standardized for polio antibody content has been given the more specific designation "Poliomyelitis Immune Globulin (Human)" by the National Institutes of Health of the Public Health Service. The latter is recognized for use in the passive immunization of poliomyelitis. Thus although both preparations are gamma globulin and have some features in common, different names appear necessary to distinguish the polio-standardized from the nonstandardized product. If there was a suitable laboratory method for standardizing gamma globulin for measles antibody, such a preparation could then be specifically designated as "Measles Immune Globulin (Human)" instead of "Immune Serum Globulin (Human)". The chief purpose of affixing a specific designation for the polio material apparently is to avoid the unwarranted use of nonstandardized gamma globulin for passive immunization against poliomyelitis. In summary, the Council has agreed with the National Institutes of Health that the distinctive designation "Poliomyelitis Immune Globulin (Human)" should be applied to a product which is promoted for passive immunization against poliomyelitis and standardized for polio antibody content. Accordingly, the Council has recognized this terminology as being appropriate.

The Board of Trustees wishes to refer this memorandum from the Council on Pharmacy and Chemistry to the House of Delegates for appropriate action with respect to the nomenclature of the product in question.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, read the following report, which was adopted:

Supplementary Report G on Immune Globulin (Human): Your committee, after hearing many witnesses, approved this report, but recommends, however, a change in the nomenclature from "Poliomyelitis Immune Globulin (Human)" to "Poliomyelitis Standardized Immune Globulin (Human)" to differentiate nonstandardized globulin which is used in the treatment of measles.

H. Commission on Chronic Illness Newsletter

Supplementary report H was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

In June, 1956, the Commission on Chronic Illness will have completed the task assigned to it. The American Medical Association, in an effort to carry on the excellent work of the commission in the field of chronic illness, offered to continue the Newsletter distributed by that agency, and the offer was accepted by the Commission. The Newsletter will continue to follow the pattern set by the commission and will be under the auspices of the Council on Medical Service. The Council will be assisted by an editorial committee. It is hoped that those who receive the Newsletter will find it as interesting and useful as in the past.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Homer M. Izumi, Chairman, Hawaii, submitted the following report, which was adopted:

Supplementary Report H on Commission on Chronic Illness Newsletter is purely informative and your reference committee recommends its acceptance.

I. Improvement in Patient Care

Supplementary report I was referred to the Reference Committee on Hygiene, Public Health, and Industrial Health.

At a meeting of the Health Resources Advisory Committee, the following resolution was adopted and referred to the Board of Trustees for consideration and action:

> Whereas, *The medical profession recognizes the tremendous advances* which have been made in the improvement of patient care through new scientific knowledge and skills, particularly in medicine; and
>
> Whereas, These advances have increased the complexity of problems regarding the utilization of skilled personnel and hospital services; and
>
> Whereas, These advantages should be utilized for the improvement of the care of patients; therefore be it
>
> *Resolved*, That the physicians of the United States accept the responsibility of doing everything possible to improve patient care, cooperate with all groups involved in improvement of patient care, and accept the responsibility for providing the necessary leadership for establishing Joint *Committees for the Improvement of the Care of the Patient at state and* local levels.

The resolution was approved by the Board of Trustees for referral to the House of Delegates for its action.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, read the following report, which was adopted:

Supplementary Report I on Improvement in Patient Care: Supplementary report I of the Board of Trustees originated at a meeting of the Health Resources Advisory Committee of the Office of Defense Mobilization. Your committee recommends that the resolution contained in this report be referred back to the Board of Trustees for definition and clarification of what groups will constitute the joint committee, and recommends consultation with representatives of the College of American Pathologists.

J. Physician Selection in Workmen's Compensation

Supplementary report J was referred to the Reference Committee on Hygiene, Public Health, and Industrial Health.

The following recommendation with respect to physician selection in workmen's compensation was made by the Council on Industrial Health and received the approval of the Board of Trustees:

> ". . . *that the appropriate official* medical organizations in each workmen's compensation jurisdiction examine and, where necessary, seek adoption of statutory provisions to the end that all patients subject to workmen's compensation laws have the right to accept physicians' services provided by employers or to select another attending physician from a register of all other physicians in the community willing and able to perform the essential services."

The Council's recommendation is hereby transmitted to the House of Delegates for appropriate action.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

The report of the reference committee on supplementary report J will be found in the fifth paragraph of its report on the report of the Council on Industrial Health on page 1649 of this issue of The Journal.

K. World Medical Association Meeting

Supplementary report K was referred to the Reference Committee on Reports of Boards of Trustees and Secretary.

The Ninth Annual General Assembly of the World Medical Association was held in Vienna during the latter part of September of this year. Vienna is an impressive city for a medical meeting and those in attendance will long remember the hospitality and graciousness of the people, as well as the beauty of the city. Many topics were discussed, the one creating the most interest being social security. Although the words "social security" may be defined and applied differently in various parts of the world, there is never any difference of opinion at the assemblies about what the delegates have in mind. They are ever mindful of the need for providing the best possible medical care to their patients. All are united, however, in opposition to unnecessary interference by a government in medical care plans, and they resent, apparently without exception, any attempts on the part of government officials to interject themselves arbitrarily between the doctor and his patient. Considerable discussion was devoted to the International Social Security Association, a body that is allied to the International Labour Office and is dedicated to the extension of social security coverage. This body has adopted 15 principles that, if enacted in any country, would completely subject the doctor and his patient to government control. The officers of the World Medical Association have led an unceasing fight against such control. Details of the deliberations of the council and of the delegates at the assembly will be published in the *World Medical Journal.*

The financial affairs of the World Medical Association are a matter of concern. Much help has been provided by the physicians of America and the drug industry, as well as others, but it is hoped that more physicians in America will join the United States Supporting Committee. Dues are $10 and will permit any doctor to be prepared for participation in the 10th General Assembly, which will be held in Cuba in October, 1956. It is also a small sum to pay for the returns that stem from the work of the association. The advancement of medical knowledge and the continuation of freedom for medical practice are just two of the benefits that the World Medical Association is striving to provide.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Homer M. Izumi, Chairman, Hawaii, read the following report, which was adopted:

Supplementary Report K on World Medical Association: Your committee whole-heartedly supports the sentiment of the Board of Trustees in urging that many more American physicians join the United States Committee and give their support to this worthy cause.

L. Report of Committee to Recommend Guides for Grievance or Mediation Committees

Supplementary report L was referred to the Reference Committee on Miscellaneous Business.

The Committee to Recommend Guides for Grievance or Mediation Committees, which was appointed in December, 1954, composed of Drs. John P. Culpepper Jr., Chairman, Frank D. Costenbader, Keith Frankhauser, Cleon A. Nafe, and George A. Unfug, has undertaken an exhaustive survey and study required by action of the House of Delegates on Resolutions No. 17 and No. 26 at the Miami meeting in December, 1954.

The committee reviewed all available data and developed new information through staff field work for the purpose of preparing guides rather than standards for the organization and operation of grievance or mediation committees, leaving the details as to the organization and operation of component county and district society committees to the constituent state and territorial associations. On the basis of its findings, the committee submitted recommendations for Guides for Grievance Committees of Constituent Associations, with full recognition that some variations may be made by each state association to fit its own requirements. The committee believes that these guides are equally applicable to the organization and operation of component society grievance committees.

The complete report of the committee was carefully studied by the Board of Trustees and was approved for transmission to the House of Delegates with the recommendation that it be adopted. The Board also recommends that, if adopted, the guides be published in booklet form for distribution to the constituent associations and that, in accordance with its wishes, the committee be discharged following publication of the recommended brochure.

GUIDES FOR THE ORGANIZATION OF GRIEVANCE COMMITTEES FOR CONSTITUENT ASSOCIATIONS

Background: In December, 1949, the House of Delegates adopted a resolution introduced by Dr. J. B. Lukins of Kentucky, which stated in part: "That this House of Delegates hereby commends those constituent state associations that have already established grievance committees to hear any complaints of the public and urges that all constituent associations adopt comparable programs . . ."

Since that time, the Council on Medical Service has continually studied the development of this movement and has issued periodic reports designed to keep the profession informed of the progress of medical associations in carrying out the original intent of the Lukins resolution. In this work the Council prepared and published three separate studies, Medical Society Grievance Committees—Their Development and Function, December, 1950; Medical Society Grievance Committees—a Progress Report, January, 1952; and Medical Society Grievance Committees—Component Societies, 1953. According to studies then available, all of the 48 state medical associations, the Medical Society of the District of Columbia, and the Hawaii Medical Association had provided in some formal manner for the hearing of complaints from the public. The latest study of county societies, 1955, shows that almost 700 grievance committees are in operation.

These studies demonstrated such wide variation in the methods of organization and operation of these committees as to require clarification and definition to eliminate confusion on the part of the medical profession and the public as to the purposes and objectives of such committees.

In addition, the effectiveness of such committees remained unmeasured, and two resolutions were introduced before the House of Delegates in December, 1954, which read in part as follows:

Resolution No. 17, introduced by Dr. William H. Halley, Colorado:

> *Resolved,* That the Board of Trustees is requested to appoint a nationally representative special committee, to consist of representatives of successful mediation or grievance committees howsoever they may be entitled in the various states, to study this problem and recommend through the Board of Trustees to the House of Delegates such standards as may be promulgated by the American Medical Association as a guide to the organization and functioning of such bodies in the constituent associations and component societies.

Resolution No. 26, introduced by Dr. J. P. Culpepper Jr., Mississippi:

> *Resolved,* That the Board of Trustees appoint a committee of not less than five nor more than 15 representatives from constituent societies in which mediation committees have been effective and useful; this committee shall study and report to the Board of Trustees recommended standards for operation of this service.

The Reference Committee on Miscellaneous Business presented the following report on these resolutions, which was adopted:

> Resolution No. 17 on Grievance Committees, and Resolution No. 26 on Establishing Recommended Standards for Mediation Committees: Your reference committee endorses the principles embodied in Resolutions No. 17 and 26 and recommends to the Board of Trustees that it appoint a committee to study and report to the Board of Trustees recommended standards for operation of this service.

In compliance with this action of the House of Delegates, the Board of Trustees appointed a Committee to Recommend Standards for Grievance or Mediation Committees composed of Drs. J. P. Culpepper Jr., Chairman, Mississippi; George A. Unfug, Colorado; Frank Costenbader, District of Columbia; Keith Frankhauser, Illinois; and Cleon A. Nafe, Indiana. Messrs. Rowland B. Kennedy, executive secretary of the Mississippi State Medical Association; Harvey T. Sethman, executive secretary of the Colorado State Medical Society; and John E. Farrell, Sc.D., executive secretary of the Rhode Island Medical Society, were appointed special assistants to the committee.

After reviewing all available material, the committee felt that its primary concern should be with constituent associations and that it should seek to prepare guides rather than standards for the organization and operation of such committees, leaving the details as to the organization and operation of component county and district society committees to the constituent state and territorial associations. With these two objectives in mind the committee reviewed all available data, developed new information through staff field work, and met in Chicago on three occasions. With the assistance of the staff a detailed survey form was developed and used in visits to 21 constituent associations. In each state survey interviews were conducted with state committee members, officers, employed executives, and others. The information obtained was summarized and reviewed at Committee meetings. The staff and committee chairman met on several additional occasions to prepare preliminary reports to the committee itself.

Early in this study the committee appreciated the fact that its membership had been selected to represent geographical and urban-rural differences in thought and a variety of opinions on many aspects of the organization and operation of grievance committees. Despite this, unanimity of opinion on most matters emerged before the third committee meeting was completed. The following findings and recommendations, therefore, represent the combined efforts and thinking of all committee members. These recommendations for Guides for Grievance Committees of Constituent Associations are submitted with full recognition that some variations may be made by each state association to fit its own requirements. These guides are equally applicable to the organization and operation of component society grievance committees.

Purposes of Committees: The purposes of grievance committees are to prevent or resolve misunderstandings, to clarify and adjust differences between physician and patient, and to assist in maintaining the high levels of professional deportment already established by the Principles of Medical Ethics. When grievance committees are properly organized and operated, they can accomplish these objectives. Progressively improving medical public relations will result.

To serve these purposes, grievance committees should be impowered by constituent associations with authority to receive complaints, to investigate, mediate, arbitrate, and where necessary refer them to appropriate bodies for adjudication. Inherent in these purposes is the necessity for consistency, uniformity, and absolute impartiality.

Committee Titles: With a full realization as to both the variety of titles presently used and the reasons underlying the selection of some of these titles, Grievance Committee is unquestionably the most realistic title and the one best understood by the profession and the public. The term "grievance committee" has existed for many years through its uniform use by the American Bar Association and state bar associations. At present 20 state associations use this title; 2 use Board of Supervisors; and 2 use Mediation Committee. Some others used by individual states are Committee on Grievances, Grievance Board, Committee on Patient-Physician Relations, Committee on Medical Defense and Grievance, Judicial Council, Committee on Ethics and Discipline, Council on Professional Ethics, Committee on Professional Relations Public Liaison Committee, Judicial and Professional Relations Committee, Judicial and Advisory Committee, and Welfare Committee.

Any unfortunate disguising of a grievance committee's true purpose by the use of inappropriate titles or by ascribing to it a multiplicity of functions negates realization of valuable benefits to the profession and the public alike. The grievance committee is of such compelling importance in modern medical organization that a special committee, uniformly designated to disclose unmistakably its true function, should be created and maintained by every constituent association for this purpose and this purpose only.

Authorization of Committee: To insure permanence and appropriate authority for a grievance committee, provision should be made in the constitution or bylaws of the constituent association for the creation, maintenance, and authority of the committee. These provisions should clearly state the purpose, extent of authority, and duties of the committee, fix its membership, and determine the tenure of office of each committeeman. A review of current provisions in constitutions and bylaws of the constituent associations discloses a generally inadequate approach to these ends.

Committee Membership: It is recognized that there are extreme variations of both geography and population among the states and territories served by the constituent associations and that these variations explain in part the present range in membership of committees (from 3 to 27 members). Nevertheless, it would seem that successful operation of these committees requires a broad representation not provided normally by less than seven members. In addition, continuity of service can be best attained by a committee serving overlapping terms so that at least half the committee membership is always experienced in its work. It would seem, therefore, that such committees might best be organized with a membership of not less than 7 nor more than 15 members serving overlapping terms of not less than two nor more than four years.

Members of grievance committees hold a continuing and unique responsibility. Therefore, members should not simultaneously serve on any disciplinary or appeal body of the association, since a conflict of interests could defeat successful operation and function of these bodies.

In selecting members for a grievance committee, special consideration must be given to willingness to perform delicate and sometimes odious tasks as a member of an impartial team. In this selection the following points should be considered: Experience in the affairs of medical organization, judicial temperament, varieties in geographical location (urban, rural), type of practice, and age. Any arbitrary method of selecting members of a grievance committee based on only one of the above characteristics or based solely on previous positions held in the medical association is undesirable.

Committee Authority: Certain authorities are essential to the successful operation of a grievance committee. Among these are authority to compel the response, either in writing or by personal appearance, of any member of the medical organization, authority to initiate investigations on the committee's own motion, and authority to file charges in the name of the committee before an appropriate judicial body of the medical organization. To be effective these authorities must be included in either the constitution or the bylaws of the constituent association.

At the same time, the authorities granted a grievance committee must be subject to definite limitations. Discipline is not a proper function of a grievance committee under any circumstance. Where a grievance committee finds that disciplinary measures are indicated, it should so recommend to the appropriate judicial body of the association.

Operating Procedures: It is desirable that grievances should be heard and adjudicated at the local level. However, examination proves that there are instances when constituent associations find it necessary to have their state grievance committees investigate and adjudicate complaints originating in component societies that are too small, unwilling, or otherwise unable to undertake this function. Each constituent association should measure the capacity of its component societies to maintain grievance committees. Such capacity would include consideration of the size of the components, geographical distribution of their members, and the willingness of these members to undertake this task.

In many states complaints are first received in the office of the constituent association. Some constituent medical associations will find it desirable to refer the great majority of complaints to the component societies with jurisdiction. Where a constituent association refers such cases to a component society or delegates this entire function to a component society, the state grievance committee should become an appeal body for that case or that society.

In either of the above methods, the handling of all complaints should include prompt acknowledgment, immediate investigation, impartial hearings and decisions, and prompt announcement of the decisions to those concerned.

Current practices of the constituent associations regarding the receipt of complaints are far from uniform. They vary from a requirement for sworn complaints to acceptance of the most casual of verbal utterances. They vary further since some associations place limitations upon the sources of complaints. It is recommended that there be no limitation upon sources of complaints and that grievance committees be empowered and willing to consider a complaint from any sincere source, public or private, professional or lay. It is distinctly preferable for complaints to be submitted in writing. Where for any sound reason this is impracticable, a verbal complaint should be received if supported by agreement to present it in person before the committee.

In addition to investigation of submitted complaints, the grievance committee should be empowered and willing to initiate investigations on its own motion whenever matters justifying grievance committee action come to its attention.

Privileges of Complainant and Complainee: Impartial and expeditious adjudication of grievances contemplates the guarantee of specific privileges equally to the complainant and the complainee. Among these privileges are the following opportunities: (1) to appear in person before the committee; (2) to present witnesses or evidence in substantiation of the complaint or the reply; (3) to have prompt notification of the decision of the committee; and (4) to appeal the decision to the appropriate superior body.

It should be understood that the physician summoned before a grievance committee is not on trial.

In all these proceedings it should be constantly borne in mind that, as has been indicated elsewhere in this report, a grievance committee's primary functions are to investigate, mediate, arbitrate, and, if necessary, to recommend disciplinary action, but the grievance committee is never to act as a trial body or to effect discipline.

Meetings, Records, and Reports: Each constituent association should determine for itself the frequency of meetings to be held by its grievance committee. Similarly, each association should determine who, if anyone, may attend meetings of its grievance committee in addition to the members of that committee and the complainant or complainee then being heard. Methods of procedure, including these and other points which will necessarily vary from state to state, should be formally established.

In each matter considered the grievance committee should preserve a record including the names of the complainant and complainee, the general nature of the complaint, and the committee's decision. The routine preservation of additional files or records normally should not be necessary. However, if there should be doubt as to the advisability of retaining records in any specific case, the advice of legal counsel should be sought. These records should not go beyond the membership of the committee except upon appeal or in those instances where the committee finds it necessary to refer the matter to a higher body. When referring a case to a judicial body of the association, however, all records of the grievance committee pertaining to that particular case should be transmitted to the judicial body.

Reports without identification of any individuals should be made regularly to the governing body of the constituent association so that it will know the nature, extent, and disposition of complaints coming before the committee.

Publicity: The establishment of grievance committees is a service of medical organization to the public, but this service cannot succeed unless the public knows of its existence and understands how to use it. Therefore, the availability and the method of operation of these committees should be continuously publicized through legitimate channels of lay communication. Concurrently, the profession must be kept informed of the committee's work by utilizing all professional mediums, such as medical journals, newsletters, secretary's letters, and president's pages.

Conclusion: The purpose of the above guides is to promote general uniformity of organization and function of grievance committees and better understanding of their purposes without interfering with the inherent autonomy of constituent medical associations. Constituent associations are therefore urged to implement these guides without delay.

It is recognized that many variables, including the laws of the several states, may influence the operations or the procedures followed by state grievance committees organized within the framework of these guides. Constituent associations should have no reluctance in seeking the advice of legal counsel whenever questions arise concerning the application of state laws to these guides. They should also feel free to call upon the Council on Medical Service and the Public Relations Department of the American Medical Association. The American Medical Association possesses a wealth of information concerning the experience of state associations and county societies as precedents for these proposals.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, presented the following report, which was adopted:

Supplementary Report L on Report of Committee to Recommend Guides for Grievance or Mediation Committees: Your reference committee desires especially to commend this Committee on Grievance Committees consisting of Drs. John P. Culpepper Jr., Chairman, Frank D. Costenbader, Keith Frankhauser, Cleon A. Nafe, and George A. Unfug and their able assistants Messrs. Rowland B. Kennedy, Harvey T. Sethman, and John E. Farrell for their superb approach to this problem. Your reference committee is keenly aware of the extensive amount of work done by this Committee and desires especially to commend the manner in which this study was undertaken, which may well serve as a model for similar committees. The committee conducted a series of conferences at the "grass-roots level," which aided materially in clarifying many difficult problems. The committee also made extensive use of the services of the Council on Medical Service, of the Law Department, and of other qualified personnel at Association headquarters.

Your reference committee desires to support the recommendation that a brochure be published promptly which will outline the recommendations regarding the activities of grievance committees and that this brochure be given wide distribution. It recommends also that there be an appendix to this brochure in which additional, practical suggestions shall be included.

Your committee desires also to support the contention that there should be no equivocation concerning the naming of such committees and recommends that a uniform policy be adopted in which they are called frankly "Grievance Committees."

Finally, your reference committee recommends that because of the many variables, including the laws of the several states, which may influence the operations or procedures followed by state grievance committees, legal counsel shall be sought at the local level within the states. Your committee recommends the adoption of this supplementary report of the Board of Trustees.

M. SOCIAL SECURITY AMENDMENTS OF 1955

Supplementary report M was referred to the Reference Committee on Legislation and Public Relations.

This informational report by the Board of Trustees to the House of Delegates concerns a legislative problem which the Board considers to be the most serious faced by the medical profession in many years. The problem became acute last summer after the Annual Meeting in Atlantic City. It involves a bill introduced too late in the first session of the 84th Congress for the House of Delegates to act on it last June. The bill in question is H. R. 7225, known as the Social Security Amendments of 1955. This legislation first was rushed through the House Ways and Means Committee, meeting in brief executive session, without public hearings. Then it was passed by the House of Representatives on July 18 by a roll call vote of 372 to 31 under a procedure suspending the rules, barring amendments, limiting debate to 40 minutes and requiring a two-thirds vote for approval. This precipitate action was taken despite the protests of numerous Congressmen who demanded open hearings and careful consideration of the bill. Fortunately, the Senate Finance Committee refused to be stampeded into hasty action on a bill of such major importance. The Senate Finance Committee, after noting the many serious questions raised before the House Committee by Mrs. Hobby, then Secretary of the Department of Health, Education, and Welfare, and in response to appeals from many national organizations including the American Medical Association, decided to postpone action until the second session of the 84th Congress, at which time extensive public hearings will be held.

H. R. 7225 would, among other things, lower the Social Security retirement age for women from 65 to 62; expand compulsory Social Security coverage to all self-employed professional groups except physicians, and raise Social Security taxes over and above the increases already scheduled for the next twenty years. These provisions in themselves pose a variety of questions which call for careful study of their ultimate effects on the scope, philosophy, and financial stability of our Social Security system.

From the standpoint of the medical profession, however, the most controversial parts of the bill are the sections which would extend OASI survivor's benefits for permanently and totally disabled children beyond the age of 18 and make permanently and totally disabled persons eligible to receive their Social Security retirement benefits at age 50 instead of 65. These sections are of particular concern because they would directly affect physicians and the practice of medicine. Under the provisions of this bill, physicians—both in determining total and permanent disability and in providing the rehabilitation services required by the legislation before the cash benefit is paid—presumably would be under federal regulation and would be paid for their medical services, at least in part, out of federal funds. By providing a disability benefit as a right through the OASI system this legislation would subject physicians to government regulations in making disability determinations and rendering rehabilitation services. Furthermore, constant pressures from government, administrators, and patients seeking disability certifications would cause increasing harrassment of the medical profession.

This bill clearly is another step in the extension of government control over the medical profession. More important, it raises grave questions relating to the welfare of our patients. Its threat to the profession is only significant if it conflicts with our ability to discharge our obligations to those we serve. It would classify and certify as hopeless many of those to whom adjustment to a new way of life offers the only hope of recovery and rehabilitation. In the guise of aiding those disabled, it would hamper their return to useful life. The emphasis on the cash benefit would hinder rather than promote rehabilitation of the disabled. Thus, the most serious question raised by H. R. 7225 concerns this long range effect on the future of medical practice. Your Board of Trustees strongly suspects and fears that this proposal, if enacted, would prove to be just another piece in the pattern of social planning leading inevitably to permanent disability benefits at any age, cash benefits for the temporarily disabled, direct federal payments for hospital and medical costs, and then, ultimately, a full-fledged system of tax-paid medical care.

When this legislative problem arose suddenly last summer, the Board of Trustees faced a difficult decision in determining the Association's approach toward H. R. 7225. The Board was fully aware of the questions and dangers just outlined in this report, for those same points have been the basis of previous policy positions taken by the House of Delegates with respect to federal programs for permanent and total disability benefits. Five years ago, following the introduction of H. R. 6000 in 1949, the House of Delegates adopted a policy opposing such a program, and the Association presented its views in Congressional hearings. Last year the Association vigorously opposed the "waiver of premium" section of the 1954 Social Security Amendments, arguing that it would be the opening wedge for a federal system of cash benefits to the permanently and totally disabled. Now, only one year later, our warning has been confirmed, and the bill establishing such a system has already passed the United States House of Representatives.

While fully cognizant of past actions by the House of Delegates and the reasons for them, the Board of Trustees nevertheless had to consider a variety of other factors, including possible differences of viewpoint inside the medical profession, the climate of public opinion, the political situation, and the public relations aspects of the problem. In the opinion of the Board, the American Medical Association can reasonably support the following program:

1. The social security issue, once and for all, should be taken out of politics. It is much too complex a problem with too many serious implications for the future of this country to continue to be considered on the basis of political expediency every two years at election time.

2. There should be an objective, thorough study of social security in all its present and future aspects, medical and otherwise. The American Medical Association will do everything in its power to promote the idea of such a study and to cooperate by conducting more extensive research on disability, rehabilitation, and medical care.

3. The facts developed by such a study should be used as the basis for a sound national decision on this vital issue. Only by getting a clear picture of ultimate liabilities and costs—economic, social, and political—can the American people make an intelligent decision on further expansion of the Social Security system.

In addition to that over-all policy approach, the Board also decided that the Association should conduct an educational program within the medical profession to acquaint physicians with the facts, policies, and new developments relative to this whole issue.

The foregoing decisions made by the Board last summer were fully supported by public relations counsel engaged to advise the Association, not only on this particular legislative issue but on all phases of its public relations program.

Fortunately, a growing number of organizations and individuals are becoming concerned over the continuous politically inspired expansion of the Social Security system. Like the American Medical Association, they see that the system now has reached the point where any further changes may have a profound influence on the nation's economic, social, and political future. They agree that the time has come to ask what social security should accomplish and where it should stop. Many such groups and individuals, sufficiently aroused nationwide, may bring about the sober study needed to promote a stable and sound system.

This House should realize that notwithstanding all of the efforts we and many others have put forth, should the Administration decide to support this proposal, our task will become infinitely greater.

In line with our policy to carry on an educational program within the profession, on Dec. 5 a personal letter from Dr. Elmer Hess, President of the American Medical Association, is being sent to every member of the Association. A pamphlet entitled a "Clinical Analysis of H. R. 7225" dealing with the Social Security Amendments of 1955 will accompany Dr. Hess' letter.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

The report of the reference committee on supplementary report M will be found following supplementary report B on page 1650 of this issue of THE JOURNAL.

N. PROFESSIONAL LIABILITY

Supplementary report N was referred to the Reference Committee on Insurance and Medical Service.

Both the Council on Medical Service and the Law Department have submitted at this meeting full reports of their studies of professional liability insurance and claims prevention programs. These are submitted by the Board to the House of Delegates as status reports on what has been accomplished to date and what is expected to be accomplished in the future. In the report of the Law Department three exhibits are mentioned which are not included because of their length, but their content is clearly explained in the text.

REPORT FROM COUNCIL ON MEDICAL SERVICE

As the Board of Trustees indicated to the House during the Atlantic City session, the Council on Medical Service recommended in its June 3, 1955, progress report "that the Board make a comprehensive report to the House of Delegates at the 1955 Clinical Session." In keeping with that recommendation and to assist the Board if it concurs, the Council submits this report which summarizes its three previous reports and adds new data compiled since June. The Council understands that a separate report is being made by the Law Department with respect to its surveys in compiling current data with respect to claim prevention and claim service programs of constituent associations as well as other activities.

Specialized Insurance and Limited Market: Although over 250 insurance companies are legally qualified to write professional liability insurance in those areas in which they are licensed, relatively few of them express any active interest in doing so. Some of them prefer to write this business only on an accommodation basis for those physicians who carry other lines of insurance with them. Due to the highly specialized nature of this insurance, many companies may not feel they have adequate claim service facilities in certain areas to justify their assumption of risks in those areas. The ready availability of adequate claim service facilities is deemed necessary to successful underwriting, since claim servicing may have a substantial influence on the ultimate course and final result in any potential claim or suit. In one survey, only about 25 companies indicated they were writing any substantial volume of professional liability insurance. More recently it would appear that the bulk of the exposure countrywide is carried by a considerably lesser number of insurers.

It is the Council's understanding that the majority of this business throughout the country is written on an individual (nongroup) basis. Each applicant is considered on the basis of individual merit. In some jurisdictions constituent associations and component societies have established programs whereby their members may participate in securing this coverage on a group basis. Also, some national medical organizations have made special group arrangements in which their members may participate. Other national organizations are considering the advisability as well as the possibility of establishing special group programs. In at least one instance an attempt to write a special contract for members of a national medical group has been terminated. That effort was discontinued in an orderly manner rather than an outright cancellation of existing contracts. In another case, the members of a medical organization national in scope may participate in a group plan offered by an alien insurer. Some observers are under the impression that such a program may possibly provide less comprehensive protection than is traditional under programs underwritten by domestic companies.

Unique Features: To facilitate an understanding of the time interval between the time a liability policy is issued and the time the experience can be evaluated, three cases are offered. In 1953 a man brought suit for injuries he alleged he received at birth in 1930. He claims he was physically impaired to the extent he could not earn a living and demanded damages in the amount of $175,000. During 1953, an insurance company completed payment on a claim based on medical treatment rendered in 1919. At the end of 1953 another insurance company was financing legal defense for claims originating as far back as 1918, although the company has not underwritten any physician liability risks since 1940. Even though these examples may be somewhat unusual, they do indicate features of professional liability insurance that are perhaps without parallel in any other type of risk underwriting. While other cases could be cited, those just mentioned seem to substantiate the observation of the Defense Board of the Medical Society of the State of New York to the effect ". . . there is no form of insurance more difficult to write or to rate correctly than malpractice . . ."

To illustrate further the time interval, table 1 has been prepared showing the elapsed time after "year of issue" before the cumulative percentage of claim cost for that year is realized. The left hand column indicates the year of issue. The next column shows the percentage of total assumed dollar amount of claims paid during the same policy year; while the ensuing columns show the cumulative percentage of assumed total cost realized at the end of the indicated subsequent years. The terms "total assumed dollar amount" and "assumed total cost" are used because all of the indicated percentages will be invalidated if further claim payments have to be made subsequent to 11 years after date of issue. In other words, these percentages are computed on the assumption that no further claims will have to be paid with respect to contracts effected during the indicated "Policy Issue Year."

The experience reflected above was developed after reviewing the data of one insurance company which has had considerable experience in this field on an extensive geographical basis.

TABLE 1.—*Percentage of Assumed Total Claims Paid During and at End of Each Subsequent Year*

Policy Issue Year	Current	Subsequent Year										
		1	2	3	4	5	6	7	8	9	10	11 (Assumed)
1920	1.7%	13.1%	41.4%	64.1%	76.8%	86.6%	91.0%	91.0%	91.0%	98.6%	98.6%	100.00%
1930	1.7	14.6	33.8	48.8	68.9	86.5	96.5	97.5	98.7	98.8	99.1	100.00
1940	5.8	29.9	63.7	75.1	83.4	85.2	91.7	96.3	97.6	99.2	99.2	100.00

While the above table relates to percentages of assumed total dollar amounts, a somewhat similar indication of the time interval problem is disclosed by the following table.

Table 2 shows the number of years after policy issue year before claims or suits are reported.

TABLE 2.—*Time Interval After Policy Issue Before Suits or Claims Are Reported*

Years After Issue	No. of Suits and Claims Reported	Percentage of Total	Accumulated Percentage
1	910	21.44	21.44
2	1,922	45.28	66.72
3	922	21.72	88.44
4	328	7.73	96.17
5	70	1.65	97.82
6	32	0.75	98.57
7	35	0.82	99.39
8	9	0.22	99.61
9	8	0.19	99.80
10	3	0.07	99.87
11	3	0.07	99.84
12	0	.....	.....
13	0	.....	.....
14	0	.....	.....
15	1	0.03	99.97
16	1	0.03	100.00

In reviewing the above, it should be remembered that the table shows only the time elapsed before claims or suits are reported. It does not reflect the additional time which may be required to settle the claims or suits. Information in table 2 was compiled by the Malpractice Insurance and Defensè Board of the Medical Society of the State of New York. It represented a review of more than 170,000 policies issued over a 16 year period.

Losses in Excess of Basic Limits: In its June report to the House of Delegates, the Board summarized the Council's initial survey of the extent to which insurance companies have been called upon to pay losses in excess of basic limits (usually $5,000 per claim) during recent years. That tabulation of such awards subsequent to 1950 indicated individual claims or awards ranging from slightly less than $6,000 up to in excess of $67,000. The total then reported amounted to more than $3,407,000. Data received since that time does not alter the range of losses significantly; but the total is now in excess of $4,500,000. The June report to the House indicated that the figures pertained to 27 states and involved some 254 separate claims or awards and, on a per claim basis, amounted to an average of over $13,000. More recent information applies to 35 states involving 347 separate claims or awards with the average amount per claim remaining in excess of $13,000.

Additional Premium Charges for Partnerships: During the 1953 Annual Meeting Dr. Wendell C. Stover, Indiana, introduced the following resolution, which was adopted but has not as yet been reported on to the House:

> *Resolved*, That the Indiana State Medical Association recommends and suggests that this method of ascertaining premium rates for insurance on medical partnerships be brought to the attention of the American Medical Association House of Delegates, and that the delegates from Indiana to the House of Delegates be, and hereby are, directed to present this resolution to the next meeting of the House of Delegates of the American Medical Association; and urge that the Association instruct its committee studying malpractice insurance to take appropriate action to eliminate this element of discrimination in medical malpractice insurance policies.

With respect to the above resolution, the printed report of the Council on Medical Service for the 1953 Clinical Meeting contained the following:

> The resolution concerning the practice of charging extra premiums for partnerships has been included in the scope of the studies. At such time as the Council is in a position to make a more definitive report to the Board it will include this aspect in order to minimize the number of reports addressed to the House concerning the same general subject.

The Indiana resolution alleges a discriminatory practice with respect to those companies that make extra premium charges for liability insurance when physicians practice on a partnership basis. The Council is advised that the extra charge, where made, with respect to partnerships is done on the basis of the added legal liability. From a legal as well as financial standpoint, any member of a partnership is responsible not only for his own acts but for the individual and several acts of all other partners as well. Rather than risk an erroneous interpretation of the position of the National Bureau of Casualty Underwriters, a memorandum of the bureau is quoted:

> The additional charge for partnership liability coverage reflects the fact that at law each partner, in addition to being responsible individually for his own personal acts and those of his employees, is responsible individually for the conduct of all other partners and partnership employees. An injured person, therefore, may elect to sue the partnership, one or more of its partners, or single out a partner who had no personal participation in the medical or surgical services rendered.
>
> This legal situation is of particular significance in the medical professional liability lines affected because the coverage applies to injuries occurring during the policy period regardless of when they are discovered. Thus, the partnership or any partner thereof continues to be responsible for malpractice of a deceased partner. For other general liability lines, coverage applies only with respect to accidents which occur during the policy period. In other words, for all practical purposes, coverage ends at policy expiration or shortly thereafter for all general liability insurance except for the medical professional liability lines. This means that the coverage under the latter for a member of a partnership is broader than under general liability insurance.
>
> The rates for physicians, surgeons, and dentists, and for other medical professional individuals for which the partnership liability charge applies, are per person rates. These rates measure only the individual responsibility of the physicians, etc., for their personal acts. They do not reflect the additional responsibility he takes on as a partner and which comes about through operation of law. In other general liability lines, the rates, in effect, are rates for the business enterprise for liability arising out of the business operations whether it is individually owned, partnership or corporation owned. In the medical professional liability lines, liability arises out of personal services, services to the body. The injured person thinks in terms of individuals when he is injured because of real or alleged malpractice.

> Partnership risks, and when this term is used, we mean not only the risk consisting of two or three individuals but more particularly the clinic risk, have proven to be target risks in the practical experience of our companies. Whether this is attributable to the emotional agitation of a patient induced by the physical and mental examinations he may undergo at the hands of all doctors and employees comprising the partnership, or real or fancied wrongs amplified by the inability of the patient to say who in particular is responsible for such wrong, we do not know. We only know that from what limited experience is available partnership risks have proven to be worse risks than individual risks and that we should be unwarranted in imposing this increased exposure on all physicians, etc., in determining per person rates, most of whom may not be operating as partnerships.
>
> In return for the additional premium charge made for partnership liability, which additional premium charge we feel is justified because of the reasons mentioned, the Bureau program gives another set of limits. Thus, in a partnership risk involving four physicians all of whom are insured in the same company for individual and partnership liability coverage, five sets of limits could apply in an individual case instead of four which would apply if partnership liability were not separately considered.

Underwriters other than those belonging to the Bureau have varied methods of handling partnership risks. Some of them follow the Bureau practice, while others use different approaches. In practically all cases, however, an added charge seems to be the generally accepted practice. In view of the above, it would appear that there is some justification for an additional charge but studies to date do not disclose just what additional charge may be warranted. Some comfort may be derived from the fact that the additional 50% charge levied originally by the Bureau companies has now been reduced to 33⅓%. Additional attempts will be made to gather more information regarding this and similar practices.

Collateral Coverage: Frequently inquiries are directed to the office of the Council regarding the practice of some insurance companies in asking for other types of insurance when called upon to consider an application for professional liability protection. In checking this, it is understood that it is not the desire to influence the purchase of insurance that is not needed. Rather, it apparently reflects an attitude that these companies question the adequacy of present rates for medical liability insurance. In view of this, many companies request other types of insurance considered more desirable in the hope that the total experience will be more favorable.

A special study of the experience of one insurance company over a 32 year period revealed lack of uniform results as well as lack of success. On a per year basis the experience ranged from a profit of approximately $88,000 to an operating loss of nearly $450,000. Profits were reflected in 13 of the years, while losses were recorded for the other 19. On the basis of generally accepted loss allowable factors, the cumulative profits for the thirteen years amounted to a little more than $375,000 while the cumulative losses amount to over $2,000,000. The net loss for the entire period was only slightly less than $2,000,000. This may be among the factors behind requests for collateral business.

The increased frequency with which the medical profession becomes involved in liability suits or claims is complicated further by ever-increasing awards that are being granted by juries. Increased jury awards also have an effect on claims settled short of litigation. In New York the Malpractice Insurance and Defense Board of the medical society reported recently: ". . . During the past few years the average cost of disposal has increased over $500 per case, with corresponding increase in the reserves for those outstanding and those still to be reported. . . ." The 1954 report goes on to state ". . . Since there is not the slightest indication of any diminution in the rate of incidence or cost of disposal, we must frankly face the question as to what our situation will be five years or even one year from now."

General: Apparently the word "malpractice" does not have the same significance it had at one time. Seemingly an aggrieved patient or former patient no longer is required to prove malpractice in order to sustain a monetary award. A review of some cases might lend support to the observation that an accused physician now has the burden of proof that there was no malpractice. Several factors have a bearing but it is most difficult to assess their relative significance. Since awards and judgments are now made on the basis of liability, legally imposed or assumed, perhaps the term professional liability might have a less adverse implication than the term "malpractice" used so widely in the past.

The Council intends to continue its interest in these problems and will further its efforts toward their ultimate solution. Moreover, the Council plans to further its cooperation with the Law Department and other groups including staff liaison with insurance and medical organizations.

Conclusion: It is the hope of the Council that this summary, together with the report from the Law Department, will facilitate a comprehensive report to the House at this session. The Council is mindful of the interest of the profession in this important field as evidenced by the resolutions introduced in 1952 and subsequently as well as the following recommendation contained in the report of the Reference Committee on Insurance and Medical Service at the 1954 Clinical Meeting in Miami.

> Due to the apparent emergency aspect of the problem, the Board of Trustees is urged to report to the membership as soon as possible, through its component societies, on the progress of this urgent study.

The reference committee may have intended that any report to the membership should be channeled through the constituent associations and their component societies. From its efforts and knowledge to date, the Council is convinced that there are no ready answers to these problems at this time and therefore as yet has no definite program. There continues, however, the obligation to inform the profession with respect to the problems as well as the unique features of this type of underwriting so as to forestall either ill-advised or unwarranted action by the membership. To these ends, the Council offers its continuing services.

REPORT FROM LAW DEPARTMENT ON STUDY OF PROFESSIONAL LIABILITY INSURANCE AND CLAIMS PREVENTION PROGRAMS

Numerous articles have been written and a number of studies have been made concerning professional liability. Generally these articles and studies are neither accurate nor complete, but state impressions and opinions which may or may not have any actual basis in fact. The Law Department has not been able to locate and to its knowledge there does not exist a current comprehensive, factual or statistical study of professional liability claims and cases.

The Law Department, with the cooperation of other Councils and Committees of the Association, is engaged in a survey which it hopes to conduct in an objective, judicious manner with the view of formulating a comprehensive report on the subject of professional liability as it exists in the United States plus affirmative suggestions for reducing such claims.

Status of Survey: Since submitting its initial and preliminary report on this subject dated May 26, 1955, the Law Department has continued to work in cooperation with the Council on Medical Service and the Committee on Professional Liability of the Committee on Medicolegal Problems. In the six month period covered by this report the Department has been engaged in the following major activities in this field:

(1) An analysis was made of pertinent state statutes dealing with insurance rates and regulations. This information, for the most part, was obtained from answers to a questionnaire prepared jointly with the Council on Medical Service, which was sent to each State Insurance Commissioner.

(2) A questionnaire was prepared and distributed to national medical societies inquiring as to the types of coverage afforded to their members and their experience, if any, with group professional liability insurance programs.

(3) An exhaustive questionnaire was prepared, pre-tested and distributed to the 48 states and the District of Columbia medical societies. The three part questionnaire is designed to elicit information concerning (*a*) insurance carriers and the amounts and types of professional liability insurance coverage available, by state; (*b*) experience, if any, or views concerning group coverage; (*c*) the incidence, the most common causes, and the results of professional liability claims; (*d*) the existence, types, methods of operations, and success of claims prevention programs; and (*e*) statistical data relative to the number and disposition of claims and suits, professional liability insurance experience, and rate changes during the past ten years.

(4) Information received through the questionnaire referred to in (3) above was supplemented through personal visits by members of the staff of the Law Department to the medical societies of California, New York, Pennsylvania, Oregon, and Utah.

State Insurance Laws and Regulations: As indicated above the questionnaire concerning state statutes and regulations dealing with professional liability insurance was sent to every State Insurance Commissioner. In general, inquiry was made concerning the type and extent of authority vested in the Commissioner to control or regulate professional liability insurance rates, the person or agency administering the authority, if any, and the citations to the statutes or regulations. For the most part, statutes regulating these rates are found in the sections of the insurance law relating to the regulation of casualty or other types of insurance except fire or marine insurance.

Most of the state statutes provide that (*a*) an insurance carrier must file with the State Insurance Commissioner every manual of classifications, rules, and rates, every rating plan and every modification of any of the foregoing which it proposes to use: (*b*) the carrier must supply any substantiating material requested; (*c*) the Commissioner must review this material as soon as reasonably possible to determine whether it meets the requirements of the statute; and (*d*) the filing is deemed to have met the requirements of the statute unless expressly disapproved by the commissioner within a specified period. A few statutes require that the rates be approved in writing by the commissioner before they become effective. Two states, Montana and Washington, do not exercise any control over professional liability insurance rates.

Information Received from National Medical Societies: The questionnaire inquiring as to the type of professional liability insurance coverage available to the membership of eleven national medical societies was completed and returned by each association contacted. Four indicated that they are currently either offering group coverage or indorsing a particular policy for their membership.

Information Received from State Medical Societies: The questionnaire described in (3) above was sent to the 48 states and the District of Columbia medical societies on Sept. 6, 1955. Follow-up letters were sent to the societies that had not replied on Oct. 17, 1955. Unfortunately, this phase of the study is incomplete inasmuch as replies have only been received to date from 30 states. Another follow-up letter will be sent this month in a further effort to obtain information from those states which have not responded to the two earlier inquiries. Until more complete information is received it will be necessary to generalize concerning the types and amounts of insurance coverage available, the most prevalent problems in the field, and the status of claims prevention programs. Any statistical information concerning insurance rates, the incidents of claims and suits, and the disposition of such cases will also be reserved until the final report.

Of the 30 states replying, 6, California, Georgia, New York, Oregon, Rhode Island, and Washington, indicated that they offer group professional liability insurance or have at some time sponsored or endorsed such insurance on a state or county basis. However, 18 states—Arizona, California, Colorado, Connecticut, Georgia, Kansas, Mississippi, Missouri, Montana, New Jersey, New York, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Virginia, and Washington—have committees on a state or county basis that review professional liability claims brought against members.

One of the questions in the questionnaire deals with the most common causes of liability claims. The following are the causes and aggravating circumstances most frequently listed thus far: (*a*) x-ray burns; (*b*) foreign body left in patient following surgery; (*c*) imperfect result following orthopedic surgery; (*d*) failure to obtain consent prior to surgery; (*e*) inaccurate prescription of drugs or improper diagnosis; (*f*) criticism of one physician by another; (*g*) excessive fees; and (*h*) poor physician-patient relationship. It is interesting to note that one state volunteered the information that at least 90% of their professional liability claims had some justification, whereas another state expressed the belief that only 30% of the claims had merit.

The second question requested information as to what effect a professional liability claim had on the reputation and practice of the physician involved. The overwhelming opinion expressed in response to this question was that the effect was slight, if any. Some of the states felt that a physician's reputation is adversely affected in small communities where liability claims receive a great deal of newspaper publicity.

All of the states submitting replies stated that professional liability insurance was available and that it was not difficult for physicians to obtain. A total of 45 companies, foreign and domestic, were listed as providing some type of professional liability coverage. A few states noted that it was difficult for a physician who had had a malpractice experience to obtain insurance. Two states indicated that coverage was unavailable for brief periods.

Information was also requested as to the limits of insurance coverage carried by general practitioners, surgeons, and other specialists. The answers to this question varied from state to state as well as within a state among physicians in these categories. Eight states reported that all physicians carried substantially the same limits of coverage. Four states did not know what limits their physicians had, and two others indicated that surgeons and specialists carried substantially higher limits than general practitioners.

As stated earlier, 18 states indicated that they have committees to review professional liability claims. In general, these committees review the claims which are brought to their attention, determine to the best of their ability whether the defendant physician has been negligent or not, and advise the underwriters as to whether, in their opinion, the claim should be settled or defended. Some committees or medical societies in addition provide expert medical testimony for the defendant physician. One county society indicated that on its own initiative it provides a medical expert witness, in certain cases, for the patient.

Only a few states reported that they had claims prevention programs. In general, they consisted of lectures given to physicians prior to their admission to the medical society and periodically thereafter to the entire membership of the society. The only other educational activities in this field consist of the preparation and distribution of pertinent articles and other literature which are printed in the state and county medical journals.

Visits to State Medical Societies: At the suggestion of Dr. Louis J. Regan, Chairman of the Committee on Professional Liability, and in an effort to obtain additional information, members of the staff of the Law Department have visited five states and several counties having particular information concerning group insurance on claims prevention programs. Mr. William J. McAuliffe visited the Los Angeles County Medical Association, the Orange County Medical Society, the Alameda-Contra Costa Counties Medical Society, and the San Francisco Medical Society, all of California, in June, 1955. He visited the Medical Society of the State of Pennsylvania in September, 1955, and the Queens county and the New York state medical societies in October, 1955. Mr. Edwin J. Holman visited the Utah State Medical Association in September, 1955, and Mr. R. G. Van Buskirk visited the Oregon State Medical Society in the same month. The Department is grateful for the cooperation and assistance which was offered by each of the societies visited. It is contemplated that additional visits will be made to those states which indicate on their questionnaires that they have group insurance or an active and effective claims prevention program.

Other Phases of the Program: As part of further investigation into the field of professional liability it is proposed to conduct a number of additional activities including:

(1) Survey of Professional Liability Experiences in Other Countries: The Law Department believes it is important to compare American professional liability problems with those which face the medical profession in other countries. It is therefore proposed that a survey be conducted of the experience in countries such as England, Australia, Canada, Norway, Sweden, France, and Italy. A questionnaire is now being prepared which will be sent to the national medical associations of these countries and to other organizations that are active in this field.

(2) Survey of Practicing Physicians: A questionnaire is being prepared to be sent to a significant number of physicians throughout the United States so that a tabulation and study of their personal and individual experiences and opinions can be obtained. This step is necessary to permit us to go beyond expressions of opinion from medical society personnel and to ascertain the experiences of physicians who may not be active in organized medicine. This questionnaire will be sent to a representative number of physicians in each of the states so that a tabulation on a state and possibly a regional basis can be made.

The replies will be broken down by age groups and into classifications of specialized practice. In each community, a questionnaire will be sent to a representative number of general practitioners, surgeons, radiologists, etc. In this way we should be able to determine with reasonable accuracy the number of claims that have been made against physicians, the number covered by insurance, the extent to which insurance coverage has been inadequate, etc. If the information revealed in this phase of the survey is significant, it may be possible to suggest an intensive claims prevention program as well as a program of safety precautions for physicians and hospitals, planned and organized under the aegis of organized medicine.

(3) Survey of Attorneys: We are also interested in the experiences, opinions, and attitudes of attorneys who participate in professional liability claims—both defense and plaintiffs counsel. It is proposed that a questionnaire be sent to about 300 plaintiffs' and 300 defense attorneys. The recipients will be selected on the basis of their activity in the field of personal injury work. In addition to the questionnaires, we plan to interview personally leading attorneys, who are active in the prosecution and defense of these claims.

From the plaintiffs' attorneys, we are interested in the nature of the claims which they accept for legal representation as well as those, if any, which they decline, and the case histories of typical cases they have settled and the amounts. Is it usually necessary to file suit? Their experiences with the insurance companies—whether they are difficult or easy to deal with. Their experiences with medical society "malpractice" committees. Is it difficult to obtain expert medical testimony in "malpractice" cases? Are the attending physicians cooperative with respect to disclosing medical data regarding previous treatment? Are they reluctant to testify against other physicians in borderline cases? Clear-cut cases? Are lawyers in small communities reluctant to take cases against local doctors? Are these cases usually handled on a contingent fee basis? Are they frequently settled where there is no insurance? Are claims usually made against physicians who have insurance? etc.

We shall also contact the medicolegal committees of state and local bar associations. We believe that we are in a position to secure the cooperation of these men in obtaining frank statements of opinion and information as to their experiences. We do not propose to limit our activities here to one part of the country but to select representative cities and rural areas.

(4) Survey of the Judiciary: We are also interested in obtaining an insight into the thinking of judges who sit in judgment of physicians in malpractice cases. We believe it is essential to know their personal attitude toward the medical profession and their opinion concerning the verdicts awarded in these cases. It has not been decided as yet whether a questionnaire is feasible. However, in any event attempts will be made to interview personally a significant number of judges.

(5) Analysis of State Legislation and Reported Cases: An analysis of state statutes and reported cases should provide valuable information. Admittedly, reported cases for the most part include only those in which important points of law relating to liability are involved. Nevertheless the importance of such cases cannot be underestimated. An analysis of such cases should provide data as to the areas of medical practice in which professional liability claims occur most frequently, the circumstances usually surrounding such claims, the amounts of judgments, etc. This analysis will cover in detail all reported cases of the last 20 years, broken down on a five year basis so that significant trends can be observed. Comparisons, similarities, and differences in state statutes and reported cases will be noted. From this phase of the study it is possible that some recommendations can be formulated for model legislation covering the field of professional liability.

(6) Survey of Comparable Fields of Negligence Actions: Primarily, it has been the practice to consider professional liability as a separate problem of the medical profession. Actually, this represents only a single type of personal injury claims arising from negligence. We believe it would be advisable to study the larger problem. There is reason to believe that the same factors which influence the institution of personal injury claims in other fields of liability also affect the institution and determination of professional liability claims. If this premise is borne out in our investigations, further study of the defensive and preventive measures taken to minimize liability in these other fields of negligence cases seems warranted.

It is recognized that the personal injury lawyer who represents plaintiffs in personal injury claims is the lawyer who will also represent professional liability claimants. The expert medical witnesses who spend much of their professional life in the court room testifying in automobile and public liability cases are the ones who also appear most frequently in professional liability cases. We therefore contemplate a study of automobile claims, public liability, product liability, and tort claims in general for the purpose of studying comparability and differences that may exist with professional liability claims. Our study will deal with the statistics, reported cases, and available literature in the field of tort claims.

(7) Study of Insurance Experience and Rates: With the active cooperation of the Council on Medical Service it will be necessary through personal visits and correspondence with insurance companies writing this type of coverage to obtain in detail and by geographic area their experience for the past 10 years. Specifically we are interested in statistical data relative to the number and disposition of claims and suits, professional liability insurance experience, rate structures, and changes. Also of importance are differences in claims settlement policies, the existence and content of claims prevention programs, as well as the opinions of insurance officials as to future trends and desirable corrective measures. We also hope to have an opportunity to review the changes that have taken place in insurance rates in other fields of liability and the factors that influenced these changes, for the purpose of comparison.

(8) Preparation and Publication of Special Articles: As an integral part of our efforts in the field of professional liability, the Law Department with the Committee on Medicolegal Problems intends to prepare and publish in THE JOURNAL a series of significant articles which will later be coordinated as part of the entire survey. These studies will include monographs on subjects such as the following:

"The Law of Professional Liability" (An outline of the basic law related to malpractice claims with a discussion of leading United States cases).

"The Res Ipsa Loquitur Case" (A discussion of cases in which the court has found the liability is apparent or it "speaks for itself").

"The Rule of Respondeat Superior" (A discussion of the professional liability of physicians resulting from the acts of partners, office associates, and staff personnel).

"The History of Professional Liability Claims in the United States."

"Professional Liability Claims in Other Countries."

"Professional Liability Claims Prevention" (A discussion of the measures that physicians may take to prevent and minimize professional liability claims).

"Put It in Writing, Doctor" (A discussion of when the physician should document the physician-patient relationship by a written agreement or a formal written consent).

"Hazardous Therapy" (A discussion of the use of hazardous therapy such as shock therapy, myelograms, spinal taps, spinal anesthesia, use of experimental drugs, etc.).

"Timely Use of Consultants."

"Safety Engineering in Medical Practice" (Use of sound management procedures and safety measures to prevent medical accidents in the office and the hospital.

"Expressing Opinions as to Former Treatment."

The above are examples of the type of articles which we believe will assist in formulating an effective claims prevention program. It may also be possible with the Public Relations Department to prepare material for general distribution to the public. These pamphlets, of course, would not deal specifically with malpractice but with topics to improve doctor-patient relations.

Conclusion: We realize that the foregoing encompasses an ambitious program. However, we believe that it is necessary if we are to obtain a broad perspective of (*a*) the methods of decreasing as well as the causes or incidence of professional liability claims, and (*b*) the availability, costs, and trends in professional liability insurance. To accomplish its goal, the Law Department will need the continued fine cooperation of the Council on Medical Service and the Committee on Medicolegal Problems, and in addition still greater assistance from the state and county medical societies.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, which was adopted:

Supplementary Report N on Professional Liability: A representative of the Law Department appeared before your reference committee and explained that this is in the nature of a progress report outlining studies now under way by that Department. He further emphasized that the department requests the constituent and component societies to collaborate to the fullest possible extent and urges individual physicians to render their good offices in the completion of this study.

This report also directs attention to the fact that, "although over 250 insurance companies are legally qualified to write professional liability insurance in those areas in which they are licensed, relatively few of them express any active interest in doing so. Some of them prefer to write this business only on an accommodation basis for those physicians who carry other lines of insurance with them." This survey of professional liability insurance and claims prevention programs is indeed timely. Your committee commends the Law Department and the Council on Medical Service for the report.

O. Clinical Psychologists

Supplementary report O was referred to the Reference Committee on Hygiene, Public Health, and Industrial Health.

In December, 1952, the House of Delegates approved a recommendation that future proposals for the certification or licensure of psychologists should be carefully studied to determine whether they are in accord with these principles: that psychotherapy is an integral part of the practice of medicine and that clinical psychologists cannot be qualified by their training and experience to function independently as psychotherapists. At the Miami Clinical Meeting in 1954 the House approved a joint statement on relations of medicine and psychology which had been previously approved by the Board of Trustees and the executive bodies of the American Psychiatric Association and the American Psychoanalytic Association.

In view of the fact that psychologists are continuing to obtain the passage of licensure or certification laws in some of the states in spite of state medical association opposition, the Board recommends opposition by the American Medical Association to the licensure of psychologists.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, read the following report, which was adopted.

Supplementary Report O on Clinical Psychologists: Your reference committee approves this recommendation.

P. Resolution on Changes in Legal Status of Epileptic

Supplementary report P was referred to the Reference Committee on Legislation and Public Relations.

Resolution No. 76 (June, 1955) urging the Association to have its "component societies" support legislation relaxing the attitude toward epileptics so far as marriage, eugenic sterilization, motor vehicle licenses, and workmen's compensation laws are concerned was considered by the Council on Mental Health and the Committee on Legislation. There is at the present time sufficient medical evidence that great strides have been made in the treatment of epilepsy and the control of epileptic seizures. However, the Board of Trustees believes that because of the difficulty in formulating legislation and the long established custom of not doing so, it should do no more than affirm the factual portion of the reference committee report, leaving the constituent societies free to act or not as they may decide.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, submitted the following report, which was adopted:

Supplementary Report P on Changes in Legal Status of Epileptics: Your reference committee approves this report.

Q. Resolution on Ophthalmologic-Optometric Relations

Supplementary report Q was referred to the Reference Committee on Miscellaneous Business.

Resolution No. 58 (June, 1955) recommending several actions by the Board and other groups (i. e., among others, discharge of the National Committee on Eye Care, appointment of a permanent committee on eye care, revision of Public Law 734, part 4, Section 341E, clause 10) was referred to the Judicial Council and to the Committee on Legislation for study. These groups are at the present time reviewing the matter and a study of state laws relating to optometry is planned. The Board wishes, therefore, to withhold implementation of the resolution until a complete report is received on the contemplated studies.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, presented the following report, which was adopted:

Supplementary Report Q on Resolution on Ophthalmologic-Optometric Relations: Your reference committee concurs in the recommendation of the Board that the implementation of this resolution be withheld until complete reports on this subject are received from the Judicial Council and the Committee on Legislation. Your reference committee recommends that this supplementary report of the Board of Trustees be adopted.

R. Committee on General Practice Prior to Specialization

Supplementary report R was referred to the Reference Committee on Medical Education and Hospitals.

The Board of Trustees considered the report of the Committee on General Practice Prior to Specialization, which was accepted by the House of Delegates in June, 1955, and is in agreement with the recommendations contained therein except that the Board recommends a smaller committee of 9 members, instead of 11, to be composed of 2 members of the Board, 2 from the Council on Medical Education and Hospitals, one from the Council on Medical Service, and 4 from the House of Delegates, 2 of whom should be general practitioners. None of the nine members should be deans or full-time professors in medical schools or officers or directors of any specialty board. The appointees will be selected in the next few weeks.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George M. Fister, Chairman, Utah, read the following report, which was adopted:

Your reference committee has reviewed supplementary report of the Board of Trustees R, entitled "Committee on General Practice Prior to Specialization." Your reference committee notes with interest the development of this committee for the study of general practice prior to specialization.

S. Medical Relations in Workmen's Compensation

Supplementary report S was referred to the Reference Committee on Hygiene, Public Health, and Industrial Health.

The report of the Council on Industrial Health presents a guide for the evaluation and implementation of a program in workmen's compensation for the medical profession. The Board, after carefully considering this report, recommends its adoption by the House of Delegates.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, read the following report, which was adopted:

Supplementary Report S on Medical Relations in Workmen's Compensation: Your reference committee approves this recommendation of the Board of Trustees.

T. Federal Civil Defense Administration Improvised Hospitals

Supplementary report T was referred to the Reference Committee on Medical Military Affairs.

The Council on National Defense of the American Medical Association considered a resolution from the Medical Advisory Committee to the Administrator of the Federal Civil Defense Administration relative to improvised hospital units and recommended endorsement of the use of the 200-bed improvised hospital. Inasmuch as the improvised hospital is recognized as an essential means of augmenting existing medical facilities during and after disaster, including enemy action, and for providing lifesaving medical care, the Board adopted the recommendation of its Council on National Defense that the 200-bed improvised hospital of the FCDA be endorsed by the House of Delegates.

REPORT OF REFERENCE COMMITTEE ON MEDICAL MILITARY AFFAIRS

Dr. Charles H. Richardson Sr., Chairman, Georgia, read the following report, which was adopted:

Your reference committee endorses the 200-bed improvised Civil Defense hospital described in the report of the Council on National Defense and in supplementary report T, as an essential means of augmenting existing medical facilities during and after disaster. It further urges that all assistance be provided by the Federal Civil Defense Administrator to local communities in target areas so that early distribution of improvised Civil Defense hospitals will be made for training purposes.

Your reference committee suggests that the name of the hospital be changed from "200-bed improvised hospital" to 200-bed emergency Civil Defense hospital" as the organization, placement, operation, and supply of the hospital are well defined and there is or should be little improvisation so that the term emergency Civil Defense hospital is appropriate.

U. Resolution on Repeal of Sections 106 and 222 of Public Law 761, 83d Congress

Supplementary report U was referred to the Reference Committee on Legislation and Public Relations.

Resolution No. 5 (June, 1955) requesting the repeal of Sections 106 and 222 of Public Law 761, 83d Congress, and the request of the House for an opinion as to its practical aspects were considered by the Committee on Legislation and the Board of Trustees.

The Board adopted the recommendation of its Committee on Legislation that the Association, in testifying on H. R. 7225, 84th Congress, recommended the repeal of Sections 106 and 222 and the enactment in their stead of a provision for the use of the best 5 or 10 years in the computation of Social Security benefits. The Board believes that this action is consistent with the Association's previous position, will relieve the present threat of extension of the disability sections, and will be more feasible and economical to administer than the present provisions which call for medical determinations of physical and mental disability.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

The report of the reference committee on supplementary report U will be found following supplementary report B on page 1650 of this issue of The Journal.

V. Contribution to American Medical Education Foundation

The Vice Speaker declared that supplementary report V was for information only and needed no referral.

The Board of Trustees at this time wishes to announce that it again has appropriated $100,000 for the support of the medical schools of the nation and will turn over these funds to the American Medical Education Foundation. The Board continues to assume the administrative expenses connected with the solicitation of funds, so that all contributions are forwarded to the medical schools.

W. Annual and Clinical Meetings

Supplementary report W was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

Consideration has been given by the Board of Trustees to the invitation from Chicago for the 1960 Annual Meeting of the Association. Accommodations in Chicago have been found to be adequate for a meeting of the Association.

Invitations for the 1958 Clinical Meeting have been received from Dallas, Texas; Denver; Houston, Texas; Minneapolis; St. Louis; and Washington, D. C. The Board is pleased to announce acceptance of the invitation from Minneapolis as the place for the 1958 Clinical Meeting of the Association.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Homer M. Izumi, Chairman, Hawaii, submitted the following report, which was adopted:

Supplementary Report W, on Annual and Clinical Meetings: Your committee recommends acceptance of the invitation of Chicago for the 1960 Annual Meeting of the Association, and notes the action of the Board in accepting the invitation of Minneapolis for the 1958 Clinical Meeting.

Citation to Dr. Torald Sollmann

Dr. Gunnar Gundersen, Chairman of the Board of Trustees, presented a citation to Dr. Torald Sollmann with the following remarks:

Mr. Speaker, Members of the House of Delegates, and Guests: It is my great privilege at this time to present a citation to a man who is not only one of the most distinguished members of the medical profession, but also one of its most beloved, Dr. Torald Sollmann of Cleveland, Ohio. To give you the complete story of Dr. Sollmann's long and varied career would take many hours. I shall touch on just a few of the highlights.

At the age of 17 he became the youngest person ever to obtain a pharmacist's license in Ohio up to that time. In 1896, when he was 22, he received his M.D. degree from the medical school at Western Reserve University. Two years later he was appointed lecturer in pharmacology, and in 1904 he became a full professor of pharmacology. One of Dr. Sollmann's first accomplishments as a professor was to write the first English language textbook on pharmacology. This 100-page work on laboratory experiments was a modest forerunner of his later 1,000-page "Manual of Pharmacology," which now is in its seventh edition and is regarded as a standard textbook in all medical schools and research organizations. From 1928 to 1944, when he retired after nearly 50 years of active service at Western Reserve University, Dr. Sollmann was Dean of the School of Medicine. Throughout all those years and up to the present time, his name has become practically synonymous with the work of the Council on Pharmacy and Chemistry of the American Medical Association. He personifies the Council's motto, "Non sibi sed medicinae"—"Not for ourselves but for medicine."

Dr. Sollmann, I should like to read this citation to you and our audience:

Citation

"The American Medical Association takes pleasure in presenting this citation to Torald Sollmann, M.D., in recognition of his many years of outstanding service to the medical profession and on behalf of the advancement of medical science.

"A charter member of the Council on Pharmacy and Chemistry for 50 years and chairman of the Council since 1936, Dr. Sollmann has had a distinguished career as physician, teacher, researcher, technical advisor to his government, and author of standard texts in pharmacology. His unselfish devotion and inspiring leadership have been largely responsible for the Council's achievements in encouraging rational therapeutics."

Remarks of Dr. Torald Sollmann

In accepting the citation, Dr. Sollmann made the following remarks:

Thank you very much, gentlemen, for this honor. It has been a privilege which I have greatly appreciated to be able to work on the Council on Pharmacy and Chemistry for the betterment of therapeutics. The honor which you are doing to me is an honor to all of those who have worked with me on the Council. I am, I think, the only surviving member who attended the first meeting of the Council, and, with Dr. Novy, we two represent the members of the original Council. To all those who, during the years, have worked on this project as members of the Council and the staff of the Council, and back of them, you, the delegates and the trustees, who have always enthusiastically supported this work, my profound thanks.

(To be continued)

MEDICAL NEWS

CALIFORNIA

University News.—The College of Medical Evangelists, Los Angeles-Loma Linda, recently dedicated a new $100,000 anatomy amphitheater seating 178 on its Loma Linda campus. At a dedicatory program, Nov. 22, Dr. Otto F. Kampmeier, head of the anatomy department, spoke on the progress of education in the field of anatomy.

Cerebral Palsy Center.—In compliance with a request of the state of California, the College of Medical Evangelists, Loma Linda-Los Angeles, will establish a diagnostic and treatment center for cerebral palsied children at the White Memorial Clinic. The college will cooperate particularly with the State School for Cerebral Palsied Children now operating in Altadena. The budget provides $17,000 for setting up additional service at the White Memorial Clinic under the direction of Drs. Robert F. Chinnock and Joseph E. Maschmeyer.

Course on Hypnosis.—An intensive course in techniques and application of hypnosis (fee $100) will be offered by University of California School of Medicine and University Extension, Los Angeles, Jan. 19-21 (Thursday and Friday sessions, 9 a. m. to 12 noon and 1:30-4:30 p. m.; Saturday session, 9 a. m.-1 p. m.). Requests for information should be made to Dr. Thomas H. Sternberg, assistant dean for postgraduate medical education, University of California Medical Center, Los Angeles 24. The course is open only to graduates of approved medical schools and to psychologists with Ph.D. degrees, with consent of the course chairman, Roy M. Dorcus, Ph.D., professor of psychology in the university's department of psychology and the school of medicine.

Retiring Teachers.—Dr. Phoebus Berman, who will retire Jan. 10, 1956, as medical director of the Los Angeles County Hospital, was a guest of honor at the banquet of the Medical Alumni Association of the University of Southern California School of Medicine, Nov. 4. Dr. Berman is a clinical professor of medicine on the faculty of the school of medicine. Scrolls of honor were awarded the following members of the faculty who are retiring to emeritus status: Dr. Ray A. Carter, emeritus professor of radiology; Dr. Finis G. Cooper, emeritus assistant clinical professor of surgery; Dr. Ezra S. Fish, emeritus professor of pediatrics; Dr. Simon Jesberg, emeritus associate clinical professor of surgery; Dr. E. Eric Larson, emeritus clinical professor of surgery; Dr. Frederick H. Linthicum Sr., emeritus associate clinical professor of surgery; Karl F. Meyer, Ph.D., emeritus lecturer in public health; Dr. W. William Mulvehill, emeritus assistant clinical professor of medicine; and Dr. Gilbert Roy Owen, emeritus associate clinical professor of surgery.

Society News.—At the annual meeting of the California Society of Internal Medicine in Santa Barbara, Oct. 1, the following officers were chosen: Dr. George K. Wever, Stockton, president; Dr. William C. Mumler, Los Angeles, vice-president; and Dr. Claude P. Callaway, San Francisco, secretary-treasurer. The guest speakers were Dr. Samuel Soskin, Los Angeles (Diabetes Mellitus, Theory and Practice); Dr. Helen E. Martin, Los Angeles (Electrolyte Changes in Diabetic Acidosis); Dr. Peter H. Forsham, San Francisco (Theories on the Cause and Correction of the Degenerative Stigmata of Diabetes Mellitus); and Dr. Percival A. Gray Jr., Santa Barbara (Practical Aspects of Training the Diabetes Patients as to Diet). Dr. Soskin acted as moderator for a panel discussion, "What Is the Optimum Level of Control for the Diabetic Patient?" A medical economic forum was held to discuss "The Trend of Health Insurance," with Dr. Robert M. Shelton of Pasadena as moderator. Mr. Ed Clancy, director of public relations of the California Medical Association, was the main speaker.

FLORIDA

Society News.—In October the Orange County Medical Society published the first issue of its quarterly bulletin. Dr. Don C. Robertson, Orlando, president of the society, is editor. The bulletin office is at 1206 Kuhl Ave., Orlando (phone 5-5108).

Personal.—Dr. Hyman J. Roberts, West Palm Beach, recently presented at St. Mary's Hospital, West Palm Beach, a six-week course on electrocardiography and cardiology as a guest lecturer of the section on general practice of the Palm Beach County Medical Society.

Seminar in Ophthalmology and Otolaryngology.—The 10th annual University of Florida Midwinter Seminar in Ophthalmology and Otolaryngology will be held at the Sans Souci Hotel in Miami Beach, Jan. 16-21, 1956. The seminar lecturers on ophthalmology (Monday, Tuesday, and Wednesday) are: Drs. Francis H. Adler, Philadelphia; A. Gerard DeVoe, New York; Michael J. Hogan, San Francisco; C. Wilbur Rucker, Rochester, Minn.; and Albert D. Ruedemann, Detroit. Those lecturing on otolaryngology (Thursday, Friday, and Saturday) are: Drs. Frederick A. Figi, Rochester, Minn.; Lewis F. Morrison, San Francisco; Charles E. Kinney, Cleveland; John R. Lindsay, Chicago; and Bernard J. McMahon, St. Louis.

ILLINOIS

Artery Bank.—On Oct. 11 a central artery bank, supported by the Chicago Heart Association, was opened at the Hektoen Institute for Medical Research, Chicago. Procurement of suitable arterial segments is based on postmortem material of the Cook County Hospital. Sterilization, lyophilization, and storage of blood vessels are accomplished at the bank. Segments can be obtained by those whose training in vascular surgery is known or for whose ability the surgical staff at the requesting hospital can vouch. Surgeons interested in obtaining such segments may obtain information by calling Miss Naomi McElwain at MOnroe 6-0787.

Chicago

Course on Bronchoesophagology.—The University of Illinois College of Medicine will present its next laryngology and bronchoesophagology course March 5-17, 1956, under the direction of Dr. Paul H. Holinger. Interested registrants should write to the Department of Otolaryngology, University of Illinois College of Medicine, 1853 W. Polk St., Chicago 12.

Dr. Gerard Goes to Michigan.—Dr. Ralph W. Gerard, professor of neurophysiology at the University of Illinois College of Medicine, has been appointed professor of neurophysiology at the University of Michigan Medical School, Ann Arbor, where he will be associated with the Mental Health Research Institute. Dr. Gerard has been affiliated with the University College in London, England, and the Kaiser Wilhelm Institute in Berlin, Germany. For 25 years he served on the staff of the University of Chicago.

Multiple Sclerosis Research.—The Multiple Sclerosis Foundation of America has presented $25,000 to Northwestern University Medical School to support research in progress as a team project among five departments at the school. Dr. Lewis J. Pollock, emeritus professor and chairman of the department of neurology and psychiatry, is in charge of the program. The foundation has given $125,000 to Northwestern University in the past five years for studies that might yield information toward finding the cause of the disease or a treatment for it.

Personal.—Dr. Gerhart J. Piers, secretary, Chicago Psychoanalytic Society, has been appointed to succeed Dr. Franz G. Alexander as director of the Institute for Psychoanalysis (664 N. Michigan Ave.) when Dr. Alexander retires in the

---

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education, and public health. Programs should be received at least three weeks before the date of meeting.

fall of 1956. Dr. Piers, a native of Vienna, Austria, has been affiliated with the institute since 1942. He formerly served as a staff psychiatrist at Elgin (Ill.) State Hospital, as acting director of the Chicago Community Clinic, and as a member of the staff of the Veteran's Rehabilitation Center.——Dr. Jules H. Masserman, professor of neurology and psychiatry, Northwestern University Medical School, was recently asked by various universities and neuropsychiatric societies to lecture in Brazil, Uruguay, Argentina, Chile, Peru, Costa Rica, and Guatemala. The tour, also sponsored by the World Health Organization, was designed to foster closer scientific liaison with academic, clinical, and research centers in Latin America. Dr. Masserman, author of a new book, "Practice of Dynamic Psychiatry," is president-elect of the American Society of Group Therapy, vice-chairman of the section on psychotherapy of the American Psychiatric Association, president of the Illinois Psychiatric Society, and scientific director of the National Foundation for Psychiatric Research.

University News.—The Chicago Medical School announces the appointment of Dr. Paul B. Szanto as associate professor of pathology, Dr. Harry H. LeVeen as associate professor of surgery, and Dr. Irving C. Sherman as clinical professor of neurology and chief of the division of neurology. The school also announces the following promotions: Dr. David Presman, clinical associate professor of urology; Dr. Samuel R. Rubert, clinical assistant professor of orthopedic surgery; Dr. Howard H. Bass, clinical associate in urology; Dr. Robert D. Crane, clinical associate in surgery; Dr. Louis Richmond, associate in medicine; and Dr. Lester Wishingrad, instructor in pediatrics.——Northwestern University Medical School announces promotion of the following physicians to the rank of associate professor, effective Sept. 1, 1955: Alfred D. Biggs and Meyer A. Perlstein, pediatrics; Samuel M. Bluefarb, dermatology; Craig W. Borden and Frederick W. Fitz, medicine; T. Howard Clarke and John E. Kearns Jr., surgery; Clinton L. Compere, John R. Norcross, and Vernon Clifford Turner, orthopedic surgery; and Albert Milzer, bacteriology.——Dr. Ruth Rhines, formerly associate in medicine, University of Pennsylvania School of Medicine, Philadelphia, has been appointed associate professor of anatomy in the University of Chicago division of biological sciences. Dr. Rhines previously served as instructor in medicine at the University of Illinois College of Medicine and assistant superintendent of the Municipal Contagious Disease Hospital in Chicago.——Dr. H. Waldo Bird Jr., Detroit, former faculty member of the Wayne University College of Medicine, Detroit, has been appointed associate professor of psychiatry at the University of Chicago School of Medicine.

IOWA

Farmers with Heart Ailments.—A pilot project has been initiated under the sponsorship of the American and Iowa heart associations to help farmers in Washington County who suffer from heart ailments. Its objectives will be to determine the physical capacity of farmers who have such difficulties and to help them, through medical and social counseling, to remain active within their physical limitations—either in or outside of agriculture. Dr. Lewis E. January, professor of internal medicine, State University of Iowa College of Medicine, Iowa City, will be the responsible investigator. A liaison committee of the Washington County Medical Society consists of Drs. Guy E. Montgomery, Washington, Jay R. Miller, Wellman, and Dwight G. Sattler, of Kalona. The program will be conducted by a local steering committee, local physicians, and a "clinic team," of which Dr. Montgomery is chairman.

MARYLAND

Services for Crippled Children.—The James Lawrence Kernan Hospital and Industrial School for Crippled Children, Baltimore, has opened a rehabilitation center that will place special emphasis on prosthesis and special bracing problems. Clinics will be held on the second Monday of each month at 2 p. m. under the direction of Dr. Milton J. Wilder, Baltimore.

Dr. Roberts Accepts Chicago Post.—Dr. Dean W. Roberts, Baltimore, since 1952 director of the National Commission on Chronic Illness, has been appointed executive director of the National Society for Crippled Children and Adults (11 S. La-Salle St., Chicago 3) to succeed Mr. Lawrence J. Linck, who has been executive director of the society since 1945. Dr. Roberts is a lecturer in Public Health Administration at Johns Hopkins University, Baltimore.

MASSACHUSETTS

University News.—Dr. William Francis Ketchum, at one time assistant in pediatrics at the Tulane University of Louisiana School of Medicine, New Orleans, has been appointed assistant to the dean of the faculty of medicine at Harvard Medical School, Boston, where he will also serve as an instructor in pediatrics. Dr. Ketchum has been affiliated with Peter Bent Brigham Hospital, the Massachusetts General Hospital, and the Children's Medical Center in Boston and Babies Hospital in New York City.

Industrial Center for Paraplegic Rehabilitation.—An industrial rehabilitation department and neurosurgical service for paraplegics, dedicated to total care of the patient by specialists until he is fully restored to society, has been established at the Haynes Memorial department of the Massachusetts Memorial Hospitals in Boston under the joint sponsorship of the Liberty Mutual Insurance Company, the Massachusetts Memorial Hospitals, and the hospitals' affiliated medical school at Boston University. Funds to rebuild and reequip the east wing of Haynes Memorial Hospital were provided by Liberty Mutual. Dr. Donald Munro, former chief of services of Boston City Hospital and a consultant to the insurance company since 1949, is chief of service, assisted by Dr. Warren R. Sisson Jr. According to Dr. Chester S. Keefer, dean of the medical school, the center will be a teaching clinic for medical students and marks a new phase of medical education. The new unit provides accommodations for some 26 patients having paraplegia, an operating room equipped for neurosurgical procedures, facilities for x-ray and laboratory analysis and diagnosis, a lecture hall for teaching purposes, and physical therapy, ambulation, and recreational rooms. Rehabilitation nurse counselors, ambulation teachers, and physiotherapists are to be provided by the Liberty Mutual Rehabilitation Center in Boston. The services of the new department will be available to those injured in industrial accidents or patients with neurological disorders who are referred by physicians or from other clinics or insurance carriers.

MISSOURI

Dr. Mendeloff Goes to Baltimore.—Dr. Albert I. Mendeloff, associate professor of medicine and preventive medicine, Washington University School of Medicine, St. Louis, has been appointed full-time clinical chief of staff in medicine at the Sinai Hospital of Baltimore, associate professor in medicine at the Johns Hopkins University School of Medicine, and physician on the staff of the Johns Hopkins Hospital in Baltimore. Dr. Mendeloff, who has been associated with the Washington University School of Medicine since 1949, previously was affiliated with the Harvard Medical School, the Boston University School of Medicine, and Peter Bent Brigham Hospital, Boston.

NEBRASKA

University News.—Dr. Dwight M. Frost has joined the University of Nebraska College of Medicine staff as director of the new department of physical medicine and rehabilitation. He comes to the Omaha campus from the Institute of Physical Medicine and Rehabilitation at New York University-Bellevue Medical Center.

NEW JERSEY

Hospital News.—Half a million dollars was pledged recently by Johnson & Johnson and affiliated companies, manufacturers of surgical dressings and allied products, to help meet the hospital facilities capital expansion needs of the two New Brunswick hospitals, St. Peter's General and Middlesex General, which will share equally in the proceeds of the combined fund-raising campaign. The goal locally is to raise 3 million dollars, which would be augmented by an anticipated federal grant of 2 million dollars.

Memorial for Dr. Ward.—Dr. Raymond T. Potter, East Orange, was recently named chairman of the healing arts division for the $80,000 building fund campaign of the Florence Crittenton League of Newark. The campaign to finance improvements to the league's Newark home will be in the nature of a memorial to the late Dr. William R. Ward, who 54 years ago was responsible for founding New Jersey's first home for expectant unwed mothers, which later became affiliated with the Florence Crittenton League, a national society. Dr. Ward served as president of the home until his death earlier this year. On successful conclusion of the campaign, the league's Newark home at 2 Ogden St. will be renamed in honor of Dr. Ward.

NEW YORK

Professor of Preventive Medicine.—Dr. Archibald S. Dean of the Buffalo Regional Office, New York State Department of Health, has been appointed head of the department of preventive medicine and public health of the University of Buffalo School of Medicine.

Oldest Medical Radio Program.—At the annual meeting of the Monroe County Medical Society, Dec. 13, in the Rochester Academy of Medicine, a plaque commemorating the broadcasting of America's oldest continuous medical radio program was awarded to radio station WHAM, Rochester (NBC). The series was opened May 27, 1930, by Dr. Walter A. Calihan, Rochester, then president of the society. The plaque, which bears the inscription, "To WHAM from the Medical Society of the County of Monroe for twenty-five years of public service in broadcasting weekly talks 'Speaking of Health' for the good of all," was presented by Dr. Gordon M. Hemmett, Rochester, president of the county medical society; Dr. Frederick W. Bush, Rochester, chairman of the public relations committee; and Dr. Jean D. Watkeys, Rochester, chairman of the health education committee and current producer of the program, "Speaking of Health," heard on Saturdays at 1:15 p. m.

New York City

Lectures for the Laity.—In its 21st series of Lectures to the Laity, the New York Academy of Medicine, 2 E. 103rd St., will present "Cultural Mentalities and Medical Science" by Filmer S. C. Northrop, Ph.D., Sterling Professor of Philosophy and Law, Yale University, New Haven, Conn., at 8:30 p. m., Jan. 4, 1956.

Appointed Professor of Public Health.—Dr. Helen M. Wallace, who has been affiliated since 1943 with the New York City Department of Health, has been appointed director, department of public health, preventive medicine, and industrial hygiene, at New York Medical College, Flower and Fifth Avenue Hospitals. Dr. Wallace has held teaching appointments at Long Island College of Medicine (now State University of New York College of Medicine at New York City, Brooklyn), Teachers College, and the School of Public Health of Harvard University, Boston.

Scholarships in Reproduction.—The State University of New York College of Medicine in Brooklyn has received a grant of $24,000 from the Josiah Macy Jr. Foundation to support student research scholarships in the field of reproduction. The money will be divided into five awards of $4,800 to provide eight Josiah Macy Jr. Foundation Scholarships each year. Student scholarship winners will receive $500 each. The balance will be used for laboratory expenses. Scholarship winners will be selected by a faculty committee representing members of both the basic and the clinical sciences. Dr. Louis M. Hellman, head of the department of obstetrics and gynecology, is chairman of the committee.

Course on Radioactive Medicine.—The graduate division of New York University College of Engineering announces that next spring it will offer the first university course on the use of scintillation counters as research tools. The course, intended principally for medical researchers using radioactive tracers, will be conducted by Richard Stephenson, Ph.D., associate professor at New York University, who was formerly with the physical instrumentation group at the Atomic Energy Commission's Oak Ridge (Tenn.) National Laboratory. A scintillation laboratory has been established at the college of engineering. Information can be obtained from the Graduate Office, New York University College of Engineering, New York 53.

Borden Award to Dr. Holt.—Dr. L. Emmett Holt Jr., chairman of the department of pediatrics, New York University College of Medicine, received the annual Borden Nutrition award Oct. 5 at the American Academy of Pediatrics convention in Chicago. The award, a gold medal and $1,800, was bestowed "in recognition of his many contributions, during recent years, to the field of infant nutrition and, specifically, in recognition of his careful determinations of the minimal nutrition regulations for essential amino acids and vitamins." Dr. Holt, coauthor with his father, the late L. Emmett Holt, of "The Care and Feeding of Children," is a former president of the Society for Pediatric Research and a former vice-president of the American Society for Clinical Investigation.

Services for the Cerebral Palsied.—A survey by the Coordinating Council for Cerebral Palsy in New York City, in which more than 497 voluntary and public agencies returned questionnaires, disclosed that, although there were 268 agencies with some services available to persons with cerebral palsy in New York City in 1954, only 70 agencies reported serving 10 or more such afflicted persons in that year. As an outgrowth of the survey, the Coordinating Council for Cerebral Palsy is publishing a directory of services available to persons with cerebral palsy, which will list more than 200 agencies and describe programs, admission policy, and method of referral. Services for the retarded, blind, and hard of hearing will be included as well as medical, psychological, vocational, and recreational services. The directory (cost, 50 cents) will be available at the offices of the council, 47 W. 57th St., New York 19.

Hospital News.—A grant of $250,000 has been made to Lenox Hill Hospital from the estate of Alfred H. Caspary, New York stockbroker and philanthropist. The trustees have voted to apply it toward the hospital's 10-million-dollar second-century development program, bringing the fund to $1,730,000. The hospital's development program was launched a year ago to effect a thorough modernization of Lenox Hill's square block area between Lexington and Park avenues at 76th and 77th streets. The program calls for the replacement of all the hospital's older structures with new units. The first of these is scheduled for completion in 1957, when Lenox Hill will celebrate its 100th anniversary.——Dr. George E. Armstrong, vice-chancellor for medical affairs of New York University and director of New York University-Bellevue Medical Center, and Dr. Randolph A. Wyman, medical superintendent, Bellevue Hospital Center, announce the opening of a special ward for the treatment of children with acute poliomyelitis. The new, air-conditioned unit contains treatment rooms, laboratories, and separate quarters for isolation facilities. The unit, which will be under the direction of Dr. L. Emmett Holt Jr., chairman, department of pediatrics of New York University College of Medicine, was made possible through the interest of the Sister Elizabeth Kenny Foundation and a special gift of $60,000 from the Charles A. Dana Foundation of New York. A grant-in-aid from the Sister Elizabeth Kenny Foundation will provide funds for special care and study in collaboration with the New York University Post-Graduate Medical School department of orthopedic surgery, under the chairmanship of Dr. Walter A. L. Thompson, and Dr. Marvin A. Stevens, assistant clinical professor, and the department of neurosurgery, under the chairmanship of Dr. Thomas I. Hoen. It is anticipated that, during the winter and spring months when cases of poliomyelitis are at a minimum, the facilities will be used for treatment of other contagious diseases.

OKLAHOMA

University News.—The University of Oklahoma School of Medicine, Oklahoma City, has received a two-year grant (totaling $25,148) from the National Institutes of Health to study the relationship between stressful life experiences and fat changes in the blood. The work will be conducted by Dr. Stewart G. Wolf Jr., head of the department of medicine, and Dr. James F. Hammarsten, associate professor of medicine.

Expansion of Psychiatric Facilities.—The teaching of psychiatry has been expanded at the University of Oklahoma School of Medicine, Oklahoma City, with the opening of the first 20 of 60 neuropsychiatric beds at University Hospitals and the use of 114 affiliated beds at the Oklahoma City Veterans Administration Hospital and with the appointment of two full-time associate professors of psychiatry: Dr. Donald C. Greaves and Dr. John Gussen, both formerly affiliated with the Payne-Whitney Clinic in New York City. Dr. Gussen taught at Stockholm's Karoline University Hospital before coming to Oklahoma.

PENNSYLVANIA

Prize for Pediatric Residents and Interns.—The Philadelphia Pediatric Society offers a prize of $100 for the best paper submitted by an intern or a pediatric resident at any hospital in the Philadelphia area on any subject related to pediatrics, either of clinical or of research nature. Papers should be submitted to the secretary of the society by April 1, 1956. The award will be presented at the regular meeting of the society in May, 1956.

Philadelphia

Martin Oration by Vice-Admiral McIntire.—At a dinner given by the Philadelphia Proctologic Society in the Union League Club of Philadelphia Jan. 14, 1956, the Collier Ford Martin Oration, "The White House Physician and the Crowded Years," will be presented by Vice-Admiral Ross T. McIntire, U. S. Navy, retired. Cocktails at 6:30 p. m. will precede the dinner. Reservations ($12.50 per person) may be made through Dr. George I. Israel, 255 S. 17th St., Philadelphia 3.

University News.—Academic courses leading to the degree of master of science and doctor of philosophy in the basic medical sciences have been established at Hahnemann Medical College and Hospital of Philadelphia. The program is intended for qualified college graduates who are planning a career in teaching and research. Information may be obtained from M. John Boyd, Ph.D., Chairman of the Graduate Committee, Hahnemann Medical College, 235 N. 15th St., Philadelphia 2.——At the 108th annual commencement exercises of Hahnemann Medical College and Hospital of Philadelphia, honorary degrees were presented to Dr. Frank Brown Berry, New York, Assistant Secretary of Defense, Health and Medical, who spoke on "Relationship of Behavioral Sciences to Professional Education" and was awarded the degree of doctor of laws: Dr. William Nimon Parkinson, dean, Temple University School of Medicine, who received a doctorate of humane letters; and Drs. Charles Sherwood Cameron, New York, medical director of the American Cancer Society, and Charles L. Brown, then dean, Hahnemann Medical College and Hospital of Philadelphia, who were awarded the degree of doctor of science.——Temple University School of Medicine announces the following staff appointments: Drs. Clarence R. Parker, instructor in psychiatry; Margaret N. Dealy, instructor in psychiatry; Henry Harris Perlman, assistant professor of dermatology; Charles Harris, instructor in medicine; Richard T. Ellison Jr., assistant instructor in pediatrics; Nancy N. Huang, associate in pediatrics; and Georgiana M. Peacher, Ph.D., associate professor of phoniatrics in the department of bronchoesophagology. The following faculty members have been advanced in academic rank: Drs. Robert Robbins, professor of radiology; Heath D. Bumgardner, associate in obstetrics-gynecology; Frank S. Deming, associate in obstetrics-gynecology; Arthur F. Seifer, assistant professor of orthopedics; Howard H. Steel, associate in orthopedics; Samuel L. Cresson, associate in surgery; Richard S. Oakey, associate in plastic and reconstructive surgery; Thomas C. McAuliffe, instructor in surgery; John H. Wolf, instructor in surgery; Henry Baird, associate in pediatrics; Arthur E. McElfresh, associate in pediatrics; and Stanley J. Rugel, instructor in pediatrics.

TEXAS

Cancer Fellowships and Residencies.—The University of Texas M. D. Anderson Hospital and Tumor Institute announces that facilities and equipment for therapy and research in the field of malignant diseases are provided for qualified applicants seeking training and research opportunities in oncology. Fellowships and residencies are under the auspices of the University of Texas Postgraduate School of Medicine. For information write to Dr. Grant Taylor, Office of Education, University of Texas M. D. Anderson Hospital and Tumor Institute, Texas Medical Center, Houston 25.

VIRGINIA

Award for Community Service.—At a luncheon in New York City, Nov. 17, the Virginia Council on Health and Medical Care of Richmond was announced as winner in the group division of the 1954 Lane Bryant Annual awards for community service. Two awards of $1,000 are given—one to an individual and one to a group for the most outstanding volunteer service rendered during the past year. In competition with 700 other organizations, the Virginia Council on Health and Medical Care received the award for its medical program, which informs the public of the health problems facing them, works with county groups to improve and understand existing health facilities, and sets up programs to attract young physicians to rural areas. In 1954, more than 300 physicians and 78 communities sought the council's help in "getting together," and 35 physicians moved to Virginia as a result of this service. To alleviate the shortage of doctors in rural areas, the council encouraged a program whereby interns from two teaching centers in Virginia would spend from two to three months in one of the rural hospitals. It also provided 50 medical scholarships of $1,000 a year, which stipulated that a recipient of a grant must practice in a rural area for each year he holds the scholarship. Dr. Henry B. Mulholland, Charlottesville, vice-chairman of the A. M. A. Council on Medical Service, served as the first chairman of the Virginia Council on Health and Medical Care and is now its honorary chairman.

GENERAL

Phi Lambda Kappa Convention.—For the first time the Phi Lambda Kappa Medical Fraternity will hold its annual convention in New Jersey, Dec. 29-31, at the President Hotel in Atlantic City. The fraternity, which has a membership of more than 5,000 in 22 alumni clubs and 16 active undergraduate chapters, will devote many of its sessions to projects such as student loan funds in the United States, scholarships, and textbooks for Israeli students. At the formal dinner, Dec. 30, a gold medal will be presented to a medical scientist of international renown. The social program includes a Mardi Gras dinner and dance Thursday, the annual banquet Friday, and a New Year's Eve dinner and dance Saturday.

Fellowships for Psychiatrists.—A three-year fellowship program designed for staff psychiatrists in public mental hospitals and schools for the retarded has been announced by the American Psychiatric Association and the Smith, Kline & French Foundation of Philadelphia. From 6 to 12 fellowships will be awarded under a $90,000 grant by the Smith, Kline & French Foundation. Applicants are expected to submit a "fellowship project" entailing education, training, and experience in any of a number of specialties to the fellowship committee of eight psychiatrists. Details of the fellowships may be obtained from Smith, Kline & French Fellowship Committee, American Psychiatric Association, 1785 Massachusetts Ave., N. W., Washington 6, D. C.

Cancer Research Fellowships.—The Damon Runyon Memorial fund announces current allocations of $100,950, including nine cancer research fellowships. In the nine-year history of the fund, allocations have been made through 581 grants and 328 fellowships in 203 institutions in the 48 states, the District of Columbia, and 16 foreign countries. The new grants include: $16,900 to the Michael Reese Hospital, Chicago, where Dr. Albert Tannenbaum is conducting a project for the third successive year on "Factors Controlling the Genesis of Neoplasms"; $10,000 to the University of Chicago for cancer research under the direction of Dr. Charles B. Huggins; and $14,000 to the Stanford University School of Medicine, San Francisco, for a project, "Intermediate Phases in Lymphoid Tumor Induction."

Atomic Energy Advisory Group.—The U. S. Atomic Energy Commission, Washington 25, D. C., has appointed a 12-member advisory committee of state officials to consult with the commission on regulations concerning health and safety aspects of private atomic energy activities. The committee members, who represent state agencies such as health, labor, public utility, and legal departments, include Drs. Daniel Bergsma, New Jersey commissioner of health, Trenton; Roy L. Cleere, executive director, Colorado State Department of Public Health, Denver; Irving R. Tabershaw, director, division of industrial hygiene, New York State Department of Labor, New York City; Albert E. Heustis, commissioner, department of health, Lansing, Mich.; and Arthur B. Welsh, medical coordinator for civil defense, Department of Health of Pennsylvania, Harrisburg.

Intestinal Research Institute.—The Intestinal Research Institute has been incorporated in New York state as a nonprofit educational research foundation for the study of intestinal diseases. The incorporators are Drs. Earl J. Halligan, Jersey City, N. J., Alfred J. Cantor, Flushing, N. Y., Louis Wegryn, Elizabeth, N. J., and Paul Lahvis, Gowanda, N. Y. An initial project on the possible virus etiology of ulcerative colitis is planned. A research laboratory for study of the etiology and pathogenesis of ulcerative colitis has been established at 147-41 Sanford Avenue, Flushing, N. Y., headquarters of the International Academy of Proctology. Intestinal Research Institute funds will come primarily from contributions and grants. Physicians are invited to become contributing founders. For details write to the Intestinal Research Institute, Office of the Director, 147-41 Sanford Avenue, Flushing, L. I., New York.

Fellowships in Pediatric Rehabilitation.—Dr. George G. Deaver, director, Children's Division, Institute of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center, and Mr. Leonard W. Mayo, director of the Association for the Aid of Crippled Children, jointly announce the availability of fellowships for graduate social workers in the field of pediatric rehabilitation. These fellowships provide from 6 to 12 months of planned experience that will cover all aspects of rehabilitation for physically handicapped children and adults and include direct services to the individual and his family, observation visits to appropriate community agencies, attendance at special lectures and educational institutes, and participation in staff conferences. The Children's Division uses the "Multiple Discipline Team Approach" for evaluation, program planning, and provision of services on both inpatient and outpatient basis. The fellowships ($250 a month) are open to graduates of approved schools of social work who have had a minimum of two years of paid experience in a social agency, preferably in a hospital setting. Applications may be made to Miss Florence I. Mosher, Children's Division, the Institute of Physical Medicine and Rehabilitation, 400 E. 34th St., New York 16.

Annual Crumbine Awards.—The first annual national awards in memory of Dr. Samuel J. Crumbine, established by the public health committee of the Paper Cup and Container Institute, were presented to the New York City Department of Health and the Cowlitz-Wahkiakum District Health Department of the State of Washington, Nov. 15, at the annual meeting of the American Public Health Association in Kansas City, Mo. The New York City Department of Health, under the direction of Dr. Leona Baumgartner, was honored for "outstanding achievement in the development of a comprehensive program of environmental sanitation," and the Cowlitz-Wahkiakum department, headed by Dr. Donald Champaign, Longview, Wash., for "outstanding achievement in the development of a program of eating and drinking sanitation." The winning departments each received a plaque bearing a bronze medal and an inscribed plate, and members of the departments instrumental in carrying out the winning programs received individual medals, reproducing the medal appearing on the plaque. Dr. Crumbine, who died last year at the age of 91, was instrumental in crusades against the germ-carrying roller towel, the common drinking cup, and the housefly.

Trudeau Fellowships.—The American Trudeau Society, medical section of the National Tuberculosis Association, provides a number of resident fellowships to promote the training of clinicians, medical teachers, and administrators in the field of tuberculosis and related pulmonary diseases. Awards are open to citizens of the United States for work within this country. Candidates should hold the degree of doctor of medicine. Preference will be given to those not more than 30 years of age. Awards are made for graduate study in internal medicine in an approved hospital. The American Board of Internal Medicine will accept one such year as part of the prerequisite training for certification in internal medicine and in pulmonary diseases. Applications must be received by Feb. 1. Appointments may begin on any date, and the applicant may choose the hospital in which he wishes to study.

A few fellowships at a higher level of training and award are offered to specially qualified candidates who have been assured of a continued teaching appointment on completion of training. For particulars write the Director of Medical Education, American Trudeau Society, c/o the Henry Phipps Institute, Seventh and Lombard streets, Philadelphia 47.

Genitourinary Disease Awards.—Francis Amory prizes of $3,500 each, for the discovery of measures for the relief or cure of genitourinary diseases, were awarded by the American Academy of Arts and Sciences in Boston, Oct. 5, to the following:

Frederic E. B. Foley, St. Paul, for inventive and surgical genius productive of contrivances, instruments, and operations of great value.

Choh Hao Li, Ph.D., Berkeley, Calif., for work on the relation of the anterior pituitary hormones to the functioning of the human reproductive organs.

Thaddeus R. R. Mann, Cambridge, England, for contributions in the rapidly expanding field of biochemistry of reproductive functions providing basic data stimulating research and clinical progress.

Terence J. Millin, London, England, for contribution to surgery by devising the technique of retropubic prostatectomy for benign hyperplasia of the prostate and for adapting this technique to radical prostatectomy and vesiculectomy for the cure of cancer of the prostate.

Warren O. Nelson, Ph.D., Iowa City, for studies of the structural relationships of the male sex organs and of the factors that determine the functional activities of the various components thereof.

Frederick J. Wallace, New York City, for cooperation with the urological profession in developing diagnostic and therapeutic instruments which have contributed to the technical advances in this specialty.

Lawson Wilkins, Baltimore, for his contributions to fundamental knowledge of growth and development of secondary sex characteristics in man and his brilliant application of adrenal cortical hormone to their management and treatment.

Awards in Poliomyelitis.—The National Foundation for Infantile Paralysis (120 Broadway, New York 5) has announced grants totaling $1,372,513 for professional education in selected fields. The new awards bring to a total of $21,562,456 the March of Dimes funds authorized since 1938 for the foundation's comprehensive program of professional education. In all, 5,334 scholarships and fellowships have been awarded from 1938 through Aug. 30, 1955. Of the $1,372,513 newly authorized, $681,513 was granted to medical schools, universities, hospitals, and professional associations throughout the United States, and $691,000 was appropriated for March of Dimes fellowships and scholarships. The foundation announces that 151 students were recently awarded scholarships to complete their studies in physical therapy, bringing the total number of such scholarships awarded by the foundation since 1942 to 2,365, for which almost 3 million dollars had been appropriated. The present scholarship students are residents of 34 states, the District of Columbia, and the Territory of Hawaii and are studying in 25 approved schools of physical therapy. The foundation has awarded scholarships for the current year to 56 students to complete their education in medical social work. The total number of such scholarships awarded by the foundation since 1944 is now 681, for which almost one million dollars was authorized. The present scholarship recipients are residents of 24 states and are studying in 19 of the schools of social work offering an approved curriculum in medical social work.

Albert Lasker Awards.—At its annual meeting in Kansas City, Mo., the American Public Health Association presented the 1955 Albert Lasker awards for outstanding achievement in medical research and public health administration to the following recipients:

Karl Paul Link, Ph.D., professor of biochemistry, University of Wisconsin, Madison, for "fundamental contributions to our understanding of the mechanism of blood clotting and for the development of methods for the improved treatment of thrombo-embolic conditions." Dr. Link is the discoverer of the anticoagulant, bishydroxycoumarin.

Dr. Robert D. Defries, director, the Connaught Research Laboratories, University of Toronto Faculty of Medicine, Canada, for "distinguished leadership" in the development of preventive medicine and public health in Canada. The laboratories, under Dr. Defries, prepared and supplied nearly all the virus used in the field trials of the Salk poliomyelitis vaccine in 1954.

Dr. C. Walton Lillehei, associate professor of surgery, University of Minnesota Medical School, Minneapolis, jointly with Drs. Morley Cohen, Herbert E. Warden, and Richard L. Varco, of the same institution, for "advances in cardiac surgery making possible more direct and safer approaches to the heart." Dr. Lillehei and his associates originated the "cross-circulation" surgical technique for the correction of congenital heart defects.

The Menninger Foundation and Clinic, Topeka, Kan., group award citing Drs. Karl A. and William C. Menninger for "a sustained and highly productive attack against mental diseases, bearing fruit in better hospitals, better trained staffs and greatly improved care of the patient."

The Nursing Services of the U. S. Public Health Service, Washington, D. C., group award citing the Misses Lucile Petry Leone, Pearl McIver, and Margaret Arnstein, for "distinguished contributions to the advancement and well-being of the nation" through their leadership in public health nursing.

A team of tuberculosis researchers, group award to Drs. Walsh McDermott and Carl Muschenheim, New York Hospital-Cornell Medical Center, New York, Drs. Edward H. Robitzek and Irving J. Selikoff, Sea View Hospital, Staten Island, N. Y., together with Hoffmann-La Roche Research Laboratories, Nutley, N. J., and the Squibb Institute for Medical Research, New Brunswick, N. J., for "contributions of the first order to our knowledge of the principles of the treatment and control of tuberculosis" with the isoniazid drugs.

The individual winners received prizes of $1,000, citations, and gold statuettes of the Winged Victory of Samothrace.

Course in Diabetes and Metabolic Problems.—The American Diabetes Association will offer its fourth postgraduate course in diabetes and basic metabolic problems at the Statler Hilton Hotel, Dallas, Texas, Jan. 25-27, 1956. The course will be under the directorship of Dr. Edwin L. Rippy, associate professor of clinical medicine, Southwestern Medical School of the University of Texas and Baylor University Hospital, Dallas. The fee for members of the association is $40; for nonmembers, $75. Graduate students, fellows, residents, interns, and medical students engaged in full-time study in medicine and allied sciences in the local schools and hospitals may attend without charge on presentation of a letter requesting their admission from their dean or the head of their department or service. Round-table luncheons (by subscription) will be held daily, 12:15-2:15 p. m. On Wednesday the luncheon guests will be Dr. Charles H. Best, Toronto, Canada; Dr. Arthur Grollman, Dallas, Texas; Morton F. Mason, Ph.D., Dallas, Texas; Dr. Jerome W. Conn, Ann Arbor, Mich.; and Dr. W. Stanley Hartroft, St. Louis. On Thursday a panel discussion, "Diabetes and Pregnancy," will be presented by Drs. Priscilla White, Boston; Blair Holcomb, Portland, Ore.; George M. Guest, Cincinnati; Robert L. Jackson, Columbia, Mo.; and Jules W. Vieaux, Dallas, Texas. Luncheon guests on Friday will be Dr. Best; Drs. Henry M. Winans and Everett C. Fox, Dallas, Texas; Dr. Beverly Chew Smith, New York; Dr. E. Paul Sheridan, Denver; and Dr. Garfield G. Duncan, Philadelphia. Dr. Edward L. Bortz, Philadelphia, will preside at the banquet Wednesday, 7:30 p. m. On Thursday a social hour at 6:30 p. m. will be sponsored by the Dallas Diabetes Association and Dallas Academy of Internal Medicine. Multiple informal seminars will be conducted Friday, 3:45 p. m. At 8 p. m. the Dallas Diabetes Association will present a panel, with Dr. Best, Dr. Henry T. Ricketts, Chicago, president of the national association, and Drs. Randall G. Sprague, Rochester, Minn., Alexander Marble, Boston, and Thomas P. Sharkey, Dayton, Ohio, as collaborators.

Society News.—The **American Board of Pathology** recently elected the following officers: Dr. Shields Warren, Boston, president; Dr. William B. Wartman, Chicago, vice-president; and Dr. Edward B. Smith, Indianapolis, secretary-treasurer.——The recently organized **American Society for the Aged** has established offices at 590 Fifth Ave., New York 36. Dr. Edmund V. Cowdry Jr., Washington University School of Medicine, St. Louis, is chairman of the scientific committee.——Officers of the **American Association of Medical Clinics** include: Dr. R. Franklin Jukes, Akron, Ohio, president; Dr. G. Gordon McHardy, New Orleans, vice-president and president-elect; and Dr. Harold D. Caylor, Bluffton, Ind., secretary-treasurer. The 1956 meeting will be held in Washington, D. C., Oct. 26-28.——Newly elected officers of the **Southwestern Medical Association** include: Dr. John H. Dettweiler, Albuquerque, N. Mex., president; Dr. Celso C. Stapp, El Paso, Texas, president-elect; Dr. Ernest W. Lander, Roswell, N. Mex., vice-president; and Dr. Russell L. Deter, El Paso, Texas, secretary-treasurer. The 1956 meeting will be held in Albuquerque, N. Mex.——Newly elected officers of the **Association of State and Territorial Health Officers** include: Dr. Daniel Bergsma, Trenton, N. J., president; Dr. Grady F. Mathews, Oklahoma City, vice-president; and Dr. Franklin D. Yoder, Cheyenne, Wyo., secretary-treasurer.——Newly elected officers of the **Clinical Orthopaedic Society** include: Dr. I. S. McReynolds, Houston, Texas, president; Dr. Wallace S. Duncan, Cleveland, vice-president; and Dr. Marcus J. Stewart, Memphis, Tenn., secretary-treasurer. The 1956 meeting will be held in Cleveland.——The **Central Society of Nuclear Medicine**, recently organized as a regional society to encourage and promote interest, work, and investigation in nuclear medicine, is open to physicians and other professional workers in the field. It is planned to have three meetings per year. The following officers were elected at the first meeting: Dr. Irvin F. Hummon Jr., Chicago, president, Donalee Tabern, Ph.D., North Chicago, Ill., vice-president, Dr. Ervin Kaplan, Hines, Ill., treasurer, and Robert S. Landauer, Ph.D., Chicago, secretary. All those interested are invited to contact the secretary: Robert S. Landauer, Ph.D., Radiation Center Building, 1903 W. Harrison St., Chicago 12.

CORRECTION

Intravenous Cholecystocholangiography.—In the article entitled "Intravenous Cholecystocholangiography" in The Journal, Dec. 3, 1955, page 1351, the seventh line from the top of the left-hand column should be as follows: "intradermal and intravenous sensitivity tests should be."

MEETINGS

AMERICAN MEDICAL ASSOCIATION: Dr. George F. Lull, 535 North Dearborn St., Chicago 10, Secretary.

1956 Annual Meeting, Chicago, June 11-15.

1956 Clinical Meeting, Seattle, Nov. 27-30.

1957 Annual Meeting, New York, June 3-7.

1957 Clinical Meeting, Philadelphia, Dec. 3-6.

1958 Annual Meeting, San Francisco, June 23-27.

Annual Congress on Industrial Health, Sheraton-Cadillac Hotel, Detroit, Jan. 23-24. Mr. Clark D. Bridges, 535 N. Dearborn St., Chicago 10, Acting Secretary.

Annual Congress on Medical Education and Licensure, Palmer House, Chicago, Feb. 11-14. Dr. Edward L. Turner, 535 North Dearborn St., Chicago 10, Secretary.

American Academy of Allergy, Chase Hotel, St. Louis, Feb. 6-8. Dr. Francis C. Lowell, 65 East Newton St., Boston, Secretary.

American Academy of Occupational Medicine, Netherlands-Plaza Hotel, Cincinnati, Feb. 15-17. Dr. Leonard J. Goldwater, 600 W. 168th St., New York 32, Secretary.

American Academy of Orthopaedic Surgeons, Palmer House, Chicago, Jan. 28-Feb. 2. Dr. John R. Norcross, 122 South Michigan Blvd., Chicago 3, Secretary.

American College of Radiology, Drake Hotel, Chicago, Feb. 10-11. Mr. William C. Stronach, 20 North Wacker Drive, Chicago 6, Executive Secretary.

American Society for Surgery of the Hand, Chicago, Jan. 27. Dr. George V. Webster, 1145 East Green St., Pasadena 1, Calif., Secretary.

Eastern Section, American Laryngological, Rhinological and Otological Society, Boston, Jan. 13. Dr. John A. Murtagh, Dartmouth College, Hanover, N. H., Vice President.

Los Angeles Midwinter Medical Convention, Biltmore Hotel, Los Angeles, Jan. 3-5. Dr. Paul D. Foster, 1925 Wilshire Blvd., Los Angeles 58, General Chairman.

Medical Society Executives Conference, Drake Hotel, Chicago, Feb. 6-8. Mr. H. Martin Baker, 1102 South Hillside, Wichita 17, Kansas, Secretary.

Middle Section, American Laryngological, Rhinological and Otological Society, Netherland Plaza, Cincinnati, Jan. 16. Dr. William H. Craddock, 2328 Auburn Ave., Cincinnati 19, Vice President.

Neurosurgical Society of America, Hotel Key Biscayne, Key Biscayne, Miami, Fla., Jan. 18-21. Dr. Lester A. Mount, 700 West 168th St., *New York 32, Secretary.*

Northwest Society for Clinical Research, University of Oregon Medical School, Portland, Ore., Jan 21. Dr. Arthur L. Rogers, 1216 S.W. Yamhill St., Portland 5, Ore., Secretary.

Regional Meetings, American College of Physicians:

Shreveport, La., Jan. 14. Dr. M. D. Hargrove, 803 Jordan St., Shreveport, La., Governor.

Philadelphia, Jan. 20. Dr. Thomas M. McMillan, 330 South 9th St., Philadelphia 7, Governor.

Saskatoon, Sask., Feb. 3-4. Dr. C. H. A. Walton, Winnipeg Clinic, Winnipeg, Man., Canada, Governor.

Tucson, Ariz., Feb. 11. Dr. Leslie R. Kober, 15 East Monroe St., Phoenix, Ariz., Governor.

Sectional Meetings, American College of Surgeons:

Jacksonville, Fla., Hotel George Washington, Jan. 16-18. Dr. Kenneth A. Morris, 2522 Oak St., Jacksonville 4, Fla., Chairman.

Philadelphia, The Bellevue-Stratford, Feb. 13-16. Dr. Calvin M. Smyth Jr., Abington Memorial Hospital, Abington, Pa., Chairman.

Society of University Surgeons, Hotel Claypool, Indianapolis, Feb. 8-10. Dr. C. Rollins Hanlon, 1325 South Grand Blvd., St. Louis 4, Secretary.

South Atlantic Association of Obstetricians and Gynecologists, Hollywood Beach Hotel, Hollywood, Fla., Jan. 28-Feb. 1. Dr. C. H. Mauzy, Bowman Gray School of Medicine, Winston-Salem, N. C., Secretary.

Southern Section, American Federation for Clinical Research, Jung Hotel, New Orleans, Jan. 20. Dr. John H. Moyer, 1200 M.D. Anderson Blvd., Houston, Texas, Secretary.

Southern Section, American Laryngological, Rhinological and Otological Society, The Shamrock, Houston, Texas, Jan. 27-28. Dr. J. M. Robison, 1304 Walker Ave., Houston 2, Texas, Chairman.

U. S. Section, International College of Surgeons, Regional Meeting, Greenbrier Hotel, White Sulphur Springs, W. Va., Feb. 12-15. Dr. E. G. Gill, 711 South Jefferson St., Roanoke, Va., Chairman.

Western Section, American Federation for Clinical Research, Golden Bough Theater, Carmel, Calif., Jan. 26. Dr. Charles M. Grossman, 301 Selling Bldg., Portland 5, Ore., Secretary.

Western Section, American Laryngological, Rhinological and Otological Society, County Medical Society Bldg., San Francisco, Jan. 21. Dr. David D. DeWeese, 1216 S. W. Yamhill St., Portland, Ore., Vice President.

Western Society for Clinical Research, Carmel-by-the-Sea, Calif., Jan. 27-28. Dr. Arthur J. Seaman, University of Oregon Medical School, Portland 1, Ore., Secretary.

FOREIGN AND INTERNATIONAL

All India Medical Conference, Jaipur, India, Dec. 26-28. Dr. B. N. Consul, Association Bldg., S.M.S. Hospital Premises, Jaipur, India, Organizing Secretary.

Canadian Medical Association, Quebec, P. Q., Canada, June 10-14, 1956. Dr. Arthur D. Kelly, 150 St. George St., Toronto 5, Ont., Canada, Secretary.

Conference of International Union for Health Education of the Public, Rome, Italy, April 27-May 5, 1956. Mr. Lucien Viborel, 92 rue St. Denis, Paris 1er, France, Secretary-General.

Congress of International Anesthesia Research Society, Miami Beach, Fla., U.S.A., April 9-12, 1956. For information write: Dr. R. J. Whitacre, 13951 Terrace Road, Cleveland 12, Ohio, U. S. A.

Congress of International Association of Limnology, Helsinki, Finland, July 26-Aug. 7, 1956. For information address: Dr. H. Luther, *Snellmansgatan 16 C 36, Helsinki, Finland.*

Congress of International Association of Logopedics and Phoniatrics, Barcelona, Spain, Sept. 3-7, 1956. Dr. J. Perello, Provenza 319, Barcelona 9, Spain, Secretary-General.

Congress of International Society of Hematology, Hotel Somerset, Boston, Mass., U.S.A., Aug. 27-Sept. 1, 1956. Dr. W. C. Moloney, 39 Bay State Road, Boston, Mass., U.S.A., Secretary.

Congress of Latin Society of Ophthalmology, Madrid, Spain, April 24-28, 1956. For information address: Dr. Costi, Montalban 3, Madrid, Spain.

European Congress of Allergology, Florence, Italy, Sept. 12-15, 1956. Prof. Umberto Serafini, Instituto de Patologia Medica, Viale Morgagni, Florence, Italy, Secretary-General.

European Congress of Cardiology, Stockholm, Sweden, Sept. 10-14, 1956. Dr. Karl Erik Grewin, Sodersjukhuset, Stockholm, Sweden, General Secretary.

European Symposium on Vitamin B_{12}, Hamburg, Germany, May, 1956. For information write: Doz. Dr. H. Bauer, Nervenklinik, Hamburg-Eppendorf, Germany.

Health Congress, Royal Society for the Promotion of Health, Blackpool, England, April 24-27, 1956. Mr. P. Arthur Wells, 90 Buckingham Palace Road, London S.W. 1, England, Secretary.

Inter-American Congress of Cardiology, Havana, Cuba, Nov. 4-10, 1956. For information address: Dr. Ramon Aixala, Apartado 2108, Havana, Cuba.

International Academy of Pathology, Cincinnati, Ohio, U. S. A., April 24-25, 1956. Dr. F. K. Mostofi, Armed Forces Institute of Pathology, Washington 25, D. C., U. S. A., Secretary.

International Congress Against Alcoholism, Istanbul, Turkey, Sept. 10-15, 1956. For information address: International contre l'Alcoolisme, Case Gare 49, Lausanne, Switzerland.

International Congress on Animal Reproduction, Arts School, University of Cambridge, Cambridge, England, June 25-30, 1956. Dr. Joseph Edwards, Production Division, Milk Marketing Board, Thames Ditton, Surrey, England, Hon. Secretary.

International Congress of Anthropological and Ethnological Sciences, Philadelphia, Pa., U. S. A., Sept. 2-9, 1956. Dr. William N. Fenton, National Research Council, Division of Anthropology and Psychology, 2101 Constitution Avenue, Washington 25, D. C., U. S. A., Secretary-General.

International Congress of Dietetics, Congress Palace, Esposizione Universale Roma, Rome, Italy, Sept. 10-14, 1956. Prof. E. Serianni, Associazione Dietetica, Italiana, via dei Penitenzieri N. 13, Rome, Italy, Secretary General.

International Congress on Diseases of the Chest, Cologne, Germany, Aug. 19-23, 1956. Mr. Murray Kornfeld, 112 East Chestnut St., Chicago 11, Illinois, U. S. A., Executive Director.

International Congress of Entomology, Montreal, Canada, Aug. 17-25, 1956. Mr. J. A. Downes, Science Service Bldg., Carling Ave., Ottawa, Ont., Canada, Secretary.

International Congress of Gastroenterology, London, England, July 18-21, 1956. Mr. Hermon Taylor, London Hospital, White Chapel, London E.1, England, Honorable Secretary.

International Congress for the History of Science, Florence and Milan, Italy, Sept. 3-10, 1956. Dr. M. L. Bonelli, Instituto di Ottica, Arcetri, Florence, Italy, Secretary-General.

International Congress of Human Genetics, Copenhagen, Denmark, Aug. 1-6, 1956. For information address: The University Institute for *Human Genetics, Tagensvej 14, Copenhagen N, Denmark.*

International Congress of Hydatid Disease, Athens, Greece, Sept. 14-18, 1956. Prof. B. Kourias, Croix-Rouge Hellenique, 1 rue Mackenzie King, Athens, Greece, Secretary-General.

International Congress of Internal Medicine, Madrid, Spain, Sept. 19-23, 1956. Dr. J. C. De Oya and Dr. J. Gimena, Hostaleza No. 90, Madrid, Spain, Secretaries.

International Congress of International College of Surgeons, Palmer House, Chicago, Illinois, U. S. A., Sept. 9-13, 1956. Dr. Max Thorek, 1516 Lake Shore Drive, Chicago, Illinois, U. S. A., Secretary-General.

International Congress of Neo-Hippocratic Medicine, Montecatini Terme, Italy, May 20-22, 1956. Dr. Valente, 41 Avenue Verdi, Montecatini Terme, Italy, Secretary-General.

International Congress of Paediatrics, Copenhagen, Denmark, July 22-27, 1956. Professor P. Plum, Rigshospitalet, Copenhagen, Denmark, *President.*

International Congress of Physical Medicine, Copenhagen, Denmark, August 20-24, 1956. Dr. B. Strandberg, Kobenhavns amts sygehus i Gentofte, Dept. of Rheumatology and Physical Medicine, Hellerup, Denmark, Honorable Secretary.

International Congress of Radiology, Mexico, D. F., Mexico, July 22-28, 1956. Dr. Jose Noriega, Tepic 126 (2e piso), Mexico, D. F. 7, Mexico, Secretary General.

International Congress of World Confederation for Physical Therapy, Hotel Statler, New York, New York, U. S. A., June 17-23, 1956. For information address: Miss Mildred Elson, American Physical Therapy Association, 1790 Broadway, New York 19, New York, U. S. A.

International Genetics Symposium, Tokyo and Kyoto, Japan, Sept. 6-12, 1956. For information address: Secretary, International Genetics Symposium, Science Council of Japan, Ueno Park, Tokyo, Japan.

International Physiological Congress, Brussels, Belgium, July 29-Aug. 5, 1956. For information address: Prof. J. Reuse, Faculte de Medicine et de Pharmacie, 115 Boulevard de Waterloo, Brussels, Belgium.

International Professional Union of Gynecologists and Obstetricians, Madrid, Spain, Sept. 28-29, 1956. Dr. Jacques Courtois, 1 rue Racine, St-Germain-en-Laye (S and O), France, Permanent International Secretary-General.

Latin American Congress of Physical Medicine, San Juan, Puerto Rico and Curacao, N.W.I., Jan. 29-Feb. 8, 1956. Dr. Cassius Lopez de Victoria, 176 East 71st St., New York 21, New York, U. S. A., Executive Director.

Medical Women's International Association, Extraordinary General Assembly, Burgenstock, Nidwalden, Switzerland, Sept. 21-23, 1956. Dr. Janet Aitken, 30a Acacia Road, London N.W. 1, England, Secretary.

Middle East Medical Assembly, Campus, American University of Beirut, Beirut, Lebanon, April 7-9, 1956. Dr. Virgil C. Scott, American University of Beirut, Beirut, Lebanon, Chairman.

National Congress of Pediatrics, Cuidad Universitaria, Mexico D.F., Mexico, May 1-5, 1956. Dr. Ignacio Avila Cisneros, Calzada de Madereros No. 240, Mexico 18, D.F., Mexico, Coordinator.

North Queensland Medical Conference, Cairns, North Queensland, Australia, June 25-30, 1956. Dr. W. R. Horsfall, P. O Box 672, Cairns, N.Q., Australia, Secretary.

Pan-American Academy of General Practice, San Juan, Puerto Rico and Curacao, N.W.I., Jan. 29-Feb. 8, 1956. Dr. Arturo Martinez, 54 East 72d St., New York 21, New York, U. S. A., Secretary.

Pan American Congress of Gastroenterology, Havana, Cuba, Jan. 20-27, 1956. For information address: Dr. Norberto M. Stapler, 1267 J. E. Uriburu, Buenos Aires, Argentine, S. A.

Pan American Congress of Ophthalmology, Santiago, Chile, S. A., Jan. 9-14, 1956. Dr. Rene Contardo, Huerfanos 930, Of. 74, Santiago, Chile, Secretary General.

Pan American Congress of Otorhinolaryngology and Bronchoesophagology, San Juan, Puerto Rico, April 8-12, 1956. Dr. C. E. Munoz MacCormick, Apartado 9111, Santurce 29, Puerto Rico, Secretary General.

Pan American Medical Women's Alliance, Santiago, Chile, March 6-13, 1956. For information address: Dr. Eva Cutright, 458 Beall Ave., Wooster, Ohio, U. S. A.

World Congress on Fertility and Sterility, Naples, Italy, May 18-26, 1956. Dr. Maxwell Roland, 114-20 Queens Boulevard, Forest Hills 75, New York, N. Y., U. S. A., Chairman, Liaison Committee.

World Medical Association, Havana, Cuba, Oct. 9-15, 1956. Dr. Louis H. Bauer, 345 East 46th St., New York 17, New York, U. S. A., Secretary-General.

EXAMINATIONS AND LICENSURE

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology: *Written.* Various locations in the United States and Canada, July 20. Final date for filing application is Jan. 20. *Oral.* Miami Beach, Mar. 18-22. Sec., Dr. C. B. Hickcox, 80 Seymour St., Hartford 15, Conn.

American Board of Dermatology and Syphilology. *Written.* Various centers, July 26. *Oral.* St. Louis, Oct. 12-15. Final date for filing applications is April 1. Sec., Dr. B. M. Kesten, One Haven Ave., New York 32.

American Board of Internal Medicine: *Written.* Oct. 15, 1956. Final date for filing application is May 1. *Oral Examinations in 1956.* New Orleans, Feb. 7-10; Los Angeles, April 12-14; Chicago, June 7-9. Final date for filing application for these three oral examinations is Jan. 3. New York City, Sept. 21-25. Final date for filing application is April 1. Exec. Sec., Dr. William A. Werrell, 1 West Main St., Madison 3, Wis.

American Board of Obstetrics and Gynecology: *Written Examination and submission of Case Reports. Part I.* Various locations in United States and Canada, and military centers outside of the Continental United States, Feb. 3, 1956. Final date for filing application was Oct. 1. *Oral and Pathological Examinations. Part II.* Chicago, May 11-20, 1956. Dr. Robert L. Faulkner, 2105 Adelbert Road, Cleveland 6.

American Board of Ophthalmology: *Written.* January 24-26, 1956. *Practical Examination.* San Francisco, June 18-21, St. Louis, Oct. 20-25. Applications for 1957 written examination must be filed before July 1, 1956. Sec., Dr. Merrill J. King, Box 236, Cape Cottage Branch, Portland 9, Maine.

American Board of Orthopaedic Surgery: *Oral.* Jan. 26-27. Final date for filing application was Aug. 15. *Part I. Oral and written.* Various centers, April, 1956. Final date for filing application was Nov. 30. Sec., Dr. Harold A. Sofield, 116 South Michigan Ave., Chicago 3.

American Board of Otolaryngology. *Oral.* Montreal, Canada, May 6-10. Sec., Dr. Dean M. Lierle, University Hospitals, Iowa City.

American Board of Physical Medicine and Rehabilitation. *Parts I and II.* Chicago, June 16-17. Sec., Dr. Earl C. Elkins, 200 First St., S. W., Rochester, Minn.

American Board of Plastic Surgery. *Entire Examination.* Buffalo, May 13-15. Final date for filing case reports is Jan. 1. Corres. Sec., Mrs. Estelle E. Hillerich, 4647 Pershing Ave., St. Louis 8.

American Board of Psychiatry and Neurology: New York City, December, Philadelphia, April 16-18, 1956. Sec., Dr. David A. Boyd, 102-110 Second Ave. S.W., Rochester, Minn.

American Board of Radiology: Atlanta, Ga., Mar. 6-10. Final date for filing application was Dec. 1.; Chicago, June 5-9. Final date for filing applications is Jan. 1.; Los Angeles, Sept. 30-Oct. 4. Final date for filing applications is June 1. Sec., Dr. B. R. Kirklin, Kahler Hotel Bldg., Rochester, Minn.

American Board of Surgery: *Part I.* Centers throughout the United States, in Europe and in the Far East, March 28. Closing date for the March examination was December 1. *Part II.* St. Louis, Dec. 12-13; New Orleans, Jan 16-17; Los Angeles, Feb. 13-14; San Francisco, Feb. 16-17; Durham, March 12-13; Boston, May 14-15 and Philadelphia, June 4-5. Sec., Dr. John B. Flick, 255 S. Fifteenth St., Philadelphia 2.

Board of Thoracic Surgery. *Written.* February 1956. Closing date for filing application was Dec. 1. Sec., Dr. William M. Tuttle, 1151 Taylor Ave., Detroit 2, Mich.

MAGAZINE–TELEVISION REPORT

The following list of current medical articles in mass-circulation magazines and forthcoming network television programs on medical subjects is published each week only for the information of readers of The Journal. *Unless specifically stated, the American Medical Association neither approves nor disapproves of the articles and programs reported.*

TELEVISION

Monday, Dec. 26

ABC-TV, 8 p. m. EST. "TV Reader's Digest" offers a drama based on the experiences of passengers aboard a snowbound train in Donner Pass on Jan. 13, 1952.

Monday, Jan. 2

NBC-TV, 11 a. m.-noon. "Home" presents Howard Whitman's "News of Medicine and Health."

NBC-TV, 9 p. m. EST. "Medic" pays tribute to anesthesiologists in a teleplay titled "A Time for Sleep."

ABC-TV, 9:30 p. m. EST. "Medical Horizons" takes its remote unit to Jersey City Medical Center for a report on research into diseases of the liver. Produced in cooperation with the American Medical Association.

MAGAZINES

Look, Dec. 27, 1955

"The Education of Dr. Fuchs"

Picture story of a Viennese woman doctor who is completing her internship at Manhattan's Beth David Hospital, in New York.

"Crisis," by Fletcher Knebel

A detailed account of the first hours after President Eisenhower's heart attack, including the medical attention given to the President and the shock in administrative circles caused by the news of his illness.

Redbook, January, 1956

"What Your Doctor Should Charge"

Using what the magazine calls "the first reliable figures on medical fees in all sections of the country," this article lists fees for 10 operative procedures and home and office calls as charged in 11 large cities across the country. Purpose of the article, according to the concluding paragraph, is to serve as "a challenge to both the medical profession and the people it serves to go further in eliminating one of the most important sources of friction and misunderstanding between physicians and patients," the "mystery" about the fees doctors charge for routine cases.

"How to Stay Healthy This Winter," by Alton L. Blakeslee

The author points out that the human body is under a greater strain in winter than at any other time of the year and lists "precautions" recommended by medical authorities to guard against added wintertime health hazards.

Coronet, January, 1956

"The Miracle of Face Planing," by Marian and Harold Wolfson

Dermatologists are using dermabrasion (facial planing with a rotating wire brush) for rhinophyma and to remove acne scars, moles, wrinkles, and freckles.

"It's Croup—Be Careful," by Ralph Bass

A general discussion of the symptoms of croup, with advice on home treatment.

"Food After 40," by Bruce Bliven

Experts in the field of nutrition "believe that if we ate proper foods, in proper amounts, all through our lives, we would live substantially longer and be much healthier than we are now." The author says that older people need fewer calories and should take special care in planning their diets.

Ladies' Home Journal, January, 1956

"Understanding Childhood Nephrosis," by Peter Briggs

In a short feature, the author discusses nephrosis in children and points out that neither the cause nor a cure is known.

DEATHS

Williams, Horatio Burt, Greenwich, Conn.; born in Utica, N. Y., Sept. 17, 1877; Syracuse University College of Medicine, 1905; a registered engineer; assistant in physiology at Cornell University Medical School, New York City, from 1907 to 1911; since 1942 Dalton professor emeritus of physiology at Columbia University College of Physicians and Surgeons, New York City, where he joined the faculty as an associate in physiology, later became assistant professor, Dalton professor, and for many years executive officer of the department; an associate member of the American Medical Association and for many years member of its Council on Physical Therapy; member of the Medical Society of the State of New York, American Society of Anesthesiologists, Inc., National Committee on Radiation Protection, American Physiological Society, American Physical Society, Physical Society of London, Optical Society of America, Acoustical Society of America, New York Academy of Medicine, Society of American Military Engineers, American Institute of Electrical Engineers, National Society of Professional Engineers, Connecticut Society of Professional Engineers, Society of Experimental Biology and Medicine, Saint Nicholas Society of New York, Psi Upsilon, Nu Sigma Nu, and Alpha Omega Alpha; past-president and vice-president of the Columbia chapter of Sigma Xi; member of the committee on safety of the American Institute of Electrical Engineering; served as a captain in the Corps of Engineers of the U. S. Army from 1917 to 1919, when he became instructor in the Engineering School; captain in the Engineers Reserve Corps from 1919 to 1939; consultant at Greenwich (Conn.) Hospital and the Columbia Presbyterian Medical Center; director and technical adviser, Cambridge Instrument Company; died in the Harkness Pavilion of Columbia Presbyterian Medical Center in New York City Nov. 1, aged 78.

Fry, Clements Collard ⊕ New Haven, Conn.; born in Jersey City, N. J., Nov. 15, 1892; Northwestern University Medical School, Chicago, 1924; interned at the Louisville (Ky.) City Hospital; formerly a resident physician at the Boston Psychopathic Hospital; in 1925 assistant in psychiatry at the Harvard Medical School in Boston; later joined the faculty of Yale University School of Medicine, where he was lecturer in psychiatry and psychiatrist-in-chief in the department of university health; during World War II served for seven months with the Lend-Lease Administration in Washington, and later served also with the National Research Council and the department of the Army as an adviser on public health, nutrition, and medical supplies, in the planning, research, and special problems divisions of these agencies; in June, Michigan State College, East Lansing, celebrating its centennial, honored him with a centennial award for "outstanding contributions to society and for achieving distinction in endeavors, and for setting the highest standards of accomplishment"; in the fall of this year he received the first citation ever awarded by the Connecticut Association for Mental Hygiene for his long and distinguished service; visiting psychiatrist at Wesleyan (Conn.) University from 1927 to 1932; served as a trustee of the Fairfield (Conn.) State Hospital; associate psychiatrist at the Grace-New Haven Community Hospital university service; co-author, with Edna G. Rostow, of "Mental Health in College" and of "The Anatomy of Personality" with Dr. Howard W. Haggard; died in the Gaylord Farms Sanatorium, Wallingford, Nov. 27, aged 63.

Wilson, Fred Bailey ⊕ Beaver, Pa.; born in Beaver Nov. 16, 1879; University of Pennsylvania Department of Medicine, Philadelphia, 1905; past-president of the Beaver County Medical Society; for many years president of the Beaver County Tuberculosis Association; for 25 years on the executive committee of the state tuberculosis association; fellow of the American College of Physicians; member of the founders group of the American Board of Internal Medicine; served during World War I; largely responsible for the establishment of the Beaver County Sanatorium in Monaca, where he was first medical director, and at the time of his death consulting director; on the medical staff of Providence Hospital in Beaver Falls, Rochester (Pa.) General Hospital, where he was chief of staff for many years, and the Beaver Valley General Hospital in New Brighton, Pa.; died in the Cleveland (Ohio) Clinic Hospital Aug. 18, aged 75, of a ruptured arteriosclerotic aneurysm of the abdominal aorta.

Blair, Arless Arland ⊕ Fort Smith, Ark.; born in Scranton Aug. 21, 1891; University of Tennessee College of Medicine, Memphis, 1916; associate clinical professor of medicine at the University of Arkansas School of Medicine, Little Rock; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians, of which he was governor; past-president of the Sebastian County Medical Society and the Sebastian County Tuberculosis Association; for many years a member of the school board; served during World War I; consultant on internal medicine, Veterans Administration Hospital in Fayetteville; affiliated with St. Edward's Mercy Hospital, where he was formerly chief of staff; on the staffs of the Crawford County Hospital at Van Buren and the Sparks Memorial Hospital; a director of the Superior Savings and Loan Company; died Oct. 24, aged 64.

Wolfer, John Adams ⊕ Banning, Calif.; born in Decatur, Ill., Dec. 7, 1880; Northwestern University Medical School, Chicago, 1908; professor of surgery emeritus at his alma mater, where he served as director of the tumor clinic; member of the founders group of the American Board of Surgery; member of the American Surgical Association; past-president of the Chicago Surgical Society; fellow of the American College of Surgeons; in 1950 was awarded the honor medallion of the Illinois Division of the American Cancer Society for outstanding work in cancer control; formerly chairman of the cancer committee of the Illinois State Medical Society; past-president of the Northwestern University Medical School Alumni Association; served on the staffs of the Passavant Memorial, Wesley Memorial, and Cook County hospitals in Chicago; died Nov. 21, aged 74.

Ramsey, Wayne Stevenson, Shreveport, La.; Harvard Medical School, Boston, 1912; member of the Ohio State Medical Association; served as president of the Washtenaw County (Mich.) Medical Society and as secretary of the Michigan Crippled Children Commission; at one time health commissioner of Greenville, Ohio, and Darke County; in 1944 appointed health officer of Deschutes County with headquarters in Bend; formerly associated with the U. S. Public Health Service; died in the Willis Knighton Clinic and Hospital Nov. 16, aged 69, of hypertensive cardiovascular disease, cerebral thrombosis, and arteriosclerosis.

Presson, Virgil Guy ⊕ Tucson, Ariz.; University of Oklahoma School of Medicine, Oklahoma City, 1923; fellow of the American College of Physicians; past-president of the Pima County Medical Society and past vice-president of the Arizona State Medical Association; served overseas during World War I; at one time practiced in Santa Ana, Calif., where he was health officer of Orange County; on the staffs of the Pima County General Hospital, Tucson Medical Center, and the St. Mary's Hospital and Sanatorium, where he died Oct. 2, aged 59, of acute pancreatitis.

Alava, Petronio ⊕ Wilmington, Del.; Washington University School of Medicine, St. Louis, 1923; interned at St. Alexis Hospital in Cleveland; fellow of the International College of Surgeons; chief of surgery at St. Francis Hospital, where he served a residency; died Oct. 11, aged 56, of acute coronary thrombosis.

Bailey, William James, Fort Lauderdale, Fla.; University of Pennsylvania Department of Medicine, Philadelphia, 1895; fellow of the American College of Surgeons; died in the Broward General Hospital Sept. 28, aged 82, of arteriosclerotic heart disease, bronchopneumonia, and cerebral thrombosis.

⊕ Indicates Member of the American Medical Association.

FOREIGN LETTERS

BELGIUM

Privileged Communication.—At the Belgo-Luxemburgian Union of Penal Law the moral and social value of keeping professional secrets was recognized, but it was stated that present legislation based on modern sociology sometimes requires exceptions to this principle in the interests of society. In the matter of judicial inquiries, such as inquests and investigations, some maintain that the physician is bound to hold secret only that which is revealed to him directly by the patient and not information he may have acquired from other sources, or from his examinations. If the patient is a minor the jurists believe that the parents have the right to know everything from the physician. There was some disagreement concerning the seizure of medical documents by those legally in authority. The purpose of such papers is to help the physician's memory and as such cannot be taken if the physician is a testifying witness; they can be taken only if he himself is incriminated. The president of the meeting proposed that as a criterion for divulging professional secrets the physician should let his conscience be his guide.

CANADA

Alberta Medical Insurance Plan.—In 1935 the province of Alberta passed a health insurance act that was never put into effect and was repealed in 1953. At this time another act to provide for hospitalization and treatment services was passed. The act permits the government to take care of costs of medical care of Alberta residents receiving certain forms of assistance or allowances under other provincial acts. Last spring, a section of the 1953 act permitting payment of a subsidy to insurance organizations providing cover of hospitalization costs was amended. The amendment allows the Minister of Health to enter into agreement with Medical Services (Alberta), Inc., or any insurance organization, company, or society to pay a subsidy not exceeding one-third of the cost of a policy or insurance scheme covering medical, surgical, or obstetric services, provided the cost to the consumer is correspondingly lowered. The interesting feature is that specific reference is made to Medical Services (Alberta), Inc., a prepaid medical plan sponsored by the College of Physicians and Surgeons of the province that presently provides comprehensive coverage for over 100,000 persons. Members choose their own physician, who is paid in accordance with a scale of fees set by the college. Specialist fees are met to a certain extent. The policy is sold basically to groups, members of which are accepted without waiting periods or exclusions. An individual contract is available at a higher rate and with certain waiting periods, but at present this arrangement involves only 5% of the contracts.

It would seem that the government of Alberta regards the physician-sponsored Medical Services, Inc., scheme as a suitable basis for building up a comprehensive province-wide health insurance program with which commercial insurance organizations would have difficulty in competing. The suggestion has been made that the payment of a government subsidy of one-third of the premium would raise the proportion of the population covered for medical care (excluding hospitalization costs that are dealt with by other legislation) from its present figure of 20% to 75%. Although there is some suspicion of offers of government subsidy, in the belief that he who pays the piper will in the end call the tune, the plan has been received favorably by the Alberta medical profession. Their representatives, who should be in the best position to judge, have indicated their willingness to have the plan commence at an early date. Indeed the delay in starting the plan, originally timed for April, 1955, has not been due to any organized medical opposition. On the face of it, the program has the merits of not being compulsory, of making the public pay a substantial share of the cost directly to Medical Services, Inc., and of interfering as little as possible with the doctor-patient relationship.

Traffic in Narcotics.—Last spring a committee of 23 senators was appointed to study the traffic in narcotics. They found that about half the illicit drug traffic in Canada is centered in British Columbia. They estimate that there are about 3,000 drug addicts in Canada, of whom they class 2,300 as criminal addicts. Fortunately, however, there is no teen-age or juvenile addiction problem. Heroin is the commonest drug of addiction, marihuana being rarely used. There had been some talk of establishing narcotics clinics where addicts might legally obtain drugs, but the committee condemns this procedure. It recommends educational programs for adult groups but discourages any activity that might arouse undue curiosity on the part of juveniles or other impressionable persons. It advises greater attention to mental health programs in schools, in the hope of averting situations leading to addiction. It commends the narcotics research in progress in Canada, going so far as to suggest that this country could be a mecca for other research workers. It also praised the administration of the Opium and Narcotics Drug Act by the Division of Narcotic Control in Ottawa. The committee was disturbed at the lack of facilities available in Canada for the treatment of addicts or for their follow-up and urged the immediate provision of such facilities. It wished to see penalties for trafficking stiffened, whether the trafficker is an addict or not. It also proposed stern measures for the addict found in association with juveniles. Although Canada's narcotics problem is relatively small, it requires firm handling now, lest it get out of hand.

ENGLAND

Cost of Prescription.—Addressing a meeting of the Essex branch of the British Medical Association in September, Dr. D. P. Stevenson, deputy secretary of the British Medical Association, said that the amount of medicine prescribed under the National Health Service was being criticized. Although last year the cost of these drugs was almost as much as the cost of the family physician service, he believes that to charge the medical profession with overprescribing is unfair. Physicians are subject to severe disciplinary action for overprescribing, but despite this provision the number of cases in which penalties have been inflicted against physicians has been negligible. Most physicians prescribe only such drugs, in such amounts, as they think their patients need. A physician's primary duty is to his patient, and the factor of cost should not deter him from doing his duty. This was the primary reason for establishing the National Health Service. The critics forget that the cost of drugs has shared in the general inflation. Furthermore, the cost of some of the most effective modern drugs is very high, but, if prescribing such drugs enables an illness to be treated at home and prevents one more patient's being sent to the hospital, a financial saving is gained. The average age of the population is rising, and older people require more frequent treatment and prescribing of medicine than younger persons. It should be remembered that many persons believe that the regular consumption of certain drugs is necessary for their well-being. It would be difficult for physicians to combat this attitude, for the psychological benefits of drugs are now well rooted in the public mind. The critics of the general practitioner ought, in fairness, to put the cost of prescribing against the background of National Health Service costs as a whole, especially the heavy costs of the hospital service.

Hospitals Contributory Schemes.—At the Annual Meeting of the British Hospitals Contributory Schemes Association in September, the Minister of Health showed that, in spite of the welfare state, voluntary contributions to hospitals are necessary. About 3,750,000 contributors are enrolled in these schemes, and,

---

The items in these letters are contributed by regular correspondents in the various foreign countries.

if dependents are counted, the population so covered must number more than 10 million. The individual hospital schemes aim at having as their reserve fund an amount equal to at least one year's operating expense, to cover such emergencies as an influenza epidemic. Fifteen schemes have reached or passed that target, and two-thirds of the schemes provide for reserves equal to over 75% of one year's budget, which is a tribute to the strength of the movement. The minister believes that the state should not try to run a social service wholly by itself. The association, in collaboration with the Red Cross and the Women's Voluntary Services, helps to bring the hospitals nearer to the community. There are 1,400 hospitals that have their own League of Friends or similar organization, but about 1,000 have no such attachment.

Alcoholism.—An editorial in the *Guy's Hospital Gazette* issue of June 26, 1955, says that at the casualty department of all hospitals a great deal of medical care, nursing time, and the country's money is spent on the care of the drunk and comatose and the drunk and injured patient. An instance was cited in which one drunken man required the consecutive services of two policemen, two ambulance attendants, one emergency room porter, two nurses, two dressers, one night assistant house surgeon, one receiving-room house physician, one receiving-room house surgeon, one radiographer, and the nursing staff of the ward to which he was assigned overnight. In addition, there was the cost of the x-ray films, dressings, suture materials, and board and lodging. Since this sort of thing goes on in every hospital in the country, the hospital service must spend an appreciable amount of money in this way every year. The editorial urges that an appropriate charge be made in such cases.

New Antibiotics Plant.—A 7 million dollar factory that will save Great Britain $5,600,000 a year was opened by Lord Brabazon and is producing oxytetracycline and tetracycline. Both these drugs were formerly imported from the United States. It is estimated that by supplementing hog feeds with oxytetracycline, farmers can save 14 million dollars a year and 300,000 acres of land can be freed for crop cultivation. Oxytetracycline is beneficial to laying hens and is valuable in the treatment of many animal and plant diseases. The drugs produced by the new factory will be exported to other sterling area countries.

Children Act of 1948.—The Conservative Party Conference, meeting at Bournemouth, urged the government to consider the desirability of amending the Children Act of 1948 and to make it clear beyond doubt that the first duty of local authorities is to keep children within the family and only as a last resort to take them into protective custody. Local authorities should be required to appoint welfare officers to undertake preventive work with problem families and, within limits, be permitted to provide for necessary material needs out of public funds.

ISRAEL

Demographic Problems of Israel.—At the third World Assembly of the Israel Medical Association in August, Prof. R. Baki, director, Central Bureau of Statistics, reported that the recent migratory movement appears to be transient. Emigration is mainly a side-effect of the mass immigration of the period 1948 to 1951. Since 1952 it has been decreasing, and there are signs that a new wave of immigration is on the way. The mass immigration has, however, led to the depletion of the main reservoirs of the Jewish population of four of the five regions, from which until now immigrants have reached Israel in large numbers. In consequence thereof, increased immigration may be expected in the future only if a real change occurs in the attitude towards immigration among the Jews living in America, Western and Northern Europe, South Africa, and Oceania. Immigration from these regions is rather meager. In view of the many difficulties that may arise, it may be expected that in the future natural increases will play an important role in insuring the future of the Israeli population. The future trend of natural increase depends on marriages, fertility, and mortality. With regard to marriages, the conditions prevailing in Israel seem much more favorable than those prevailing in many Jewish communities abroad. Among the Jews of Israel there are practically no mixed marriages. The number of men and women remaining unmarried up to the end of the fertile period is small. With regard to the birth rate, it has been found that the high level of crude rates is influenced largely by the favorable age structure. Despite that, and despite the regression of birth rates in the past few years, the fertility of the Israeli Jewish population appears to be great. This is due mainly to the high fertility of the families of Asiatic and African origin, which supply over half the births in the Jewish population of Israel. With regard to mortality, it has been found that crude death rates are comparatively low, but this is due partly to the favorable age structure. As a consequence of all these factors, the Jewish population of Israel is increasing. Its demographic situation appears to be stronger than that of many communities in the Diaspora.

Schistosomiasis.—At the same meeting Dr. A. Michael Davies, Hadassah Medical School, said that schistosomiasis, one of the most widespread diseases of neighboring countries, was uncommon, although well established, in Palestine before 1948. Mass immigration brought to Israel over 250,000 immigrants from countries of the Mediterranean and Near East where schistosomiasis is endemic. The presence of the appropriate snail vectors led to fear that the disease might become widespread in Israel as well. The main difficulty in determining the extent of schistosomiasis in the immigrants lay in the inefficiency of diagnostic methods based on the recovery of eggs in the stools. After many trials, specific skin and complement fixation tests were devised; enabling the diagnosis to be made in at least 90% of cases. With these tests, a survey was made of over 2,000 immigrants from Iraq, Iran, Yemen, Morocco, and Afghanistan; 34% of the Yemenite, 8.2% of the Iraqui, and 6.8% of the Iranian immigrants were found to be affected, which, taken with smaller groups, gave an infection rate of 53 per thousand immigrants. It was also possible, for the first time, to construct a map of endemic focal areas in Yemen, to discover schistosomiasis exists in Afghanistan too, and to determine a new focus of infection in Iran without leaving Israel. The great increase in irrigation schemes and the building of fish ponds, all of which sooner or later become infested with the vector snails, represents a great potential danger. With the report of an outbreak of schistosomiasis in a small settlement in the Jordan Valley, the fears expressed above have been realized. At least 100 new cases were detected, and there is reason to believe that this area may become an endemic focus of the disease.

Vitamin B_{12} and Macrocytic Anemia.—At the same meeting Prof. M. Rachmilewitz, Hadassah Medical School, Jerusalem, stated that the vitamin B_{12} concentrations of the serum of normal subjects, of patients with macrocytic anemia, and of patients suffering from various other conditions have been determined with use of a mutant strain of Escherichia coli as a test organism. The total concentration in the serum of normal subjects ranged from 200 to 500 micromicrograms per milliliter. Similar values were found in serums from patients suffering from conditions other than macrocytic anemia. The vitamin B_{12} concentration of the serums of patients suffering from pernicious anemia in relapse and of patients with other types of macrocytic anemia were below the normal range and increased with effective treatment. In a series of women found to have anemia after delivery, the anemia was of the dimorphic type; i. e., it was characterized by hypochromia as well as macrocytosis. Accordingly, low serum-iron levels and low concentrations of vitamin B_{12} were found in the serums of these women. The iron deficiency, the vitamin deficiency, and the anemia improved gradually with adequate diet. No improvement occurred if interfering factors, such as infection, were present. Low concentrations of vitamin B_{12} were also found in many pregnant women of low social status and poor nutritional history. High concentrations of the vitamin were usually found in patients with myelocytic leukemia and other neoplastic diseases, such as lymphosarcoma and rapidly spreading carcinomatosis. The high concentrations of vitamin B_{12} in these patients were accompanied by an increased vitamin B_{12}-binding capacity of the serum proteins.

Medical Geography of Israel.—At the same meeting Dr. J. Seide, director, Rothschild Municipal Hospital, Haifa, said that Israel shares with other countries situated on the shores of the Mediterranean their major climatic and biogeographical characteristics. Anthropogeographically, however, she differs from them in many respects, because of mass immigration and the settlement of undeveloped areas. The composition of the population has undergone rapid changes through the influx of human groups with different constitutional, sociologic, and cultural characteristics. This also applies to the landscape, which has changed its aspect as a result of the draining of swamps, planting in the dunes, and bringing the desert areas under cultivation. All these factors exert their influence on the distribution of disease. The limestone formation of hills favors the origin of caves that harbor ticks of the genus Ornithodorus, known to be vectors of relapsing fever. Irrigation canals in citrus groves are infested by snails infected with Schistosoma haematobium or Schistosoma mansoni, and so the planting of new groves may play an important role in the spread of schistosomiasis. The susceptibility of Jews of Oriental origin to hemolytic disease and the cultivation of Vicia fave in many places may be held responsible for the occurrence of favism. Cattle and sheep breeding furthers the spread of brucellosis and leptospirosis in rural districts.

National Insurance Act.—The National Insurance Act, which came into force on April 1, 1954, provides old-age and survivors insurance for the whole population and maternity insurance and work accident insurance for applicable groups. Though health insurance is not included in the act, the medical profession plays an important part in the implementation of the insurance aspects of maternity and work accidents. According to Dr. G. Lothan, director, National Insurance Institute, Jerusalem, a unique feature not to be found in social legislation in other countries is the fact that eligibility for the maternity grant depends on the hospitalization of the mother. This clause has already increased the percentage of hospital births to 95% in the Jewish population. As to maternity allowance, the allocation of the benefit depends on a physician's certificate showing the expected day of birth. The maternity allowance is paid, at earliest, six weeks before this day. The National Insurance Institute may deny the claim for maternity allowance if the claimant did not fulfill the instructions of the institute with regard to medical supervision during her pregnancy and delivery. Physicians play a major part in insurance for work injuries in that they have to certify disability and they give medical care to the injured worker either in hospitals or in clinics of the recognized medical services. They determine the degree of invalidity as members of medical boards and appeal boards and also fulfill a decisive task in medical and vocational rehabilitation. The National Insurance Institute enlists the services of specialists as guides and supervisors of medical care. It works in close cooperation with the Ministry of Health, the Medical Association of Israel, Hadassah Medical School, municipal and private hospitals, and the various sick funds.

NORWAY

Surgery in Norway.—Prof. H. F. Harbitz has published an article on the present status of surgery in Norway *(Nordisk medicin, July 21, 1955)* in which he notes that surgery has made rapid advances since the war and that the status and professional interests of Norwegian surgeons are protected by the Norwegian Surgical Association. Committees from this body and the Norwegian Medical Association issue certificates to specialists in surgery. To become such a specialist, the applicant must be trained in general surgery. Harbitz fears that specializing may cause surgery to be subdivided into narrow fields and may be entered in too early. After all, much progress in surgery has originated from the general surgeon. Almost the entire population of Norway is covered by compulsory health insurance, treatment in public hospitals being free of charge, while extramural treatment requires a small contribution by the patient. The hospitals destroyed in Norway during the war have now been rebuilt or repaired. Even the smaller public hospitals now have a surgical, medical, and radiological section, each with a specialist in charge. The surgical section may include an obstetric ward, or there may be a separate department for obstetrics and gynecology. In the larger hospitals the surgeons enjoy the cooperation of a large number of specialists and can benefit from recent developments in anesthesiology and biochemistry. The increasing use of blood transfusion has led to the organization of a blood bank, which in some places is provided by the Red Cross. Two new research institutes have been established at the Ullevaal Hospital, Oslo. At one of these, the University Institute for Respiratory Physiology, work is being done by Erikson on the relation of spirometric measurements to cardiopulmonary function. At the other, the University Institute for Experimental Medicine, renal function tests are being carried out to determine the clearance for each kidney separately.

Vaccination in the Families of Physicians.—The framers of the smallpox vaccination law recently adopted by the Norwegian Parliament took care to emphasize the importance of vaccination early in life, i. e., under the age of 2 years. No punitive clauses were included in the new law, for it was hoped that educational propaganda would be more effective. Such propaganda is expected of the medical profession, and its efficiency would naturally be enhanced if physicians set a good example for the public by the early vaccination of their own children. In an attempt to find out whether they really do so, Dr. K. H. Torp has carried out an investigation that is reported on in *Tidsskrift for den norske lægeforening* for June 1. Representing the public were 700 children between the ages of 2 and 12 years admitted to the hospital in the period 1952 to 1954. Of these children, 53% had been vaccinated. The medical profession was represented by 150 physicians who had 316 children over the age of 2 years and who were for the most part employed in the two main hospitals in Oslo. Only 56.3% of these children had been vaccinated. Seventy-six physicians had vaccinated all their children before they were 2 years old; 33 had vaccinated some but not all of their children; and the remaining 41 had not vaccinated any of their children. Among the 144 physicians questioned with regard to the vaccination rates of their first-born, second-born, and younger children, it was found that primogeniture seemed to favor vaccination. The vaccination rate was 66.6% for the first-born, 51% for the second-born, and only 38.2% for the later-born children.

Pathogenic Micrococci (Staphylococci).—At the Gade Institute in Bergen studies have been undertaken on pathogenic micrococci (staphylococci) and their carriers. Vogelsang and Kaass of the pediatric clinic in Bergen have taken swabs from the throats and noses of 1,346 patients in this clinic during the period June, 1952, to July, 1953. The mothers of some of these patients and the staff of the clinic served as controls. Pathogenic micrococci were isolated in 73.6%of the patients. This carrier rate had risen to 78% on discharge from hospital—a rise interpreted as showing that hospitalization promoted contamination with pathogenic micrococci. A further argument in the same direction is that the carrier rate increased with the duration of the stay in the hospital. A comparison of the patients, according to whether they were treated with sulfonamides and/or antibiotics, showed no important difference in the carrier rates of the treated and the nontreated patients. At the pediatric clinic it is customary for children less than one year old to be nursed by attendants wearing face masks, the same rule being extended to physicians and visitors. This precaution has not prevented the spread of pathogenic micrococci to infants. In addition to persistent carriers and persistent noncarriers, there are many patients in a children's hospital who behave as intermittent carriers. The number of such intermittent carriers at a given time depends on the contamination of the environment with pathogenic micrococci.

Jobs for Medical Students.—Dr. Kaare Schanke has questioned several medical students about the holiday occupation they undertake. As the rate of pay does much to determine the choice of occupation, students are more likely to work as street car conductors than to work in hospitals. A conductor earns about 1,200 kroner per month, and the pay of a student intern is about half that amount. Furthermore the hours in a hospital are likely to be much longer than those on a street car. Schanke believes this state of affairs to be most unfortunate.

CORRESPONDENCE

TREATMENT OF ACNE VULGARIS

To the Editor:—As a general practitioner of almost 20 years' experience, I strongly object to one statement in the editorial on acne vulgaris by Dr. Stephen Rothman, appearing in the Nov. 12, 1955, issue of THE JOURNAL, page 1124. I completely concur with the scientific discussion but disagree with the next to last sentence. A specialist is not necessary to treat acne vulgaris. The intelligent, alert practitioner can successfully treat 99% of these patients. He is familiar with the patient's environment, food habits, and tension problems; he knows how to administer all of the sulfur medicaments; and, certainly, he can use ultraviolet as effectively as anyone. Only if the case becomes so resistant that sandpaper therapy and x-ray treatments are indicated is it necessary to advise special care. Such cases are usually caused by the patient's traveling from doctor to doctor in his anxiety and impatience to effect an immediate, or miraculous, result. It is not my intention to usurp the place of the specialist but rather to emphasize the fact that the general practitioner, too, has his importance. If he utilizes all his available knowledge, it is not impossible, as the editorial leads one to believe, for the practitioner to successfully treat acne vulgaris. The editorial advises specialist care much too easily, which is detrimental to the general practitioner who, in these modern times, is a capable physician and not just a reference department.

LUMBAR TRACTION

To the Editor:—It was with more than casual interest that I read the article on lumbar traction therapy by Dr. Bernard D. Judovich in THE JOURNAL, Oct. 8, 1955, page 549. For many years, I have been interested in pelvic traction therapy for low back disorders, and my method was published in *Surgery, Gynecology and Obstetrics,* June, 1954. In his article, Dr. Judovich fails to differentiate as to when he is talking about pelvic traction or referring to leg traction, which makes it difficult to evaluate his statements. My studies fully agree with his statements as to the "ascending force dissipation"; namely, the higher the point of traction desired, the greater the amount of weight that must be placed for traction. Clinically, his statements that only weight applied that exceeds 26% of the body weight exerts any force on the body is not borne out. With the patient in a Trendelenburg position, an average of 20 lb. will be felt by the patient, if applied through a properly designed pelvic belt. The patient's statement that he feels the pull "right where I want it—where my pain is" or, if the weight exceeds the optimum for the individual, he complains of pull in the dorsal region is the clinical evidence I submit. A traction of as low as 25 lb. easily draws the patient to the foot of the bed. What has become of the "surface traction resistance" of the body? Rothenberg and co-workers (*Surg., Gynec. & Obst.* 96:564 [May] 1953) in their painstaking study on the effects of leg traction, were able, with an electromyogram, to show muscular activity, the intensity diminishing to a negligible amount as the muscles of the low back were tested. Of the many colleagues I have interviewed, who are using pelvic traction, and in my own experience, I have not, as yet, had a single patient state that he was suffering from headaches as a result of the Trendelenburg position essential in pelvic traction. I am fully appreciative of the efforts Dr. Judovich expended in his study. In my mind questions arise as to whether the use of two cadavers with irreversible changes and a medical student, who I presume was in good health and not suffering from any low back disorder, can justify the conclusion that a certain method "is of no value in overcoming muscle spasm" and as to the amount of weight needed for traction to be felt at any given point. The results would be invaluable if the effects of pelvic traction could be carried out by the method employed by Rothenberg and co-workers who use roentgenograms, calipers during surgery, and electromyogram measurements on patients while the traction was in effect on patients with herniated disk. Unfortunately, it has become axiomatic when we cannot understand the manner in which a modality effects its benefits to ascribe its virtues in that it "confines the patient to bed." In my experience, leg traction, which is far more confining to bed than pelvic traction, has proved worthless; keeping the patient in bed without an appliance has made it necessary to use not only sedatives but, at times, narcotics. Does this sound as if the virtues of pelvic traction are due to confining the patient in bed? It is encouraging to note that, in recent years, more detailed study is being made of the conservative treatment of low back syndrome. In order that results that are being reported may be evaluated, the authors should strive to be more distinct in the delineation of the various methods they are condemning or approving. In that way alone can we verify each other's work and progress be achieved in a painful disorder.

SURPLUS FOODS

To the Editor:—The doctors of the United States may not be aware of what food is available to nonprofit hospitals, lunch programs, and the needy in their districts. I have received a letter from the assistant secretary of the Department of Agriculture, Washington, D. C., which reads in part as follows: "This is in reply to your letter inquiring about surplus foods that will be available for eligible institutions, including hospitals. Foods acquired by the Department under its price support and surplus removal programs may be made available to nonprofit school lunch programs, charitable institutions, including nonprofit hospitals, and to families and persons determined by appropriate state and local public welfare agencies to be in need. The foods currently available nationally include butter, cheese, nonfat dry milk solids, dried beans, rice, and shortening. Eggs, meats, and fruit juices are not available." Information concerning the availability of these foods in various territories may be obtained from Mr. Earl L. Butz, Assistant Secretary, Department of Agriculture, Washington, D. C.

ITALIAN PHYSICIANS

To the Editor:—I am soliciting the following information on the behalf of Dr. Bruno Manzone of the Instituto Superiore de Sanita, Rome, Italy: (1) names of Italian physicians who have either studied medicine abroad and practiced in the United States or are of Italian descent and who have studied medicine here in the United States and are here practicing and who have contributed effectively to public health or medical practice; (2) those who are or have been associated with medical institutes, hospitals, or clinics dealing primarily with an Italian clientele; (3) biographic, bibliographic, or historical materials that bear upon the contributions of such Italian physicians and most particularly any published material that in any way ligates Italian medicine with American medicine; and (4) information on the organization of Italian medical societies or associations currently existing or of time past.

LET BRITISH BABIES HAVE TWO HEADS!

Richard Gordon

So we are to have a new classification of pathology.

"Now, my boy, tell the examining board what you make of that specimen."

"Cholangitis with gall-stones, sir."

"Excellent! Would you say it was a disease of public interest?"

"No, sir. Unless it happened to a Cabinet Minister or someone else important."

"Quite so, quite so. A sniffle in a princess would go on the front page, of course. How about this case here?"

"Congenital generalized hypertrichosis. The poor child was born covered with hair. Very rare."

"Correct. Of public importance?"

"Oh yes, sir. 'Ape Boy Born In Peckham——' "

"Good, my lad, you've passed."

The notion that anybody's disease—short of rampaging smallpox—is of legitimate interest to the rest of the public seems as revolutionary an idea to the medical profession as the introduction of aseptic surgery. But the doctors have admitted the principle, and now the B. M. A. meets Fleet Street—apparently only to prevent such embarrassments as Sir Charles Quinsey's discovery, when looking through a laryngoscope down the throat of a film star, that a man from the evening papers is squinting over his shoulder.

Even a well-meaning P. R. O. appointed by the National Health Service to each hospital wouldn't much alter the clinical trend of the Sunday papers. I know this because I once worked on a medical journal sufficiently enlightened to hold a layman's Press conference every week. This was to indicate articles of public importance, and so further health education, self-knowledge, public health, personal hygiene, and other noble ideals. The reporters were always polite eager young men, who put out their cigarettes and kept calling everyone doctor. But the conferences were never a success.

"A most interesting article this week on hookworm," I would begin. "This is one of the most widespread and important global infections, the physical and economic consequences of which may——"

"Excuse me, doctor, but what's this paragraph about a girl thinking she was a man?"

"Oh, very minor, a dull hallucination in one single case. Now, this paper proving that if everyone ate, drank, and smoked less they'd be much healthier and——"

"Doctor, what are these *monsters?*"

"Monsters? Merely a technical term for a malformed fœtus. Of no importance to the public. The Report on page five of the World Health Organization——"

Next Sunday I would see SHE THOUGHT SHE COULD BE A FATHER and BRITISH MOTHERS HAVE MONSTERS, all quoting our journal. I wondered if the painstaking authors of the long scientific papers knew that their most enthusiastic readers were not the practising doctors—to most of whom the greatest value of a medical journal is reminding them it's Friday again by thumping on to the doormat—but the worried men in newspaper offices who read the whole issue through the night before publication, as earnestly as students before their scholarships.

The newspapers' complaint that they can never extract information from doctors about their cases would be utterly incomprehensible to the gentleman who taught me surgery, Old Blood and Thunder. No reporter would have dared to question him in the hospital corridors—no more would he have buttonholed the Lord Chief Justice and asked what he gave for the prisoner's chances. Blood and Thunder allowed that *The Times* could give politely woolly reports of the notable invalids, but mentioning someone's clinical state in the Press struck him as no less outrageous than publishing the full postmortem report in the middle of a bishop's obituary.

Blood and Thunder would never tell the newspapers anything; but he never told his patients anything either. The worried supplication "What's *wrong* with me, doctor?" brought the reply, if he was in a good mood, "It's only a lot of long Latin names, my dear fellow, and you wouldn't understand a word of it," or "It's none of your damn business," if he wasn't.

The time thus saved in his professional lifetime undoubtedly enabled him to remove several hundred more stomachs. This suggests that the P. R. O. is wanted *inside* the hospital, to help the overworked medical staff.

The public to-day aren't satisfied with the simple admission "You've got an ulcer" or "We're going to take out your thyroid." They want half an hour's lecture on the type of ulcer, the x-ray appearances, and the prognosis; or they tell the surgeon he'll catch it if he so much as nips one of their recurrent laryngeal nerves. The trouble is, they've been reading the newspapers.

MEDICAL FILM REVIEWS

Safe Tuberculosis Nursing: 16 mm., black and white, sound, showing time 21 minutes. Produced in 1950 by and procurable on loan from Veterans Administration, Central Office Film Library, Vermont and H streets N.W., Washington 25, D. C.

This film depicts the strict precautionary techniques that are carried out in the Veterans Administration tuberculosis units. Its theme is that, by following the suggested procedures, all personnel in the unit, as well as patients and visitors, are given protection and that tuberculosis nursing can be safe. The film is centered around the daily routine of an attractive young nurse and covers the gown room, gown, cap, mask technique, handwashing, morning care, thermometer technique, serving of food, dishwashing, transportation of patients, instructions to visitors, and the nurses' responsibility in teaching and supervising other staff members. The precautions necessary in cleaning the rooms are brought out, as are the procedures necessary for the safety of librarians, occupational therapists, and other personnel. Environmental requirements necessary for carrying out proper protective measures are given attention. While the film deals almost exclusively with mechanical aseptic procedures, it also creates interest in the equally important areas of health teaching, mental hygiene, and the social and financial aspects that are all necessary in a tuberculosis control program. All tuberculosis hospitals will find the film of value whether or not they observe the strict aseptic techniques recommended by the Veterans Administration. The film will be of interest and should be shown (perhaps twice) to every person working in a tuberculosis hospital. It fortifies teaching and is good for review as well as orientation. Most hospitals will want to keep the film (perhaps two weeks) for consideration of time schedules of various departments. It is invaluable as a teaching aid for affiliating students and equally important for student nurses in general hospitals not having a tuberculosis affiliation. Graduate nurses in general hospitals, university schools of nursing, and medical schools should find the film of value. The narration is excellent.

Pruritus Ani: 16 mm., color, silent, showing time 34 minutes. Prepared by Manuel G. Spiesman, M.D., and Louis Malow, M.D., Chicago Medical School. Produced in 1955 by and procurable on loan (service charge $5) from Mervin LaRue, Inc., 159 E. Chicago Ave., Chicago 11.

This film gives the authors' simplified classifications of pruritus ani and the office and home treatments of each type. Color photographs show the various pruritides and the application of treatment for each. The clover leaf operation for the intractable type is shown in detail. This operation, which is a modification of the undercutting operation described by Sir Charles Bell many years ago, is very well demonstrated. This film presents a practical classification of anal pruritus; however, the material on treatment of amebiasis is extraneous. The dermatologist could make a valuable contribution to this presentation. The photography is good. This film is recommended for house officers and general practitioners with a word of caution as to the use of cortisone as well as of the undercutting operation.

MEDICAL LITERATURE ABSTRACTS

INTERNAL MEDICINE

Liver Disease in Sickle Cell Anemia: A Correlation of Clinical, Biochemical, Histologic and Histochemical Observations. A. Bogoch, W. G. B. Casselman, M. P. Margolies and H. L. Bockus. Am. J. Med. **19**:583-609 (Oct.) 1955 [New York].

Recent studies of the liver in sickle cell anemia reveal a high incidence of hepatic damage and a variety of causes contributing to jaundice and hepatomegaly in this disorder. Clinical and biochemical studies and histological and histochemical observations on liver tissue obtained by needle biopsy were made on four patients with sickle cell anemia. There was one instance of hepatitis, one of hemochromatosis, and two of portal cirrhosis. Serial liver function tests were performed in each case. Hypoalbuminemia and hyperglobulinemia, with elevation of the gamma fraction and a decrease in the alpha$_1$ globulin values, were the most consistent serum protein alterations. The finding of elevated serum amylase and lipase values in this disease is of interest in view of its abdominal manifestations that may be confused with acute primary pancreatitis. Hepatitis in one patient was thought to be a manifestation of the sickle cell disease itself. Focal parenchymal lesions were found in the liver of this patient during the recovery stage and in the liver specimens of the other three patients. Ischemia, the result of sinusoidal obstruction by red blood cell clumps, appears to be the most likely cause. Some of the parenchymal changes may be due to a "hepatotoxin" associated with sickle cell crises. It is possible that some of the necrotic lesions, when prominent and repeated, may be followed by cirrhosis as another hepatic manifestation of sickle cell anemia. The precise role of iron-containing pigment in the pathogenesis of the cirrhosis in one of the four patients is in doubt. Hemochromatosis in one patient was unquestionably related to multiple blood transfusions. The possibility of hepatic damage, consequent to multiple blood transfusions given to maintain hemoglobin levels in this disease, deserves consideration. Histochemical studies revealed no or only mere traces of lipids in the cytoplasm of the parenchymal cells. This is of interest in view of the anemia extant in these patients who were fasting at the time of biopsy.

Cobalt Therapy in Anemia. J. M. Hill, J. LaJous and F. J. Sebastian. Texas J. Med. **51**:686-690 (Oct.) 1955 [Austin, Texas].

The authors used cobalt or cobalt and iron preparations in 115 patients with various forms of anemia over a period of eight years. At first they used cobalt only in cases of anemia that were refractory to other treatments, such as in those associated with chronic infection, especially chronic arthritis, and the hypochromic anemias not responding to iron. Cobalt chloride usually was prepared to provide from 20 to 80 mg. of the salt per teaspoonful. Dosage in adults was kept around 50 mg. daily and in children from 10 to 30 mg. daily. The solution was added to cold water or milk and usually taken after meals. Later, larger doses ranging from 100 to 160 mg. daily were employed, but with these nausea was often a problem. When enteric cobalt-iron combinations became available, these were employed, except in patients in whom iron overload was evident (for example, following many transfusions) or in whom bone marrow iron stores were maximal. Enteric coated cobalt chloride tablets in 100 mg. sizes, both with iron (200 mg.) and without it, were also made available to the authors for these unusual cases. Although nausea, or more rarely vomiting, resulted from elevated dosage or prolonged therapy, it was found that, after omission of the drug for an interval of a few weeks, it was possible to resume the therapy. Cobalt was used in the following heterogenous group of anemias: those due to infection, blood loss anemia, iron deficiency anemia, azotemia, anemia associated with arthritis, nutritional anemia of infants and children, hypoplastic and aplastic anemias, hemolytic anemias of congenital and acquired types, hereditary leptocytosis (Mediterranean anemia), and, finally, anemia associated with other blood dyscrasias and malignant neoplasms such as the various leukemias, multiple myeloma, Hodgkin's disease, and reticulum sarcoma. No apparent benefit was derived from cobalt therapy in acute aplastic anemia, leukemia, Hodgkin's disease, and multiple myeloma. Results were doubtful in hereditary leptocytosis and most of the hypoplastic anemias. Cobalt therapy produced the best results in the anemias associated with low grade infection, arthritis, blood loss, and iron deficiency and in hemolytic anemia. Particularly noteworthy was the effect of cobalt therapy in 18 pregnant women with anemia, most of whom had not responded adequately to prior iron therapy. In comparison with a control group of 63 patients receiving iron alone, the cobalt-iron group of patients gained an average of 1.73 gm. of hemoglobin per 100 cc. of blood, while those receiving iron alone showed an average gain of 0.73 gm. per 100 cc. It is well established that cobalt has a powerful erythropoietic effect with an increase in erythrocyte precursors in the bone marrow. The recognition of the role of cobalt in normal metabolism as part of the vitamin B_{12} molecule should remove prejudice against this agent. The direct stimulating effect on erythropoiesis considered in this paper is obviously by a different mechanism.

Pernicious Anemia with the Absence of Typical Anemia. Z. Plotkin. Arizona Med. **12**:458-466 (Oct.) 1955 [Phoenix, Ariz.].

The author calls attention to the fact that, since the advent of mass consumption of vitamins, especially folic acid and vitamin B_{12}, and of certain antibiotics, patients are likely to present themselves with neuropathy and with achlorhydria without the typical hematological picture of pernicious anemia. There is danger that these cases will not be correctly diagnosed and properly treated, because of the absence of the characteristic blood and bone marrow findings. The daily oral intake of 5 mg. of folic acid produces a hematological remission, while the spinal cord lesions are aggravated in pernicious anemia. It was definitely shown that folic acid requires no intrinsic factor and has a direct action upon the bone marrow, converting a megaloblastic into a normoblastic bone marrow. Vitamin B_{12} plus intrinsic factor, incorporated into many available vitamin preparations, when taken orally tends to suppress megaloblastic erythropoiesis while being insufficient to cause amelioration of the progression of posterolateral cord changes for which massive parenteral medication is required. The mechanism of action of penicillin or Tetracyn is not as yet confirmed with certainty, but apparently they effect increased intestinal absorption of vitamin B_{12} by increasing its biosynthesis. In the present era of vitamins and antibiotics, physicians may observe pernicious anemia without anemia. The author presents the histories of two patients to illustrate this problem of the delay of proper diagnosis and treatment in the absence of characteristic hematological findings while serious neurological lesions were progressing.

Tetracycline Therapy of Pneumonia. F. Bakir, S. Katz and G. McCormick. South. M. J. **48**:1031-1038 (Oct.) 1955 [Birmingham, Ala.].

Tetracycline was given to 58 patients with various types of acute bacterial pneumonia. The patients were acutely ill and had all the clinical characteristics and roentgen manifestations

---

The place of publication of the periodicals appears in brackets preceding each abstract.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individuals in continental United States or Canada who subscribe to its scientific periodicals. Requests for periodicals should be addressed "Library, American Medical Association." Periodical files cover 1946 to date only, and no photoduplication services are available. No charge is made to members, but the fee for others is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time, and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

of acute pneumonia. The group included 36 males and 22 females ranging in age from 13 to 79 years. Thirty-nine of the patients were alcoholics. Four had asthma, two had bronchiectasis, one had congestive heart failure, one had an esophageal diverticulum with recurrent pulmonary infection, and two had inactive tuberculosis. Pneumococci were isolated from the sputums of 24 patients. In two patients pure cultures of beta-hemolytic streptococci were found and in two others Klebsiella pneumoniae was the etiological agent. Hemophilus influenzae was the responsible organism in one patient. Sputum cultures in 22 patients showed no clear-cut predominating organism, but it is probable that most, if not all, of these patients had lobar pneumococcic pneumonia. Sputum cultures in seven patients showed coagulase-positive Micrococcus pyogenes var. aureus as the dominant organism. Tetracycline was given by mouth in doses of 0.5 or 0.25 gm. every six hours. One patient received 0.75 gm. every six hours. The results of tetracycline therapy were excellent in 25 patients, in 24 the response was good but delayed, in 2 the response was slow, 4 patients died, and complications (empyema or pulmonary abscess) developed in 3 patients. On the basis of their experience with penicillin in the treatment of lobar pneumonia, the authors conclude that tetracycline is somewhat inferior to penicillin. In mild and moderately severe pneumonia in which the organism is sensitive to tetracycline, a favorable response can be expected when 0.5 gm. is given every six hours. In patients with mild bacterial pneumonia in whom the organisms are sensitive to tetracycline, 0.25 gm. every six hours is effective. Tetracycline appears to be somewhat more effective than its analogues, oxytetracycline and chlortetracycline, on the basis of tolerance, plasma levels, and concentration in body fluids. This study suggests that it is merely equal to its analogues in therapeutic effectiveness in all forms of acute bacterial pneumonia.

Lung Cancer Death Rates Among Non-Smokers and Pipe and Cigarette Smokers: An Evaluation in Relation to Air Pollution by Benzpyrene and Other Substances. P. Stocks and J. M. Campbell. Brit. M. J. 2:923-929 (Oct. 15) 1955 [London, England].

As a result of two years of study of the environmental histories of patients with cancer and persons without cancer in Great Britain, death rates from cancer of the lung and bronchus were calculated among men of different smoking habits living in a rural area of Wales, in a mixed area of urban and rural districts around Chester and Wrexham, and in Liverpool county borough. The death rates were compared with measurements of benzpyrene and other substances present in the air at various places within those areas. Results showed that the rural death rate increased proportionally to the number of cigarettes smoked per week and that pipe smokers as a group ranked with smokers of about 25 cigarettes a week. Liverpool rates exceeded the rural rates in every smoking category, but the urban/rural ratio fell progressively from about nine to one among nonsmokers to a small value approaching unity among heavy cigarette smokers. The absolute urban excess was much the same in each smoking group, suggesting that an urban factor was added to the effects of smoking. Differences in smoking habits of the populations can account for only a small fraction of the contrast in total rates, and it is estimated that in Liverpool about half the deaths of men between the ages of 45 and 74 years from cancer of the lung arise from cigarette smoking and about three-quarters of the remaining half are caused by a factor that is only slightly present in the rural area. The chemical investigation of the concentration of smoke and of the carcinogen 3,4-benzpyrene, other polycyclic hydrocarbons, and sulfur dioxide in the air revealed that these concentrations rise with increasing urbanization, the benzpyrene figure in Liverpool being 8 to 11 times as great as in the rural localities examined. This ratio corresponds with the estimated mortality ratio among nonsmokers living in those areas. When the death rates were compared with calculated total intake, by different categories of smokers in the urban, mixed, and rural areas, of benzpyrene derived from air according to certain assumptions, plus that derived from the number of cigarettes smoked, the degree of correspondence was such as to suggest that benzpyrene might be the one agent involved. Although the authors' evaluation was based on observations made in the course of only two years instead of on five-year death rates, this preliminary report seems to be justified because the two-year rates make the supposition tenable that benzpyrene plays a dual part through cigarettes and air pollution. Such a working hypothesis may assist research work in this field whether or not it is finally substantiated.

Factors Influencing Relapse in Pulmonary Tuberculosis: A Statistical Analysis of 1,259 Patients Followed from Eleven Months to Six Years After Discharge. T. Oyama. Am. Rev. Tuberc. 72:613-632 (Oct.) 1955 [New York].

This study was undertaken to evaluate the factors that play a part in relapse of pulmonary tuberculosis, understanding of these factors being important in efforts to reduce the frequency of reactivations of the tuberculous process. The analysis is based on the records of 2,571 patients who were discharged from Glen Lake Sanatorium during the period from Jan. 1, 1948, through Dec. 31, 1953. Of this number, 1,534 patients were found to have an uncomplicated adult type of pulmonary tuberculosis that could be adequately evaluated. Sufficient follow-up reports were obtained in 1,259 patients, and these patients were *observed for periods ranging from 11 months to six years.* The cumulative incidence of reactivation during the period of observation following discharge was 28.5%. There were no significant correlations between the incidence of relapse and the following factors: (1) right-sided or left-sided lesions in patients in whom the disease was unilateral, (2) duration of disease, (3) length of hospitalization, (4) duration of bed rest alone, and (5) particular chemotherapeutic regimens when used alone. The factors of relapse in pulmonary tuberculosis are so complicated that one factor may be analyzed alone without finding any apparent association with the rate of reactivation, but, if combined with another factor, it may be found to have a significant correlation with the incidence of relapse. The post-treatment relapse rate for pulmonary tuberculosis was definitely higher in males than in females. If the age was also taken into account, however, it was found that there were no important differences in relapse rates for the two sexes in certain age groups, namely, 10 to 29 years of age and in patients more than 70 years of age. Discussing possible explanations for the greater tendency to relapse of pulmonary tuberculosis in patients in the older age groups, the author points out that these patients had less adequate treatment during the acute phases of tuberculosis. Furthermore, their age would often make resectional surgery inadvisable. The so-called latent tuberculosis in the older age groups should receive more attention because of the great potentiality for progression. The type of treatment appeared to influence significantly the incidence of reactivation. Prolonged chemotherapy for one year or more was remarkably effective in preventing relapse, as was lung resection combined with chemotherapy. Resection plus chemotherapy was superior to chemotherapy alone in patients with far advanced tuberculosis, but this was not the case in patients with moderately advanced tuberculosis.

Relapse of Pulmonary Tuberculosis After Five Years or More of Arrest. R. S. Mitchell. New England J. Med. 253:640-643 (Oct. 13) 1955 [Boston].

From information accumulating about the pattern of primary relapse after the attainment of arrest of pulmonary tuberculosis, it appears that the vast majority of such relapses occur within five years of attainment of arrest. This report is concerned with relapses that occur after five years or later. Between 1948 and 1954 various retrospective studies of patients with pulmonary tuberculosis were made at Trudeau Sanatorium. All patients with active minimal disease admitted to the sanatorium between 1927 and 1946, all patients with active, advanced disease admitted between 1930 and 1939, all patients with phrenic-nerve interruption admitted between 1926 and 1946, and all patients with artificial pneumothorax initiated between 1930 and 1939 were included. Among over 3,600 patients there were 115 patients originally classified as having primary relapse five years or more after attainment of arrest with whom contact had been maintained. Between 1951 and 1954 a redoubled effort was *made to obtain every available chest roentgenogram and all* clinical data from physicians, hospitals, health departments, and the patients themselves. All 115 patients answered special questionnaires. Relapse is defined as bacteriological or radiological evidence (or both) of active tuberculosis somewhere in the body occurring after arrest. The data obtained on the 115 patients suggested that at least 48 had evidence of chronic active disease during part or all of the time between arrest and relapse. In 28 other patients there was suggestive clinical evidence of chronic active disease, and in 8 others roentgenograms and other clinical data revealed that the time elapsed from arrest to reactivation was actually less than five years. There were therefore only 31 of the 115 patients who, on close inspection, actually met all the requirements of this study. The new disease at the time of relapse was found at or very near a preexisting focus in 24 of the 31 patients. It is of particular interest that 8 of the patients were physicians and 4 were nurses, 11 of whom resumed their former work with some probability of occupational exposure. A pathologist frequently exposed occupationally to tuberculous tissue containing drug-resistant organisms recently had a reactivation of his pulmonary tuberculosis at the site of his preexisting disease. His originally minimal lesion had been inactive for over five years, and he had never taken streptomycin, aminosalicylic acid, or isoniazid. Tubercle bacilli isolated from his sputum before any chemotherapy was begun for the relapse were resistant to both streptomycin and aminosalicylic acid and susceptible to isoniazid. Several similar cases are mentioned, and it is suggested that reactivation at or near the site of a preexisting focus can no longer be regarded as conclusive proof of endogenous reinfection. Furthermore, since there is some suggestion that Mycobacterium tuberculosis tends to die out in closed necrotic foci with or without chemotherapy as time goes on, it is possible that reinfection after five years or more of clinical, bacteriological, and roentgenographic control of disease will be exogenous rather than endogenous.

Pulmonary Lesions in "Rheumatoid Disease" with Remarks on Diffuse Interstitial Pulmonary Fibrosis. E. H. Rubin. Am. J. Med. 19:569-582 (Oct.) 1955 [New York].

"Rheumatoid disease" is a more descriptive term than rheumatoid arthritis, since it expresses a widespread process involving not only the locomotor system but also other parts of the body. With increasing use of routine chest roentgenography, changes are being discovered in the lungs of patients with rheumatoid disease indicating that these organs are involved quite frequently and early in the course of the disease. Within a space of two months the author had occasion to observe three patients with acute rheumatoid disease with characteristic articular manifestations in whom the chest x-ray findings were in keeping with a systemic disturbance. In two cases it was possible to obtain lung biopsies for histological study. The histories of these patients are reported. The pulmonary lesions may simulate acute atypical pneumonia, acute rheumatic pneumonia, or acute, diffuse interstitial pulmonary fibrosis. In some cases these several manifestations represent one and the same disease. Recently the author has observed a fourth patient with rheumatoid disease and diffuse interstitial pulmonary fibrosis. This 65-year-old woman had a history of concurrent onset of joint pains, fever, and acute respiratory symptoms diagnosed as pneumonia in another hospital. The disease was of eight months' duration. The chest x-rays and lung biopsy specimen revealed a picture similar to that noted in the other cases cited.

Staphylococcal Enteritis: Two Associated Fatal Cases. A. S. Todd and P. O. D. Hopps. Lancet 2:749-750 (Oct. 8) 1955 [London, England].

The histories of two patients with micrococcic (staphylococcic) enteritis are presented. Both fatal infections occurred in the same surgical ward, within a week, and were infections by the same strain of organism. The first of the two patients had been prepared for gastrectomy by injections of penicillin and streptomycin, and after a successful partial gastrectomy penicillin and streptomycin were given by mouth. Three days later a severe diarrhea began, and bacteriological examinations of the stools showed that gram-positive cocci had taken the place of the usual intestinal flora. Culture of a stool produced a profuse growth of Micrococcus (Staphylococcus) pyogenes sensitive to chloramphenicol, bacitracin, and erythromycin but insensitive to penicillin, streptomycin, chlortetracycline (Aureomycin), oxytetracycline (Terramycin), and tetracycline. In view of this a course of oral and intravenous administration of chloramphenicol was started, but the patient died on the fourth day of illness, six days after the operation. Autopsy revealed that the gastrectomy had healed satisfactorily, but the small intestine contained yellowish fluid in which floated shreds of membrane. Similar shreds adhered in a few places to the mucosa. Almost the whole of the small intestine appeared denuded of the superficial layers of mucosa. The large intestine contained an inspissated mass of the same yellow shreds, resembling caseous material. Histological studies revealed a pseudomembrane. The second patient had been treated at home for several weeks for a condition labeled Behçet's type of erythema multiforme. Unknown amounts of chloramphenicol and chlortetracycline had been given locally and systemically. At the hospital he was treated with oxytetracycline, and his lesions improved. He remained well until two days after the death of the first patient, when diarrhea developed, which resulted in death. Stool cultures and autopsy findings in the small and large intestine were identical with those in the first patient. The role of antibiotic treatment and resistant micrococci (staphylococci) in the causation of pseudomembranous enteritis is now firmly established. Apparently the antibiotic must fulfill three conditions before it can cause enteritis: 1. It must be ineffective against the infecting Micrococcus (Staphylococcus). 2. It must be lethal to the normal intestinal flora. 3. It must be given by mouth. These conditions are fulfilled when patients are treated with broad-spectrum antibiotics (or combined penicillin and streptomycin) in wards heavily infected with micrococci (staphylococci). They were fulfilled in the present cases.

Anaphylactic Shock After Penicillin Injection: Three Fatal Cases. A. H. Andersen. Ugesk. læger 117:1237-1240 (Sept. 22) 1955 (In Danish) [Copenhagen, Denmark].

The third of three cases in which the penicillin preparation is believed to have caused fatal anaphylactic shock in an asthma patient illustrates the danger of injecting penicillin when the patient has previously shown intolerance to the substance. The cases all support the assumption that compound penicillin preparations are more toxic than benzyl penicillin. The danger that penicillin injection may cause death is slight, but the possibility of anaphylactic shock must be included in one's considerations. Penicillin should be given only when clearly indicated. Before injection the patient must be asked whether penicillin has previously been given and, if so, whether it was tolerated without side-effects. If there were earlier symptoms of allergy, the drug should not be given.

Sarcoma of Thyroid Gland. A. S. Novaes. Rev. paulista med. 47:70-82 (July) 1955 (In Portuguese) [São Paulo, Brazil].

Sarcoma of the thyroid gland is more frequent than is believed. It is highly malignant, grows rapidly, and gives early metastases to the lung, bones, liver, kidneys, pleura, brain, and regional and distant lymph nodes. It may develop simultaneously with a rapidly growing thyroid nodule or in an apparently normal thyroid gland. In the pretumor stage the firmness of the thyroid is increased and the mobility of the structure disappears. Symptoms of hyperthyroidism do not appear. The early symptoms are acute pain, radiating to the lateral shoulder and arm, dyspnea, and many other grave respiratory, nervous, and cardiovascular disorders. The tumor rapidly causes infiltration of the trachea and compression of the larynx and of important nerves and other structures. An early diagnosis is difficult. The test of radioactive iodine that measures the function of the thyroid nodules in comparison with that of perinodular normal tissues for emanation of radiations is of value. Prevention of thyroid sarcoma calls for systematic resection of all thyroid nodules, single or multiple. The curative treatment varies with the stage of the disease from total lobectomy, with regional lymph node dissection and resection of certain lateral veins, to total thyroidectomy, with ample regional lymph node dissection, resection of certain lateral veins and of an ample segment of the internal jugular vein, dissection of one of the recurrent nerves, and in certain cases parathyroidectomy. When tumor compression of the larynx is present, the treatment is palliative only, consisting of removal of tumor tissues, as ample as possible, or a tracheotomy. Tracheotomy is often indicated as an emergency. Local implantation of radium, roentgen therapy, and use of radioactive iodine are of no value in the advanced stage of the disease. The author reports on two women and a man between the ages of 50 and 73 first seen when their disease was in the inoperable stage. The tumor developed in the left lobe of the thyroid gland in all three patients. One of the patients had a nodular goiter, prior to the development of the sarcoma. The nodule had been inactive all through her life and suddenly became malignant shortly before the first consultation. In the other two patients, sarcoma developed in an apparently normal thyroid gland. In all cases the sarcoma was of the polymorphocellular type. The operation was only palliative. The patients died within two months after the operation. A patient died two weeks after the operation as the result of an acute hemorrhage from the operative wound. The other patient died two weeks after an emergency tracheotomy complicated by hemorrhage.

Determination of Protein-Bound Iodine in Serum in Evaluation of Thyroid Function. B. Skanse. Nord. med. 54:1419-1423 (Sept. 15) 1955 (In Swedish) [Stockholm, Sweden].

Determination of the protein-bound iodine in the serum by Riggs and Man's method in 192 patients and by a modification of Barker and Humphrey's method in 216 patients gave a correct picture of the thyroid function in about 92% and 94% of the cases respectively. Barker and Humphrey's simpler alkali ashing method is preferred for clinical use. Determination of the protein-bound iodine in the serum, properly applied, constitutes a valuable diagnostic method in cases where it is difficult to estimate the function of the thyroid. The procedure cannot be used to evaluate the thyroid activity when the patient has been given iodine either in the form of iodides or organically bound iodine. Analysis in 18 patients with hypothyroidism indicates that determination of the protein-bound iodine in the serum before and after administration of thyrotropic hormone is useful in the differential diagnosis between primary and secondary hypothyroidism.

Intramuscular Trypsin in the Treatment of Chronic Thrombophlebitis. C. J. Wildman. Angiology 6:473-481 (Oct.) 1955 [Baltimore].

Parenzyme intramuscular trypsin, a suspension of crystalline trypsin in sesame oil, each cubic centimeter containing 5 mg. of the active principle, was given to 10 selected patients with chronic thrombophlebitis. The patients were divided into three groups. The two patients in the first group were hospitalized and received 1 cc. of the drug every 12 hours for 10 days, 1 cc. twice a week for two weeks, and 1 cc. once a week for four weeks. There were four outpatients in the second group who received 1 cc. twice a week for two weeks, 1 cc. once a week for four weeks, and 0.5 cc. once a week for two weeks. The four patients in the third group were given 1 cc. once a week for two weeks and 0.5 cc. once a week for six weeks. All patients of the first and second groups showed impressive objective and subjective improvement; the response of the hospitalized patients was more rapid than that of the outpatients. Edema and induration were eliminated; healing of stasis ulcers was promoted. There was a tendency to restore the normal texture and color of the skin affected by postphlebitic pigmentation and eczema. The four patients in the third group showed an inadequate therapeutic response and after eight weeks of treatment did not exhibit any signs of substantial regression of the existing pathological condition. After eight weeks of initial therapy, treatment was suspended in all 10 patients for one month. During this interval, every patient was examined once a week. After about three weeks exacerbation of all symptoms invariably occurred. Resumption of treatment with 0.5 cc. of the trypsin suspension once a week tended to halt adequately the exacerbation and to maintain the level of improvement attained after the initial intensive course of therapy in the six patients originally treated. The four patients in the third group were finally put on the therapeutic regimen of the second group and made the same satisfactory progress toward subsidence of edema, induration, and ulceration. The results suggest that parenterally given trypsin has a local diuretic effect on the edema and induration associated with chronic venous insufficiency and on the collateral edema and hyperemia associated with acute inflammatory conditions.

Long-Term Treatment of Some Arteriopathies with Tromexan. C. M. Castro and G. Stritzler. Angiology 6:442-461 (Oct.) 1955 [Baltimore].

Ethyl biscoumacetate (Tromexan Ethyl Acetate) was given to 26 men and 3 women between the ages of 32 and 75 years, of whom 21 had arteriosclerosis obliterans, 5 thromboangiitis obliterans (Buerger's disease), and 3 Leriche's syndrome. The starting dose of the drug was 1,200 mg. (4 tablets) or 600 mg. (2 tablets), according to the patient's age and the condition of the capillary wall. This was followed by a maintenance dose of 150 mg. (½ tablet) every 12 hours or 75 mg. (¼ tablet) at the same interval according to the modifications of the prothrombin time, determined by Quick's test before the institution of the treatment and after that every eight days, or every three or four days if it fell to less than 30%. When the activity of the prothrombin time was lowered to a dangerous degree, administration of ethyl biscoumacetate was suspended and vitamin C was administered intravenously in a dose of 500 or 1,000 mg.; in addition, rutin was given orally in a dose of 200 mg. Only occasionally, if hemorrhage was copious, was 50 mg. of synthetic vitamin K administered intravenously every four hours. The duration of the treatment varied from 20 to 480 days. Results showed that long-term treatment with ethyl biscoumacetate is effective for patients with arteriosclerosis obliterans, thromboangiitis obliterans, and Leriche's syndrome. The drug promoted the healing of ulcers of the leg in five (80%) of six patients. Ethyl biscoumacetate apparently prevented serious complications that secondary thrombosis of the collateral network causes in patients with Leriche's syndrome due to trauma. Sixteen patients with arteriosclerosis obliterans, 4 patients with thromboangiitis obliterans, and 2 patients with Leriche's syndrome had paresthesias, which were improved or entirely disappeared in 14, 3, and 2 patients respectively. Intermittent claudication was present in 18 patients with arteriosclerosis obliterans, 5 patients with thromboangiitis obliterans, and 2 patients with Leriche's syndrome; it was improved or disappeared completely in 13, 4, and 2 patients respectively. Pain during rest was improved in the three types of patients 100, 50, and 100% respectively. Improvement of objective symptoms occurred in the three types of patients. Pulsation reappeared in 38 and 60%, respectively, in the first two types; oscillations improved or reappeared in 48, 40, and 33% respectively; and skin temperature improved or became normal in 61, 33, and 33% respectively. These results may be explained by the prevention of new thromboses and by the fibrinolytic, antispasmodic, eutrophic, and probably anti-infectious action of ethyl biscoumacetate.

External Electric Stimulation of the Heart in Cardiac Arrest: Stokes-Adams Disease, Reflex Vagal Standstill, Drug-Induced Standstill, and Unexpected Circulatory Arrest. P. M. Zoll, A. J. Linenthal, L. R. Norman and others. A. M. A. Arch. Int. Med. 96:639-653 (Nov.) 1955 [Chicago].

Attacks of Stokes-Adams disease are due to inadequate circulation resulting from very slow idioventricular rhythm, ventricular standstill, ventricular tachycardia, or ventricular fibrillation. Their manifestations include dizziness, syncope, prolonged unconsciousness, and convulsions, and they may end in death. Drugs and cardiac puncture, the only therapy heretofore available, are dangerous and often ineffective. The authors developed an apparatus that makes a new therapeutic approach possible. It is an externally applied cardiac pacemaker that stimulates the heart electrically, terminates ventricular standstill, and maintains an externally paced ventricular rhythm for long periods. The cardiac pacemaker is a stimulator that is attached to the patient by two output wires connected to circular chest electrodes. After experimental studies in animals had established the efficacy and safety of external electric stimulation of the heart, the authors used it clinically. Of 37 patients with recent Stokes-Adams attacks, 25 required resuscitation with an external electric cardiac pacemaker. It resuscitated them repeatedly from ventricular standstill and maintained an adequate circulation for as long as five days during persistent standstill. Ten survived 1 to 24 months after resuscitation. From these experiences a program for the treatment of Stokes-Adams disease has been developed, combining the use of drugs with the electric pacemaker. External electric stimulation was also effective in resuscitating three patients with ventricular standstill, syncope, and convulsions due to reflex vagal stimulation. Ventricular standstill due to digitalis or procainamide was terminated by external cardiac stimulation in four patients, two observed by the authors and two treated by others. In one of their patients and in four patients treated by others, the external pacemaker resuscitated the heart from unexpected circulatory arrest due to ventricular standstill. In seven other patients it was ineffective in the presence of ventricular fibrillation or myocardial unresponsiveness due to anoxia from delay in treatment. Prompt external application of the electric pacemaker should be carried out in these emergencies before one resorts to thoracotomy and cardiac massage.

Rupture of the Interventricular Septum. R. G. S. Malone and W. E. Parkes. Brit. Heart J. **17**:448-452 (Oct.) 1955 [London, England].

Rupture of the interventricular septum occurred in seven patients admitted to two Belfast hospitals. Suggestive clinical signs are the appearance of a loud precordial systolic murmur, maximal to the left of the sternum in the fourth intercostal space, and often an associated systolic thrill in this area. At the time of septal rupture the patient's condition deteriorates conspicuously; there is usually profound shock with peripheral circulatory failure and right heart failure. This complication of cardiac infarction seems to result from complete or almost complete infarction of the full thickness of the septal muscle. It seems that it is more likely to occur in the elderly hypertensive patient with advanced coronary arteriosclerosis who has suffered cardiac infarction during the previous fortnight. The prognosis seems to be uniformly poor. All the patients in this series died within a few weeks of septal rupture.

Tobacco as a Contributing Cause of Degenerative Coronary Disease. L. H. Sigler. New York J. Med. **55**:3107-3113 (Nov. 1) 1955 [New York].

Of 1,186 men and 334 women with angina pectoris and coronary thrombosis, 519 men and 292 women were nonsmokers, while 667 men and 42 women had been habitual smokers since early youth. The possible effect of tobacco in expediting the development of degenerative coronary disease in these 1,520 patients, 985 of whom were living and 535 were dead, was studied by a comparison of the age at onset of the clinical manifestations of the disease, the age at onset of coronary occlusion, and the age at death from coronary disease in nonsmokers and smokers. Clinical manifestations of coronary disease before 50 years of age developed in only 29.2% of nonsmokers among men and in 19.1% of nonsmokers among women, as compared with as many as 44.8% of smokers among men and 50.2% among women. The higher the degree of smoking, the earlier the onset of the clinical manifestations of coronary disease. The first attack of coronary occlusion before 50 years of age occurred in only 27.7% of nonsmokers as compared with as many as 42.9% of smokers among men, and in only 14.7% of nonsmokers as compared with as many as 58.3% of smokers among women. The higher the degree of smoking in both men and women, the earlier the occurrence of the first attack of coronary occlusion. In male smokers as many as 20.2% died before 50 years of age, while in nonsmokers only 6.4% died before that age. In women as many as 46.5% smokers and 5.6% nonsmokers died before 50 years of age. In both men and women the higher the degree of smoking, the earlier the occurrence of death. Several possible mechanisms may be considered as the underlying factors in the earlier degeneration of the coronary vessels in smokers. One is the effect of nicotine on the sympathetic nerve ganglions inducing recurring angiospasm of the coronary vessels. Another possible cause may be a metabolic upset resulting from the effect of nicotine on various other parts of the body. A third factor might be a very low-grade prolonged anoxemia resulting from the carbon monoxide of tobacco smoke. A fourth factor may be an occasional allergy to tobacco. Although the earlier appearance of clinical manifestations of coronary disease and of coronary occlusion as well as the earlier death from such disease in smokers, observed in the author's series, would appear to suggest that tobacco expedites the development of coronary disease, one must consider the fact that the differences in the number of smokers and nonsmokers in whom coronary disease developed were not marked. Tobacco may have some influence in expediting the development of coronary disease in a small proportion of the population, but certainly it is not the sole cause of coronary disease, even in those patients in whom it appears to be operative. The underlying causes in all patients are probably heredity, metabolic disturbances, abnormalities in the chemical composition of the blood, and physical, mechanical, and other unknown factors.

Bronchial Lavage for the Recovery of the Tubercle Bacillus: Comparison with Gastric Lavage and Laryngeal Swabbing. A. W. Lees, T. J. R. Miller and G. B. S. Roberts. Lancet **2**:800-801 (Oct. 15) 1955 [London, England].

Laryngeal swabbing, gastric lavage, and bronchial lavage were carried out in each of 144 patients in whom minimal, possibly active, pulmonary tuberculosis had been diagnosed as the result of routine radiography. It was thought that this type of case would provide a good test of the efficiency of the different methods, because experience has shown that it is here often difficult to recover tubercle bacilli, even when the tuberculosis is active. The technique of bronchial lavage was as follows: the patient sat in a chair; his tongue was held forward; he was instructed to keep breathing and to avoid swallowing; and 3 or 4 ml. of 1% amethocaine hydrochloride (Anethaine) with 1/10,000 Adrenaline was run over the back of the tongue, 1 ml. at a time, into the larynx from a 2 ml. syringe. After a few minutes the patient was tilted to the affected side, and 10 to 15 ml. of sterile physiological saline solution was similarly run over the back of the tongue into the larynx from a 20 ml. syringe to which a short piece of rubber tubing was fitted. The saline solution was coughed up from the bronchial tree, and the expectorated material was collected in a sterile basin, transferred to a sterile container, and sent to the laboratory for culture. The operator wore a gown and mask as in taking a laryngeal swab. In 35 of the 144 patients tubercle bacilli were obtained by one or more of the methods used. Bronchial lavage gave a positive result in 26 patients and gastric lavage in 14, and one or both laryngeal swabs (night and morning) gave a positive result in 8. Bronchial lavage was positive in 18 and gastric lavage in 6 cases when the other methods failed, and a laryngeal swab was positive in one case when the other methods failed. Bronchial lavage has the advantage over gastric lavage that it can be done in the outpatient department. But, as in laryngeal swabbing, the operator runs a risk of infection against which suitable precautions must be taken.

Clinical Investigations on the Effect of Penicillin-Sulfonamide-Combination-Preparations. W. Nissel. Wien. med. Wchnschr. **105**:840-843 (Oct. 15) 1955 (In German) [Vienna, Austria].

A combined preparation of sulfamethazine (Diazil) and penicillin was given to 40 patients with pneumonia, bronchitis, and cystitis, respectively. One tablet of the preparation contained 0.5 gm. of 4-6-dimethyl-sulfapyrimidine and 100,000 international units of penicillin. Four times from 5 a. m. to 9 p. m., the patients received two tablets two hours after the ingestion of food. This schedule made possible an eight-hour rest during the night. The duration of the treatment varied from six to eight days. Determinations of penicillin in the patients' serums were carried out two and three hours after the ingestion of the drugs. In most of the patients bacteriostatically effective concentrations were obtained with two tablets given every five to six hours. The clinical course and bacteriological examinations of sputum, urine, and stools of the patients showed the good effect of the preparation, which corresponded with the results of in vitro experiments. Patients with acute pneumonia and acute bronchitis showed an excellent response, although some of them had not responded to previous treatment with penicillin, streptomycin, or sulfonamides. Patients with chronic pneumonia and chronic bronchitis or with recurrences responded poorly or not at all. The combined preparation was definitely effective in all the patients in whom the disease was caused by pneumococci and streptococci, but results were not uniformly good in those caused by micrococci and enterococci. The patients with cystitis, including those with Escherichia coli as the causative agent, showed an excellent response. These results suggest that the sulfamethazine-penicillin preparation may be preferable to the broad spectrum antibiotics in many patients because of its economy, its bacteriostatic effect, and the range of its action. The author cautions against the prolonged use of the drug because of the risk of nonpathogenic bacteria becoming virulent as the result of a disturbance of the normal bacterial flora. Subfebrile temperatures were observed in some of the patients towards the end of the treatment, but these subsided after its discontinuation.

Lente Insulin in the Treatment of Diabetes. R. E. Slayton, R. E. Burrows and A. Marble. New England J. Med. **253**:722-725 (Oct. 27) 1955 [Boston].

Lente insulin has been used in the past two years by the authors in the treatment of 300 patients with diabetes mellitus. Results reported were obtained in special studies of 57 diabetic boys between the ages of 10 and 15 years at a summer camp in Massachusetts, and in 43 patients at the New England Deaconess Hospital. The effect of isophane (NPH) insulin and lente insulin was compared both in day-by-day maintenance studies and in tests involving the determination of the blood sugar level at frequent intervals over a 24-hour period. The insulin dose ranged from 12 to 68 units daily. The diet ranged from approximately 180 to 225 gm. of carbohydrate, 85 to 120 gm. of protein, 90 to 120 gm. of fat and 1,900 to 2,500 calories daily. Both at camp and in the hospital the usual daily program of the patient regarding diet and activity was not disturbed, and, in the studies comparing the effect of the two insulin preparations, comparable conditions were ensured. Lente insulin has a prolonged hypoglycemic effect, with a duration of action of approximately 24 hours. Its action closely resembles that of isophane insulin, and the two types may be used interchangeably. In an additional study, 40 boys with diabetes mellitus were given a combination of lente and crystalline insulin; on one day the two types of insulin were given by separate injections, and on another day they were placed in the same syringe and given in a single injection. Results showed that crystalline insulin may be given in a single injection with lente insulin just as with isophane insulin, with preservation of most of the rapid action of the unmodified type. This procedure is practicable and effective from a clinical standpoint. A few patients, particularly children, may complain of more discomfort at the site of injection with lente insulin than with other types of insulin. This is presumably due to the fact that with other types of insulin used in the United States the tricresol used as a preservative acts as a mild local anesthetic. In the lente insulin the preservative used is methylparaben, which is not anesthetic. Although allergic responses to lente insulin occur in certain patients, the authors' experience suggests that they are less frequent than those to other varieties of insulin.

Inhibiting Influence of Essential Hypertension on Malignant Growth and Rheumatoid Arthritis. S. G. Zondek. Acta med. scandinav. **152**:231-238 (No. 3) 1955 (In English) [Stockholm, Sweden].

People suffering from essential hypertension have been shown to have a lesser inclination than others to malignant growth, including leukemia. This negative relationship is more pronounced in men than in women. The strongly inhibiting influence of essential hypertension on malignant growth may make itself felt in women only in the 40 to 49 year age group and may be much weaker in the following decade; in men, however, it is operative even in the decade from 60 to 69. An additional difference is that certain malignant tumors in women, such as carcinoma of the breast and apparently also of the genital organs, are not affected at all, i. e., in these cases of malignancy the incidence of essential hypertension is more or less the same as its usual incidence in persons without cancer. The possibility that similar negative relationships might exist between essential hypertension and other chronic diseases was investigated in rheumatoid arthritis and diabetes mellitus, both of which are chronic conditions. A value of 160/90 mm. Hg was fixed as the upper limit of normal blood pressure, and only patients with pressures almost always exceeding this value were considered to have essential hypertension. The details of the investigation into a possible relationship between essential hypertension and diabetes are to be published elsewhere, but it may be said that essential hypertension exerts a synergistic effect on diabetes. This synergistic effect, however, is observed only in women and is not very pronounced even in them. The incidence of essential hypertension in patients with rheumatoid arthritis, on the other hand, is much lower than usual. Only 7 of the 95 patients aged 40 to 59 were hypertensive, an incidence of 7.3% instead of the usual incidence of about 20%, and in the 60 to 69 year age group, which contained 31 patients, only 7 again were hypertensive. The nature of the promoting factor or factors active in human cancer is not satisfactorily known, but it may be assumed that the metabolic (possibly hormonal) imbalance representing the background of essential hypertension is unfavorable for the action of this factor or factors, that is, people with essential hypertension may harbor an *inhibiting (antipromoting?)* factor. The promoting factor may be of a different nature in different types of cancer, and this may be the reason why essential hypertension does not exert an inhibitory influence on all forms of malignant growth. Both the promoting factor and the inhibiting factor or factors may be considered nonspecific in nature. This would explain why the cancer-inhibiting factor associated with essential hypertension may also exert either an antagonistic or a synergistic influence on other diseases. Similar properties are possessed by cortisone, and it may be that there is a structural relationship between this substance and the as yet unidentified agent active in essential hypertension.

Failure of Chemotherapy to Prevent the Bacterial Complications of Measles. L. Weinstein. New England J. Med. **253**:679-683 (Oct. 20) 1955 [Boston].

Secondary bacterial infection is the commonest complication of measles, and since the introduction of the sulfonamides these and other potent antibacterial agents have been used for the prophylaxis of the bacterial complications of measles. The author investigated the influence of chemotherapy given before hospitalization in the preeruptive and eruptive stages of measles (rubeola) on the number and type of complications present at the time of admission of patients to the hospital. For comparison, the course of untreated measles in the hospital was also studied, both in cases in which bacterial infection did not occur and in those in which it did develop and was treated with an antimicrobial agent. A total of 428 patients with measles was studied. Of 130 patients hospitalized after having received chemotherapy at home before the development of bacterial infection, 30.4% had secondary bacterial disease at the time of admission. This complication was present in only 15% of 298 cases in which no antimicrobial agent had been used before hospitalization. In 350 patients (256 received no drug and 94 were treated before hospitalization) not treated after admission to the hospital, rate of secondary bacterial infections was 4.6%. Hemophilus influenzae was the organism the most frequently responsible for secondary infection in patients who had received antimicrobial therapy; the pneumococcus, beta-hemolytic streptococci, Staphylococcus aureus, and H. influenzae were the most common etiological agents when drugs were not administered. Of 78 patients who received chemotherapy after entry to the hospital, a superinfection developed in 11% during the course of treatment. Despite the fact that the patients described in this paper are a somewhat selected group and represent only a fraction of cases of measles treated by physicians at home, the data presented strongly suggest that antimicrobial agents do not prevent the development of serious bacterial infection during the course of measles and that their use may actually be associated with an increased risk of development of this complication.

Clinical Experience with the C-Reactive Protein Test. R. J. Roantree and L. A. Rantz. A. M. A. Arch. Int. Med. 96:674-682 (Nov.) 1955 [Chicago].

Recently the detection of the C-reactive protein in human blood has been gaining attention as an index to inflammation or tissue destruction within the body. The C-reactive protein is a specific protein that has been crystallized. Present knowledge points toward its being a beta-globulin, probably bound to a lipid in the serum. The introduction of a commercial antiserum has made the detection of C-reactive protein a practical procedure for any laboratory. It is a simple precipitation reaction that could be done in the doctor's office. This study was undertaken in order to obtain information as to the value and limitation of the test when applied to general medical problems. The authors report experience with the C-reactive protein in 443 general medical cases and 50 normal controls. Some comparisons were drawn between the results of this test and the results of the erythrocyte sedimentation rate, leukocyte count, and temperature recordings in the same patients. The C-reactive protein was rarely present in the serum of a person in whom no inflammatory or necrotizing process could be found. It was consistently found in the serum of patients with bacterial infections, active rheumatic fever, acute myocardial infarct, and widespread malignant disease. It was commonly, but not as consistently, found in cases of active rheumatoid arthritis, virus infection, and active tuberculosis. It was rarely present in cases of limited primary carcinoma, uncomplicated chronic leukemia, multiple myeloma, or widespread superficial dermatitis. The C-reactive protein test gave fewer false-positive reactions than the other indexes of inflammation with which it was compared and, in general, gave a better positive correlation with inflammatory or necrotic processes. It did not give as good a positive correlation with active tuberculosis as did the erythrocyte sedimentation rate. A distinct advantage of the C-reactive protein test is that no interpretation of normal range is necessary. Any positive reaction may be considered abnormal.

Studies of C-Reactive Protein in Patients with Rheumatic Heart Disease: I. Lack of Correlation Between C-Reactive Protein and Aschoff Bodies in Left Auricular Appendage Biopsies. S. K. Elster and H. F. Wood. Am. Heart J. 50:706-714 (Nov.) 1955 [St. Louis].

The C-reactive protein, an abnormal protein not found in the serums of normal patients, appears as an acute phase response in various conditions such as trauma, infections, necrosis, neoplasia, and granuloma formation. It has been characterized as a beta globulin by free electrophoresis and is apparently combined with lipid in vivo. It is a very sensitive, though nonspecific, indicator of the disease activity in acute rheumatic fever and has been used as a guide in the treatment and management of patients. It has often proved more useful than other nonspecific indicators, such as the erythrocyte sedimentation rate or the white blood cell count. Some degree of correlation should therefore be discernible between the presence of C-reactive protein in the blood of patients undergoing commissurotomy for rheumatic mitral stenosis and the finding of Aschoff bodies in the left auricular appendages removed at operation if the existence of these bodies is an indication of acute rheumatic activity. Twenty such patients, aged 28 to 50, none of whom had overt acute rheumatic fever or even a suspicion of moderate rheumatic activity, were thoroughly studied in an attempt to correlate the C-reactive protein, as well as other clinical and laboratory tests for acute rheumatic fever, with the histopathological findings in the resected auricular appendages. The preoperative studies included appropriate roentgenographic, electrocardiographic, and cardiac catheterization determinations, in addition to the clinical examination. Each patient had a urinalysis, a complete blood cell count, erythrocyte sedimentation rate (Westergren method) and antistreptolysin-O determinations, and tests for C-reactive protein. Finger-fracture mitral commissurotomy was performed and the resected left auricular appendages were fixed in neutral Formalin solution and studied microscopically. Aschoff bodies were found in seven. No significant differences were detected between the patients with and those without Aschoff bodies in the appendage in regard to age, sex, duration of heart disease, fever, electrocardiographic abnormalities, white blood cell count, or erythrocyte sedimentation rate. The antistreptolysin-O titers were elevated in four of the patients with Aschoff bodies as compared with three of those without. No correlation was evident between the presence of C-reactive protein in preoperative blood specimens and that of Aschoff bodies in the auricular appendage. Only two of the seven patients with Aschoff bodies had C-reactive protein in their serum before operation, whereas it was present in four of the others. Lack of correlation between the C-reactive protein and the presence of Aschoff bodies in the auricular appendage may indicate that the pathological process is not sufficiently active to lead to the formation of this abnormal protein. The degree of rheumatic activity in cases in which Aschoff bodies are present but no C-reactive protein can be detected in the blood may have little or no clinical significance.

C-Reactive Protein in Serum of Patients with Leprosy. A. S. Rabson. Internat. J. Leprosy 23:155-161 (April-June) 1955 [New Orleans].

The author studied the levels of C-reactive protein in the serums of 100 patients with leprosy. It was hoped that the determination of the C-reactive protein might be of value in detecting the presence and degree of inflammatory response to Mycobacterium leprae infection. It was also hoped that this information might be of some prognostic importance or of aid in evaluating response to therapy. This abnormal protein was found in 37 of 47 patients with lepromatous leprosy classed as active, in 13 of 41 patients with apparently arrested lepromatous leprosy, and in 7 of 12 patients with tuberculoid leprosy. Discussing possible explanations for the absence of C-reactive protein in some of the active cases and its presence in some of the apparently arrested cases, the author suggests that some difference in host response may be involved, but long-term observations will be necessary to establish whether failure of the development of C-reactive protein has a favorable or an unfavorable prognostic significance. Since almost all of the patients in whom C-reactive protein failed to develop were receiving sulfone therapy at the time the serums were studied, the absence of the C-reactive protein may be an early manifestation of a favorable therapeutic response. This would be in accord with the disappearance of the C-reactive protein in patients with acute rheumatic fever during cortisone therapy. It is of interest that two of the patients with active lepromatous leprosy without C-reactive protein were under treatment with cortisone for erythema nodosum at the time the serums were collected. Only 16 of 41 patients with apparently arrested lepromatous leprosy had C-reactive protein, and a number of them had inflammatory diseases unrelated to their leprosy; in only 5 was it impossible to find an explanation for the presence of the C-reactive protein, but it is nevertheless possible that undetected foci of infection existed. The results in the 12 patients with tuberculoid leprosy are difficult to interpret. In all of the seven patients with C-reactive protein it was assumed that the disease process had been arrested, and in only two of these could an adequate reason for the C-reactive protein be found. Here again the possibility of undetected inflammatory foci of a nonlepromatous or of a lepromatous nature must be considered. With regard to the presence of C-reactive protein in 19 of 24 patients with leprosy and secondary amyloidosis, the author says that the relationship of C-reactive protein to amyloidosis is as yet unknown and merits further study.

Hydatid Cyst Associated with Goiter. E. Logaldo. Rev. Asoc. méd. argent. 69:256-258 (Aug. 15-30) 1955 (In Spanish) [Buenos Aires, Argentina].

Hydatid cysts in the thyroid gland are very rare. The Argentinean literature reports 13 cases. In none of those did the cyst develop on a hyperfunctioning nodular goiter. Sixty-eight cases of hydatid cysts were observed in the various departments of the Policlinico Provincial of Buenos Aires in the course of the last 13 years. The cysts were located in the lungs or in the liver in the majority of the cases, in some other structures in one or two cases, and in a nonhyperfunctioning thyroid gland in one.

The history of a patient in whom the hydatid cyst developed on a hyperfunctioning nodular goiter is presented. A woman 32 years old had five children. Pregnancy, delivery, and puerperium had been normal on every occasion. A small, asymptomatic goiter was observed on the left side of her neck while she was apparently in normal health. In three months the right side of the goiter rapidly grew to the size of an orange, producing marked symptoms of hyperthyroidism, without exophthalmos. The chest was normal on roentgen examination. The treatment consisted of administration of propylthiouracil in daily doses of 200 mg., hypertonic dextrose solution, sedatives, and C and B vitamins for three weeks, followed by discontinuation of the antithyroid treatment and administration of Lugol's solution for 10 days and an operation after that period. A preoperative diagnosis of thyroid hydatid cyst was not made. The operation consisted of a subtotal thyroidectomy, which brought rapid cure. Biopsy studies of the left half of the thyroid showed nodular goiter. Macroscopic study of the operative specimen and section of the specimen showed hydatid cyst occupying the whole right half of the thyroid gland with three daughter cysts in its cavity. The patient is in normal health four years after the operation.

Arthrogryposis Multiplex Congenita: Review of 54 Cases. J. H. Kite. South. M. J. 48:1141-1146 (Nov.) 1955 [Birmingham, Ala.].

The occurrence of congenital limitation of motion in several joints, associated with one or more congenital deformities, is described in 34 boys (63%) and 20 girls (37%). Motion in the shoulders was limited to less than a right angle in 22 patients, the elbow could not be extended in 22, and in 7 it was fixed in extension; the head of the radius was dislocated in 4 and the wrist was flexed in 31 and hyperextended in 3. The fingers showed many variations in the limitation of motion in the various joints. Twenty-three children showed dislocation of the hips. Motion was limited in the knees in 43 children. Of the 54 patients, 42 (76%) had clubfeet; the right foot only was clubbed in 6 patients, the left in 4, and both in 32. Nine children had a very severe bilateral flatfoot deformity, and six had a metatarsus varus type of deformity. Only 4 of the 54 children had normal feet. Two children, one girl and one boy, had arthrogrypotic mothers and one boy had an arthrogrypotic father. The family history of six children revealed ancestors with deformities. Two siblings, a boy and a girl, were arthrogrypotic, their father and mother being first cousins with no deformities on either side of the family for several generations. There were three sets of twins in the author's series, and in each case the twin was normal, while the one treated was a typical arthrogrypotic; one girl had a normal twin brother, one boy had a normal twin brother, and the third set were identical twin boys. Of the 54 arthrogrypotic children, 17 were first-born children, 10 were second-born, 7 third-born, 2 fourth-born, 4 fifth-born, 3 sixth-born, 2 seventh-born, 3 eighth-born, one ninth-born, and one tenth-born, and in the remaining 4 the order of birth was not known. Twenty-six children were full-term babies, 10 were premature, and in 18 there was no statement. The fairly typical syndrome of congenital limitation of motion in several joints associated with one or more congenital deformities is of unknown causation and has been a rare condition for the past 30 years, but there has been a sudden increase of this condition in the author's practice during the past year. With regard to heredity, the genetic theory is substantiated by the fact that three arthrogrypotic parents have had children with similar deformities. It is controverted by the fact that there were three sets of twins, one in each set normal and one arthrogrypotic. The arthrogrypotic was the first-born child in one-third of the author's cases. Only half of the babies were known to be full term. Arthrogryposis occurs more frequently in charity patients than in private practice. Correction of deformities lies in the orthopedic field.

Clinical Experiences with the Skin Biopsy Method of Detecting Chromosomal Sex. A. R. Sohval, J. A. Gaines and J. L. Gabrilove. Am. J. Obst. & Gynec. 70:1074-1082 (Nov.) 1955 [St. Louis].

A sex difference has been observed in intermitotic nuclear structure in the cells of various tissues and organs of numerous animal species and humans. A conspicuous mass of chromatin, termed sex chromatin, is found in approximately two-thirds of the cells of females. The sex chromatin is approximately one micron in size in human epidermal nuclei and is planoconvex with its flattened aspect in contact with the inner surface of the nuclear membrane. A smaller chromatin body, lacking the characteristic size and morphology of the female sex chromatin, may be encountered very infrequently (approximately 5%) in cells of males. The present study was undertaken in an effort to explore the usefulness of the skin biopsy method of chromosomal sex detection by applying it to individuals with sex hormonal disturbances, intersexual abnormalities, cryptorchism, and adrenocortical disorders. Sexually and hormonally normal males and females served as controls. The accuracy and relative simplicity of chromosomal sex detection by means of skin biopsy was confirmed in 28 male and 27 female patients who were sexually and hormonally normal. Studies of nuclear morphology in the skin of individuals with marked aberrations of sex hormonal status indicate the stability of the sex chromatin. These observations are consistent with the hypothesis that the characteristic chromatin body is derived from portions of the two X chromosomes of females and that it is not an index of sex hormonal function. The male type of epidermal nuclear structure was encountered in a patient with ovarian agenesis (Turner's syndrome), in one with male pseudohermaphroditism, and in another with either male pseudohermaphroditism or true hermaphroditism. The chromosomal sex corresponded to the apparent genital sex in a boy with unilateral uncomplicated cryptorchism, in a man and a woman with adrenal cortical hyperfunction (Cushing's syndrome), and in a man and a woman with adrenal cortical hypofunction (Addison's disease). These studies support the view that the identification of chromosomal sex by the skin biopsy method is helpful in the differentiation between female and male pseudohermaphroditism.

An Epidemic of Histoplasmosis in Warrenton, North Carolina. T. Parrot Jr., G. Taylor, M. A. Poston and D. T. Smith. South. M. J. 48:1147-1150 (Nov.) 1955 [Birmingham, Ala.].

An epidemic of histoplasmosis that occurred in Warrenton, N. C., in May, 1947, was thought to be an outbreak of ornithosis because of the association with pigeons that used the belfry of an old church for roosting and nesting. A contractor and six workmen entered the belfry for the purpose of reconstruction. It was estimated that there was about one-half ton of pigeon feces deposited on the floors. Some squabs were removed by the workmen and, according to reports, consumed by them and their families. The contractor and the six men became ill 12 to 14 days after their exposure to the dried pigeon feces. All had symptoms described as characteristic of influenza. All attempts to isolate a causative agent failed, and the patients recovered in from one to four months and remained well. Five years later, one of the patients, who had been most severely ill, had a routine chest roentgenogram made, revealing hundreds of small calcified nodules of the type commonly observed in healed primary histoplasmosis. When restudied, six of the seven original patients had positive skin tests to histoplasmin and five showed calcified spots in the lungs. Serums from the acute and convalescent phases of the disease were available from four patients, and these revealed complement-fixing antibodies to Histoplasma capsulatum. The occurrence of an epidemic of histoplasmosis in a nonendemic area should remind one of this disease in differential diagnosis under certain circumstances.

SURGERY

Mitral Valvotomy: A Follow-up of 45 Patients for Three Years and Over. C. Baker, R. Brock and M. Campbell. Brit. M. J. 2:983-991 (Oct. 22) 1955 [London, England].

Of 31 women and 14 men with mitral stenosis, the first 45 patients who survived mitral valvulotomy at Guy's Hospital in London, England, 20 were in the preoperative state of total incapacity (grade 4), 24 in that of gross disability (grade 3), and one in that of moderate disability (grade 2). All of these patients were followed up for three years and some for up to six years. The first assessment of the patients' state was made one year after the operation, when 21 patients had obtained excellent results (3 or more grades of improvement), 17 good results (2 grades of improvement), 5 fair results (1 grade of improvement), one poor results (no improvement), and one patient had died; thus results of operation were satisfactory in 38 patients and disappointing in only 7. During the second postoperative year 6 patients deteriorated, and at the end of three years 11 of the 38 patients had joined the disappointing group, leaving 27 with good or excellent results. The third year after the operation is evidently more critical than the first two years, but some patients who were followed for four and five years maintained their improvement and were leading active lives. Results after three years were much better in those who were graded as excellent than in those who were graded as good some months after operation, showing that this clinical judgment was in general a valid one for the future. The size of the heart, the degree of disability, and the presence of atrial fibrillation before the operation did not seem to influence the result in this three-year period, but they will do so in the long run. Measurement of the valve at operation showed that the results were better in those cases in which it was less than 1 cm. in diameter. Patients in whom the surgeon found it impossible to produce an opening that was as large as 2 cm., or in whom there was gross incompetence, did not obtain good results. Of 18 patients in whom a full opening or one over 3 cm. was produced by surgery, 17 obtained good results and only one poor results. Mitral regurgitation before valvulotomy reduced the ratio of good results and increased that of only fair results. There was a close association between calcification of the valve and regurgitation. There was not a single case in which a successful valvulotomy failed to reduce pulmonary hypertension, and, in general, the greater the degree of pulmonary hypertension, the better the chance of a good result. In three patients atrial fibrillation occurred after operation and normal rhythm could not be restored; the condition of all three patients was poor but their number was small. Fourteen of the 18 patients who had fibrillation preoperatively maintained good or excellent results and thus did better in maintaining the improvement gained by valvulotomy than those who had normal rhythm before the operation. Loss of improvement from operation when atrial fibrillation occurred later indicated that the margin of benefit conferred was not great and suggested that the valve had restenosed. There was no correlation between the presence or absence of Aschoff bodies in the auricular appendage and the clinical evidence of rheumatic activity and the subsequent course of the patients. There was evidence in three patients, of whom one died and two had second operations, that there was some restenosis of the valve, which was more likely due to further rheumatic infection than to fibrosis from stress. By comparing in some detail the patients who have maintained their good results with those who have lost them, it appeared that, although at first the patient's symptoms and increased capacity are more important than any diminution in the physical signs, the latter give a better indication that the good results are likely to be lasting, and improvement in the electrocardiogram or roentgenogram is also of value. One can say that 2% of the authors' patients lost all their improvement in the first year, 6% in the second year, 10% in the third year, and perhaps 15% in the fourth year. It is unlikely that improved selection and improved surgery will ever prevent some progressive deterioration, for valvulotomy is performed on a heart that has been damaged by rheumatic infection. But, although some patients have not maintained their initial improvement, even these have had the benefit of increased or normal activity for one year or more. That second operations can be done on some patients if restenosis occurs emphasizes the need for a thorough follow-up.

Systemic Embolism and Left Auricular Thrombosis in Relation to Mitral Valvotomy. J. R. Belcher and W. Somerville. Brit. M. J. **2**:1000-1003 (Oct. 22) 1955 [London, England].

Of 430 patients on whom mitral valvulotomy was performed, there was a history of systemic embolism before the operation in 54 (13%). Comparison of these 54 patients with 200 consecutive patients without embolism who had mitral valvulotomy revealed that the patients with embolism differed from those in the control group in that the average age at operation was higher, the sex incidence was less predominantly female, atrial fibrillation was more common than sinus rhythm, dyspnea was less severe, the left auricular appendage was larger, and the incidence of mitral incompetence was slightly greater. Five (9%) of the 54 patients with preoperative emboli had a further embolic incident at or after valvulotomy. At operation 68 patients (16% of the 430) had a thrombus in the left auricular appendage, and embolism developed in 11 of these (16% of the 68) during or after operation. Systemic embolism was closely related to mitral valvulotomy in 24 (6% of the 430 patients): it occurred during operation in 17, within a few hours in 2, and within 15 days in 5. Late emboli occurred in four patients: after seven weeks in one, after one year in two and after 16 months in one. Of the 24 patients, 5 (21%) had a history of preoperative embolism. Thrombosis of the left auricular appendage could not be diagnosed before operation. In general it was observed more often in male patients with atrial fibrillation and mitral calcification. It was more than twice as common (30%) in patients with a history of previous embolism as in those without such a history (13%) and was present in almost two-thirds of those in whom an embolus developed at operation. Embolism was observed more than twice as often when a fresh "red" thrombus had occurred as when a "gray" thrombus had been formed. A successful valvulotomy will not prevent further systemic embolism, but there is reason to believe that it will reduce its incidence.

Surgical Procedure for Coronary Arterial Disease. D. S. Leighninger and C. S. Beck. Angiology **6**:395-402 (Oct.) 1955 [Baltimore].

A surgical procedure, known as the Beck 1 operation, was practiced in 88 patients with coronary arterial disease. It consists of the following steps: mechanical abrasion of the epicardium and the cardiac surface of the parietal pericardium, application of an inflammatory agent (0.2 gm. of powdered asbestos) to the surface of the heart, partial ligation (3 mm.) of the coronary sinus near its ostium into the right auricle, and application of tissue grafts (the abraded pericardium and vascular mediastinal fat) to the surface of the heart. Mechanical abrasion of the epicardium produces a mild inflammatory reaction, which is a stimulus to the growth of intercoronary arterial communications. It also removes the epicardium as a mechanical barrier to the growth of extracoronary arterial communications from the abraded pericardium and vascular mediastinal fat into the myocardium. The inflammation resulting from the asbestos powder is also a stimulus to the growth of intercoronary communications. The application of tissue grafts to the surface of the heart provides for the possible growth of extracoronary communications. Ligation of the coronary sinus provides for greater extraction of oxygen from blood in the capillary bed and also stimulates the development of intercoronary communications. Thus the major benefit from this surgical procedure is stimulation of growth of intercoronary communications, which bring additional small but important quantities of blood to the ischemic myocardium and prevent the development of an oxygen differential. This additional blood saves life and saves the myocardium from degeneration. There were seven operative deaths (an operative mortality of 8%); two of the seven deaths resulted from thoracotomy alone, and five patients died postoperatively before their discharge from hospital. Since discharge from the hospital, only two patients died, a late mortality rate of 2.3%. The more important component of the so-called operative mortality was the disease rather than the surgical procedure. Surgical intervention relieved symptoms to a significant degree in 9 out of 10 patients. The trend of the authors' experience seems to indicate that this surgical procedure prolongs life. There is no experimental evidence to indicate that medical therapy adds a single drop of blood to ischemic areas of myocardium. In view of this limitation, together with the evidence of benefit from and safety of the surgical procedure described, the patient with coronary arterial disease should be informed that there is a method of treatment more effective than rest and limitation of activity. The Beck 1 operation should be done early in the course of disease, before a fatal oxygen differential or before irreparable damage to the myocardium occurs.

Contribution to Early Diagnosis of Pulmonary and Bronchial Carcinoma. H. Schmidt. München. med. Wchnschr. **97:**1349-1351 (Oct. 14) 1955 (In German) [Munich, Germany].

Of 30 patients operated on for carcinoma, 8 were subjected to pneumonectomy and 15 to lobectomy. In the remaining seven patients, thoracotomy revealed that pneumonectomy, although technically feasible, would have been an immediate threat to the patient's life and would not have made its prolongation possible; pneumonectomy, therefore, was not performed. There were no operative or early deaths. An early diagnosis was made in only 7 of the 23 patients on whom resections were performed; in the 16 other patients the diagnosis had been delayed until the time of operation for from six months to one and a half years. In the seven patients in whom surgical intervention was limited to thoracotomy, the diagnosis was delayed up to two years. Carcinoma had either been mistaken for tuberculosis or had remained concealed by atypical secondary pneumonias. Of the 23 patients who underwent resection, 10 had pulmonary carcinoma and 13 had bronchial carcinoma. Early clinical and roentgenologic manifestations of pulmonary and bronchial carcinoma are highly atypical. The following rules should be observed to further early diagnosis and early surgical intervention. 1. Solitary pulmonary foci should be removed by resection, although they may show only little increase in size and although definite differentiation from active tuberculoma may not be possible. 2. Bronchography should be performed in the search for bronchial tumors in all patients with atypical bronchopneumonia, pneumonia, pleuropneumonia, lung abscess, or pulmonary gangrene in whom complete restoration to normal does not occur or who have recurrences. 3. All fresh, apparently tuberculous processes with involvement of hilus in male patients, without any demonstration of bacilli or with a single demonstration, must be suspected to be tumors, and bronchograms are, therefore, indispensable. The observation of acute atelectases in cases of this type is pathognomonic of bronchial carcinoma. In cooperation with special clinics one must attempt clarification, without a prolonged observation period, in all cases in which carcinoma is suspected. Excellent results may be obtained from early surgical intervention consisting of lobectomy rather than pneumonectomy. Operative and early mortality rates associated with pulmonary resection need not exceed those of gastric resection. Today the approach to the lungs and bronchi for diagnostic purposes is easy and may be of considerable aid in giving malignant lesions of the lung first place for surgical intervention among those of all the other internal organs.

Dangers and Management of Retained Tracheobronchial Secretions. H. T. Ransdell Jr. Am. Surgeon **21:**1001-1007 (Oct.) 1955 [Baltimore].

There are patients who literally drown in their own tracheobronchial secretions. Normally these secretions are eliminated by ciliary action and by cough. If anything interferes with this elimination, e. g., impairment of the cough reflex or ciliary action, these secretions dam up with resulting obstruction of the airway, atelectasis, hypoxia, pneumonia, and death. Factors responsible for excessive tracheobronchial secretions and their retention are: aspiration of oral and pharyngeal secretions; chronic bronchitis (often secondary to heavy smoking) and mild bronchiectasis; inability of the patient to cough and expectorate; unconsciousness of patient as with narcotics, anesthetic agents, and coma or comatose states; ineffectual cough due to pain or tight abdominal binders; tenacious secretions; paradoxical motion of chest or mediastinum as with thoracoplasty, multiple rib fractures, and sucking wounds of the chest; semi-Fowler's position, which favors collection of secretions in the bases of the lungs; and atelectasis. The most important symptom of retained tracheobronchial secretions is a relatively unproductive, wet, "rattly" cough. With more advanced bronchial obstruction, dulness, diminished breath sounds, and fremitus usually are present. Rhonchi detectable by stethoscope usually are a late or pneumonic expression of retained secretions. Roentgenograms often are of great help and suggest retained secretions if the lungs appear poorly aerated and if atelectasis is demonstrated. Patients should be trained to cough. During major surgery an endotracheal tube should be used to facilitate aspiration of secretions and, before the patient is removed from the table, all pharyngeal and tracheobronchial secretions should be removed. The patient is encouraged to cough at least every hour during his first 24 to 48 hours after operation and at gradually increasing intervals thereafter. His position is changed, side to back and back to side. As soon as possible, the patient should be gotten out of bed and encouraged to walk. The following aids facilitate coughing: several deep breaths or a little swallow of water just prior to coughing, support of the operative incision during the coughing either by the attendant or the patient himself, and having the patient sit up while coughing. Inhalation of high humidity atmosphere for 20 to 30 minutes, three or four times daily, is helpful in thinning or preventing drying of the secretions and thus making them easier to cough up. Ammonium chloride, in 1 gm. doses every two to four hours, is very helpful in this respect. Bronchoscopy and tracheobronchial catheter aspiration is necessary in patients unable to remove their tracheobronchial secretions. Hardly anything is more gratifying than to see a cyanotic moribund patient with the "death rattle" clear his cyanosis, reaerate his lungs, return to consciousness, and start on the road to recovery from an apparently hopeless situation, within 10 to 15 minutes after aspiration of his tracheobronchial secretions.

Contribution to Prophylactic Hormone Therapy with Testosterone in Mammary Carcinoma. G. Buttafarri. Riforma med. **69:**1022-1026 (Sept. 10) 1955 (In Italian) [Naples, Italy].

Testosterone administered to patients with cancer of the breast treated surgically retarded the fatal progression of the disease and prevented the onset of early relapses and metastases. Buttafarri used the hormone therapy for 20 patients in the 35 to 45 year age group. After a radical mastectomy with dissection of the axilla had been performed and the operative wound had healed, the patients were given roentgen irradiation to the ovaries on two anterior and posterior fields centered around each ovary. A total of 600 r was given to each field. One month later, testosterone therapy was begun with a test dose of 50 mg. weekly for three weeks, followed at first by a dose of 50 mg. every other day for one year and then by a maintenance dose of 250 mg. every two weeks for the following years. A follow-up could be made of 11 patients, some of whom are still living and receiving the hormone 6 to 10 years after the operation; the others in whom the radical intervention was performed in 1950 are also still continuing the therapy. All are euphoric and show a marked improvement in general condition, gain in body weight, and a greater work endurance. Despite the large doses of testosterone, virilizing side-effects were never too marked. In a few instances they were decreased by substituting the hormone with methylandrostenediol. Because testosterone therapy did prolong the survival time of his patients, the author feels that it should be used more extensively for patients with breast cancer after they have undergone a radical mastectomy.

Intermittent Claudication and Sympathectomy. G. E. Mavor. Lancet **2:**794-796 (Oct. 15) 1955 [London, England].

In limited occlusion of the main vessel of the lower limb secondary to atheroma, the collateral circulation forms an adequate bypass returning a distal pulse to the main vessel. The resting nutritional needs of the limb are met, and symptoms are limited to periods of exercise. The classical exercise symptom is intermittent claudication, with pain in the calf muscles. With propagation of the main-vessel thrombosis to involve both femoral and popliteal arteries in continuity, rest pain and ischemic changes in the foot arise, but intermittent claudication remains the dominant complaint in half the cases. Until recently the treatment of intermittent claudication with pain in the calf has resolved itself into lumbar sympathectomy. However, it has always been questionable whether this operation is worth while in the treatment of exercise pain itself. With the recent advent of direct surgery for the occluded artery, the value of sympathectomy demands reexamination. The author studied the effect of lumbar sympathectomy on intermittent claudication in 54 patients, in whom the exact site and extent of the main-vessel occlusion, secondary to atheroma, was known. No patient was completely relieved of exercise pain in the calf.

Only 9 of the 54 patients had a significant improvement in exercise pain, meaning that the patient's activities as regards work and pleasure were favorably affected. The remaining 45 patients were either improved to an insignificant degree, unaltered, or made worse by the operation. The author concludes that lumbar sympathectomy is not worth while in the treatment of intermittent claudication itself. Where direct surgery is contemplated in cases of segmental main-vessel thrombosis in the lower limb, sympathectomy may be postponed until such time as its effects will be more obviously beneficial. A possible exception may be popliteal occlusion.

The Lumbar Intervertebral Disc Disease Syndrome: Clinical Correlation of 175 Cases. W. E. Stern. West. J. Surg. **63:**647-653 (Oct.) 1955 [Portland, Ore.].

Of 175 patients with the clinical syndrome of lumbar intervertebral disk disease who were operated on, the clinical diagnosis was confirmed by surgical intervention in 163, while in 12 no intervertebral disk disease was found on operation. The most frequently occurring clinical findings in these 175 patients were correlated with the operative findings in an effort to determine the presence or absence of a common denominator by which more accurate diagnoses may be made. Most of the patients had back pain, leg pain, limitation of back mobility, limitation of straight leg raising, and neuroparalytic phenomena. Almost every patient who did not have two or more of these major physical findings or a clear history thereof showed findings of sufficient value to permit diagnosis. However, the results of the clinical examination did not make it possible to distinguish with certainty between those 156 patients in whom surgical intervention revealed root compression from a diseased disk and those 6 patients who had root compression from other causes. It was also impossible to separate the 7 patients who had the syndrome of back and leg pain but in whom root compression was not found on surgical intervention from those 156 who did have root compression. The statement seems justified that rarely has the diagnosis of herniating intervertebral disk been made in the absence of back or leg pain, or a clear history thereof, as well as evidence of some nerve root involvement as detailed by deficiency of function or aggravation of symptoms by nerve root stretch. Myelography was used as an adjunct in diagnosis and was performed in all but one patient. There were two false-positive myelograms unassociated with disease at a given level. Negative studies were more frequent. Conservative treatment with bed rest is recommended for the initial attack of lumbar intervertebral disk disease as well as recurrent attacks, if widely separated by months or years. Lack of response to conservative management during the initial attack, frequent recurrent attacks despite adherence to prophylactic measures, and the development of prominent neuroparalytic phenomena are indications for surgical correction and relief.

The Management of Esophageal Varices in Cirrhosis of the Liver in the Absence of Gastrointestinal Hemorrhage. I. B. Brick and E. D. Palmer. South. M. J. *48:*1021-1023 (Oct.) 1955 [Birmingham, Ala.].

Esophagoscopy by means of a semi-flexible instrument with a telescopic attachment giving four diameter magnification was used by the authors in patients in whom hepatic cirrhosis had been confirmed by histological examination of the liver. They found many more cases of esophageal varices than they had suspected clinically or than could be found by x-ray study. One hundred sixty-one patients with varices were found in 238 cases. Only 74 of these patients had a history of hemorrhage, leaving 87 cases in which no hemorrhage had occurred. There is nearly unanimity of opinion that portal decompression by either portacaval or splenorenal shunt is indicated in patients with esophageal varices and cirrhosis in whom there has been a hemorrhage. Because of their endoscopic studies the authors were confronted with the problem of deciding how to manage a sizable group of patients with esophageal varices that had not bled. They performed decompression procedures in 50 of the 161 patients with esophageal varices. These 50 included 18 who had never had bleeding. Five of these 50 patients died during the first 18 postoperative weeks, 4 from liver failure and one from acute cardiac failure with pulmonary edema, making a mortality rate of 10%. In the same period of observation in the untreated group, there were eight deaths as a result of the first gastrointestinal hemorrhage. Seven others died as a result of second, third, or fifth hemorrhage. With the passage of time the favorable results of such treatment will become even more obvious in comparison with the untreated group. The authors are of the opinion that the presence of esophageal varices in the absence of a history of gastrointestinal hemorrhage is a relative indication for surgical portal decompression in the cirrhotic patient.

Minimization of Risk and Disability in Idiopathic Ulcerative Colitis. C. Dennis and K. E. Karlson. Am. J. Surg. **90:**761-766 (Nov.) 1955 [New York].

In an earlier report on 267 patients with ulcerative colitis seen at two hospitals prior to 1951, the authors stated that, of the group treated conservatively or with emergency surgery only, 7.7% of those followed were found living and well at the end of the follow-up period, while of the group treated with elective operation, 72.8% of those followed were found living and well. The authors comment on cancer as a complication of idiopathic ulcerative colitis, on types of surgical interventions, on the prognosis of patients who have undergone total colectomy and ileostomy for idiopathic ulcerative colitis, and on proper surgical technique for ulcerative colitis. The prognosis is much better with appropriate surgical management than with any other plan of therapy. In patients with idiopathic ulcerative colitis of several years' standing, the risk from total colectomy and ileostomy is definitely smaller than the risk of death from carcinoma as a complication of colitis. Transthoracic vagotomy may lead to deferral of colectomy for a variable period of time, but it appears to be indicated only in patients in whom lesions persist in the small intestine after they have undergone colectomy and ileostomy. As regards survival, the late prognosis of patients subjected to ileostomy and total colectomy is no worse than that of the general population; in terms of morbidity it is somewhat less favorable, but it is immensely superior to that of ulcerative colitis patients not subjected to ileostomy and colectomy. The surgical management of idiopathic ulcerative colitis demands a clear understanding of the factors related to a good ileostomy and meticulous attention to details. There is no excuse for impairment of sexual power in connection with the removal of the rectum for uncomplicated idiopathic ulcerative colitis.

Rectal Biopsy as an Aid in Hirschsprung's Disease. O. Swenson, J. H. Fisher and H. E. MacMahon. New England J. Med. **253:**632-635 (Oct. 13) 1955 [Boston].

The authors advocate rectal biopsy as an aid in cases in which the diagnosis of congenital megacolon (Hirschsprung's disease) proves difficult. The indications for rectal biopsy are demonstrated on the basis of the histories of 4 patients with congenital megacolon who were selected from 169 patients with this defect. The first case demonstrates that, when the colon has been deactivated for 6 or 12 months by a colostomy, the typical x-ray findings of a dilated colon, with a narrow distal segment, are no longer present. Rectal biopsy is helpful in making a definite diagnosis in such situations. In the newborn infant the diagnosis of congenital megacolon is difficult to establish, because the colon, particularly if a long segment is involved, does not become dilated and hypertrophied until the intestinal tract has been functioning for several months. In infants whose whole colon is aganglionic, symptoms of obstruction of the upper large intestine develop soon after birth, yet a barium enema reveals no obstruction of the large intestine. In such a case a biopsy specimen without ganglion cells elucidates the cause of the obstruction. Patients with a short lesion of congenital megacolon are a third group in which biopsy is useful. In these cases the lesion is so low that the radiologist is not able to demonstrate a narrow segment extending through the rectosigmoid. Failure to find ganglion cells in the biopsy specimen will establish the diagnosis. A fourth indication for biopsy concerns patients who may have diarrhea, episodes of intestinal obstruction, or other symptoms of colonic dysfunction instead of the usual picture of chronic constipation. The authors perform rectal biopsy under general anesthesia. The anus is dilated and a 1 cm. longitudinal incision is made through the mucosa on the side of the anal canal, beginning at the white line of Hilton, and extending up between the columns of Morgagni. By means of blunt dissection the mucosa is readily separated from the internal sphincter and rectal wall. The internal sphincter is a white, firm muscle band. A 5 to 10 mm. segment of this muscle is excised, extending from the internal sphincter into the rectum. Since the ganglion cells are between the circular and longitudinal layers, both must be included in the biopsy. Bleeding should be controlled with fine chromic catgut sutures placed along the cut edges of the mucosa. The incision is left open to prevent infection. The specimen is fixed in Formalin and multiple sections are examined for ganglion cells. If these are not found, the diagnosis of congenital megacolon is established. In control material from 10 cadavers with normal colons, ganglion cells were found. Severe bleeding in one child was the only complication in 40 patients in whom rectal biopsy was done to establish the diagnosis of congenital megacolon. In 19 of these this diagnosis was verified, because no ganglion cells were found. The specimens from the other 21 patients contained ganglion cells, and the success of subsequent conservative management confirmed the diagnosis of chronic constipation.

The Human Bite. G. R. O'Brien, J. L. Kostecki and H. Colberg. New York J. Med. 55:2943-2944 (Oct. 15) 1955 [New York].

Ten persons between the ages of 13 and 46 years had injuries of the lip, nose, cheek, ear, or forehead caused by human bites sustained when fighting or in passionate lovemaking. Two patients were men and eight women; three were white and seven Negro. Each was given 1,500 units of tetanus antitoxin and large doses of penicillin, usually 100,000 units every three hours. The methods of repair varied according to the extent of the avulsed area, its location, and its depth. If the defect was not too extensive a "V" excision was performed with primary closure; if the defect involved the lip, as it did in three of the patients, mucosa and skin below the vermilion border were included. If the defect was mucosal and rather long in extent, a mucosal flap was advanced from within outward (lipshave type) along the vermilion border. The defect occasionally was allowed to scarify, and then secondary repair by one of the accepted methods was performed. Patients whose wounds closed primarily required an average of 2 days of hospitalization, while those with delayed or secondary repair of wounds required an average of 15 days of hospitalization. Results showed that, with the use of antibiotics in large doses, primary closure or immediate coverage by skin graft or mucosal flap is possible without fear of complications. There were no complications except in one patient in whom an iodine burn developed as a result of application of iodine by the patient's mother, before hospitalization. The end-results were very good as a rule. In none of the patients was the use of cautery entertained, and the authors believe that it is not necessary to cauterize these wounds.

The Results of Surgical Palliation in 32 Patients with Transposition of the Great Vessels. T. O. Murphy, V. Gott, C. W. Lillehei and R. L. Varco. Surg. Gynec. & Obst. 101:541-544 (Nov.) 1955 [Chicago].

Two of the authors, Lillehei and Varco, found that of 114 patients with complete transposition of the great vessels (pulmonary artery and aorta) only 4% were alive at 7 years of age, and 78% had died during the first year of life. It is obvious, therefore, that, if any surgical intervention is to be carried out, it must take place at an early age and at the first signs of deterioration of the general condition of the patient. The authors attempted surgical palliation of complete transposition in 32 patients between March, 1952, and January, 1955. Twenty-two were operated on during the first year of life, 17 of them during the first six months. Complete transposition of the great vessels cannot exist as a pure form of congenital heart disease, for it is incompatible with life; some sort of an intracardiac shunt is necessary to allow mixing of the otherwise isolated pulmonic and systemic circulatory systems. Sixteen of the 32 patients had interventricular septal defects, 11 had patent ductus, 10 had interatrial septal defects, 10 had patent foramen ovale, 6 had pulmonary stenosis, 5 had overriding pulmonary artery, 3 had overriding aorta, 2 had hypoplastic aorta, 2 had coarctation of the aorta, and the following defects were found in one patient each: hypoplastic pulmonary artery, hypoplastic right ventricle, levocardia, and bicuspid pulmonary valve. The following types of surgical procedure were attempted. The establishment of a venous shunt to the systemic (right) atrium by means of transplanting the right pulmonary vein was attempted in 10 patients, and a further attempt at correction by also transplanting either the superior or inferior vena cava to the pulmonic (left) atrium was attempted in 13 more patients. In six instances, in which stenosis of the pulmonary artery was present, either a Blalock or a modified Potts procedure was done to establish systemic arteriolization of the pulmonary vascular bed. In one patient, an attempt was made to repair a coarctation of the aorta and to ligate a patent ductus. In two instances, the patient expired before any procedure other than a thoracotomy could be done. Twenty-five of the patients died during or after surgical treatment. The seven survivors have been followed from 15 to 36 months since surgery. They have all gained weight and approach a more normal existence. Several of these children have rather suddenly learned to walk after recovering from the surgical procedure. The degree of cyanosis is definitely lessened, although they still show mild cyanosis with exertion. Even though surgery in this group of patients carries with it a high mortality, the seven surviving patients are representative of a salvage beyond that to be expected from the natural history of this crippling lesion. Four of these seven survivors were critically ill at less than 2 months of age, when the surgery was performed. The authors continue to hope that newer cardiac bypass techniques will permit complete correction.

Mitral Commissurotomy: Study of 400 Cases. F. d'Allaines and P. Blondeau. Presse méd. 63:1361-1364 (Oct. 15) 1955 (In French) [Paris, France].

Mitral commissurotomy was performed in a series of 400 patients at the Hôpital Broussais, Paris, France. Seven patients died on the operating table and 22 within the first two postoperative weeks, making the mortality rate about 7%. This rate has remained fairly constant over the past four years because, as the authors improve the technique of the operation, they operate on patients in more and more serious conditions. All survivors have been followed up for at least six months, and two-thirds of this number have obtained good or excellent results. Experience has taught the authors that patients who show no impairment of function should not be operated on. The indications have been gradually broadened to include patients over 50 years of age; those with mitral stenosis combined with right ventricular insufficiency, even if advanced; and those with polyvalvular lesions in whom mitral stenosis dominates the clinical picture. Slight fever, complete arrhythmia, and peripheral embolism are not contraindications to commissurotomy. The coexistence of mitral insufficiency presents a problem of indication that must be decided on the basis of clinical roentgenographic, and electrocardiographic evidence and operative studies of left ventricular pressure. At operation on any patient with mitral stenosis, if the auricle should prove to be too small, the surgeon should go directly through the atrium. Thrombosis of the auricle is easy to treat, but not so that of the atrium. The commissurotomy should be large. The authors prefer a mitral dilator devised by Charles Dubost; this instrument is dangerous in inexperienced hands. The electrocardiogram taken during operation allows of anticipating cardiac disturbances. Excitable hearts can be protected against disorders of rhythm. The result obtained can be judged by left atrial and ventricular pressure readings taken at operation.

Our Present-Day Orientation in Treatment of Malignant Tumors of Middle and Upper Esophagus. A. M. Dogliotti and A. Actis-Dato. Minerva med. 46:451-453 (Sept. 1) 1955 (In Italian) [Turin, Italy].

The authors' conservative treatment for cancer of the middle and upper esophagus consists in introducing into the esophagus a thin polyethylene tube containing radium needles, which, by exerting traction on the tube, are placed at the height of the diseased area of the esophagus. One end of the polyethylene tube projects from the patient's nose, the other protrudes from a temporary gastrostomy through which the patient is fed during the in loco treatment period, which varies from three to six days depending on the patient's tolerance. The tube is then removed, and the esophagus is dilated on the following days with special dilators of progressively increasing size that are passed over a nylon thread guide. The passage of these dilators is greatly facilitated because of the earlier radium treatment, which causes extensive and marked degeneration and necrosis of the cancerous tissue. A second treatment with radium can be repeated, if needed, after 10 days. Fifteen days later the gastric fistula is closed and the patient is able to eat. The authors used this treatment for 22 patients in extremely poor general condition who had cancer of the middle and upper esophagus. The patients have survived the operation for from a minimum of eight months to a maximum of more than three years. Some patients in whom the neoplasm produced restenosis were given the treatment again six to eight months later with good functional results. Roentgen therapy is indicated for those patients whose roentgenograms show, after the radium treatment, extensive diffusion of the neoplasm to the mediastinum, pulmonary hili, or areas far removed from the esophagus on which the radioactive treatment could not exert its action. A radical operation is performed by the authors only in those patients in whom a neoplasm of the middle and upper esophagus has not as yet invaded the nearby organs and in those with cancer of the lower third of the esophagus before regional metastases have taken place.

Bilateral Adrenalectomy in the Treatment of Cancer of the Breast. T. L-Y. Dao and C. Huggins. A. M. A. Arch. Surg. 71:645-657 (Nov.) 1955 [Chicago].

There is evidence that alteration in endocrine balance can produce effective palliation in many cases of mammary cancer. Laboratory studies carried out by the authors demonstrated that both the adrenal cortex and the ovary are capable of secreting hormones that can sustain the growth of mammary cancer. These considerations led to bilateral adrenalectomy and oophorectomy for human breast cancer. Bilateral adrenalectomy alone or in combination with oophorectomy was performed at the clinic with which the authors are connected in 175 patients (173 women and 2 men) with metastatic cancer of the breast since May, 1951. The first 100 consecutive cases are reviewed in this report. The initial operative mortality of 5% has now been reduced to 1.4%. There has been no death in the last 65 cases. The hormonal substitution regimen employed provided adequate replacement. No postoperative death could be attributed to adrenal insufficiency. Adrenalectomy induced significant and prolonged regression of extensive mammary cancers of women who had not responded to earlier treatment with testosterone, estrogen, oophorectomy, and irradiation of the ovaries. Six patients with widely disseminated mammary cancer experienced profound regression of the cancer, which has persisted more than 30 months; one women who had a rapidly advancing mammary carcinomatosis is in good health 49 months after adrenalectomy. The mechanism of regression after adrenalectomy seems to be the withdrawal of critical amounts of hormones. Urinary excretion of estrogen that continued after oophorectomy was abolished after adrenalectomy. Cortisone in the dosage of 100 mg. daily was capable of suppressing hypercalciuria and hypercalcemia in patients with extensive osseous metastases. Remarkable symptomatic improvement occurred, and high levels of serum calcium and urinary calcium excretion often returned to normal after cortisone therapy. There was, however, no evidence of actual cessation of bone destruction in these cases. There was no beneficial effect from the use of sex steroids and cortisone in patients who failed to respond to adrenalectomy or in those who relapsed after a remission. The authors conclude that simultaneous bilateral adrenalectomy in a one-stage operation is a practical therapeutic device for selected cases of advanced mammary cancer and that it will provide relief in a small percentage of patients.

Back Pain Due to Loose Facets of the Lower Lumbar Vertebrae. A. B. King. Bull. Johns Hopkins Hosp. 97:271-283 (Oct.) 1955 [Baltimore].

One of the causes of sudden severe low back pain is the unattached facet. This derangement of the back usually produces episodic attacks of excruciating discomfort, characterized by sudden onset and equally rapid relief of symptoms. The history and physical and operative findings of six patients with this back derangement are presented. The first patient stated that she could flex her back but it was painful to stand erect or to hyperextend her back. When performing these motions, she often felt a "clicking" sensation in the low back. Rest would relieve the back pain, but not completely. Only when she felt "something move" would she feel better. X-ray examination of the back, including anterior-posterior, lateral, and oblique views failed to demonstrate significant pathological changes. It was decided to explore the lower lumbar spine. The intervertebral disks of the L_3, L_4, and L_5 interspaces were normal. Each facet was then inspected and the inferior facet of L_4 was found separated from the lamina. It had rotated medially and become wedged between the lamina and ligamentum flavum. It was easily removed, being attached to the soft tissues of the back by remnants of the ligamentous capsule. Since the operation the patient has been free from the back pain. There was insufficient evidence in this and the other five cases or the literature to resolve the dilemma as to whether these loose facets are ununited fractures or congenital anomalies that have suddenly become symptomatic, or a combination of both. Developmental anomalies probably account for most of them, but trauma may play a part. Some occur after the lamina has been weakened by previous surgery. The diagnosis may prove difficult, because x-ray examination may fail to reveal the lesion and there is no characteristic symptom complex. It is highly suggestive if the patient feels "clicks" or "something moving" in his back and if symptoms come and go rapidly. To differentiate this from the other common back disorders such as herniated intervertebral disk, a free neural arch, or spinal cord tumor, it should be remembered that abruptness of onset and recession of excruciating back pain is unusual with any of these other conditions. None of the patients with loose facets objected to partially flexing the back, in contradistinction to patients with herniated disk or free arch, both of whom find this maneuver difficult and painful. Hyperextension and coming erect produced an exacerbation of symptoms caused by loose facets. The author makes a plea for a surgical exploration of patients with severe local low back complaints, despite "negative" x-ray studies. Excision of the loose facet is a simple and effective treatment.

Polyposis of the Large Intestine: Preservation of the Terminal Segment. W. G. Smith and R. J. Jackman. Am. J. Surg. 90:751-760 (Nov.) 1955 [New York].

Two schools of thought have evolved regarding the optimal therapy for multiple polyposis. One school, favoring the complete extirpation of all polyp-forming mucosa, prefers permanent ileostomy, colectomy, and proctectomy in every case of multiple polyposis. The other school advocates preservation of a terminal segment of large intestine, on the assumption that carcinoma can be prevented in this segment by the eradication of all polyps initially present and by the periodic removal of all new polyps as they appear. The authors are primarily concerned with the management of the preserved terminal segment of the intestine and particularly with the occurrence of carcinoma in it. They review observations on 86 patients so treated at the Mayo Clinic during the 21 year period terminating in 1954. This number included 59 with typical multiple polyposis, 10 with confluent or hyperplastic polyposis, 13 in whom the polyposis was mild in the terminal segment but multiple in the rest of the colon, and 4 in whom the polyposis was mild throughout the colon. Carcinoma has so far developed in 7 of the 86 patients, but it must be remembered that the series is heavily weighted by patients who have undergone operation in relatively recent years. Whatever the incidence may ultimately prove to be, the program of treatment discussed in this paper might be condemned if the alternative form of therapy were without hazard. The fact remains, however, that ileostomy retains many formidable aspects, and its long-term mortality may exceed that which will ultimately be noted in this series of patients. The authors conclude that preservation of the terminal segment of the intestine in multiple polyposis is attended by some risk in terms of development of carcinoma and of subsequent mortality from such carcinoma. This risk is believed justifiable in view of the risk attending the alternative form of treatment. Patients with a preserved terminal segment must be impressed with the gravity of the disease and with the importance of periodic proctoscopic examination. Periodic follow-up examinations should be no more than six to nine months apart and should continue for life. The length of the follow-up interval should be determined by the ever-present danger of cancer and by the severity of the recurrent polyposis. The terminal segment is easily and safely cleared of polyps by fulguration. Periodic examinations of the terminal segment are greatly facilitated by an end-to-end anastomosis.

Colotomy and Coloscopy in the Management of Mucosal Polyps and Cancer of the Colon. M. R. Deddish and R. E. Hertz. Am. J. Surg. **90**:846-849 (Nov.) 1955 [New York].

Colotomy and coloscopy for benign polyps constitutes a technique of multiple colotomies with endoscopic examination of the colonic mucosa. A patient should not be considered a candidate for this procedure until a suspected lesion has been demonstrated by more than one barium enema examination. The procedure is also used in conjunction with resection of the colon. Thorough preoperative cleansing of the colon is necessary. A left paramedian incision is usually adequate. The skin edges are protected from contamination by at least a double thickness of a laparotomy pad, and similar precautions are taken to protect the viscera. The colotomies are made through the longitudinal bands and carried out in the following sequence. If a lesion has been demonstrated within the left colon, the initial incision should be made directly over its base. The lesion is treated and endoscopic inspection of the remaining left colon is done. If no lesion has been detected in the left colon, the most accessible portion of the sigmoid is used. Inspection of the colonic mucosa should be completed through incisions in the midtransverse colon and through a slight enlargement of the cecal defect following appendectomy. A low-lying hepatic flexure may allow complete inspection of the right colon through the transverse colon incision. The colotomy incisions are closed by continuous No. 0000 chromic catgut to the mucosa and interrupted No. 0000 silk to the seromuscular layer. Demonstrated polyps or areas of hyperplasia are removed by suture ligature of the pedicle and excision, by cautery snare electrosurgical technique through the endoscope, or by segmental resection. The authors review observations on 148 patients who underwent colotomy and coloscopy at the Memorial Hospital in New York from 1948 to 1954. Lesions other than those detected radiographically were found in 46.6% of 103 patients with the preoperative diagnosis of polyps of the colon. Thirty-nine per cent of polyps found in addition to those demonstrated by radiography measured more than 1 cm. in diameter. Coloscopy or colotomy and coloscopy was carried out in 32 patients undergoing resection for cancer and additional lesions were found in 47%. Carcinoma was found in approximately one-quarter of all patients examined by colotomy and coloscopy, and atypia in polyps was found in a similar proportion. In seven patients new polyps developed within observed fields. Five of these were given diagnoses within three years. Forty-two per cent of polyps found were located in the sigmoid colon. Colotomy and coloscopy practiced with surgical treatment aids in the diagnosis of polyps and cancer, and affords a measure of cancer prophylaxis.

The By-Pass Operation in the Treatment of Arteriosclerotic Occlusive Disease of the Lower Extremities. E. S. Crawford and M. E. de Bakey. Surg. Gynec. & Obst. **101**:529-535 (Nov.) 1955 [Chicago].

The occlusive process in chronic arteriosclerotic arterial insufficiency of the lower extremities is often segmental in nature with a patent vessel above and below it. Owing to this feature of the disease, it is frequently possible to restore normal circulation in the peripheral arterial bed. This may be accomplished by thromboendarterectomy, excision of the occluded segment with replacement by a graft, or a bypass of the diseased area with a graft. Experience with these methods has disclosed a number of factors, both technical and physiological, that are essential to the success or failure of the operation. The procedure that has been found most effective in avoiding disadvantages and in meeting the requirements for successful results has been the bypassing operation. It consists in the addition of a large collateral vessel around the blocked area to those already present, but without disturbing them; that is, the concept of the bypass operation is based upon the natural response of the arterial tree to an occlusive process, namely, the enlargement of collateral vessels around the obstruction. The procedure is accomplished by the anastomosis of an arterial homograft end-to-side to the patient's artery above and below the occluded segment through two small separate incisions that are connected by a tunnel in the subcutaneous tissues. The advantage of this procedure lies in the fact that it not only permits restoration of a normal pulsatile blood flow into the peripheral arterial bed but also is associated with minimal jeopardy to the existing circulatory and functional capacity of the extremity. The minimal dissection required reduces the risk of injury and thrombosis to the main artery and to its collateral vessels in the region of occlusion as well as above and below this process. Because adjacent structures such as veins, lymphatics, and nerves are not disturbed, complications such as edema, neuralgia, and wound infections are largely prevented. These advantages are demonstrated by the gratifying results obtained. Blood flow through the main arterial channel distal to an occlusion was successfully reestablished in 37 of the 40 extremities in which this technique was employed. Success was determined by arteriography or by the presence of palpable pulses distal to the block which were absent prior to operation. The three failures were in patients whose borderline status was evidenced by small distal patent segments with secondary occlusions below. Particularly significant is the fact that none of these three was made worse by the operation. The clinical condition of the extremity and the postoperative arteriograms were unchanged. The indications for operation in the 37 successful cases were intermittent claudication in 29, gangrene of limited degree in 7, and in one, extensive gangrene.

Glomus Tumors: An Analysis of Twenty-Five Cases. C. Horton, C. Maguire, N. Georgiade and K. Pickrell. A. M. A. Arch. Surg. **71**:712-716 (Nov.) 1955 [Chicago].

The normal glomus is an end-organ apparatus that consists of an arteriovenous anastomosis functioning without an intermediary capillary bed. It consists of an afferent artery that is connected directly to a primary collecting vein by a tortuous anastomotic vessel termed the Sucquet-Hoyer canal. This canal is endothelium-lined and surrounded by smooth muscle fibers and glomal cells that are covered by a delicate collagenous material through which run numerous nonmyelinated nerve fibers. This glomic system is always found in the stratum reticulare of the skin. Glomic structures are distributed widely over the body but are somewhat more numerous on the extremities, particularly on the fingers and toes. The glomus is controlled by the autonomic nervous system, which may explain the pain, temperature changes, and sweating often associated with the glomus tumor. The authors present observations on 25 patients (16 women and 9 men) with glomus tumors. None of these patients had multiple glomus tumors, although multiplicity has been observed. The tumor is most frequently a deep red to purple or blue. It is rarely more than 2 to 5 mm. in size and may be so small as to be missed by inspection or palpation, and only the symptom of severe persistent pain in a minute area may lead to the diagnosis by excision and microscopic examination of the involved site. There is exquisite tenderness to touch. Even slight pressure may cause lancinating or radiating pain. The pain may recur with temperature changes. When the lesion is in the favorite subungual site, the nail is frequently thickened and ridged. Glomus tumors may erode bone. When destruction of the cortex of a terminal phalanx is detected on x-ray examination, the presence of a subungual glomus tumor should be suspected. The glomus tumor is benign, and complete removal of the lesion by surgery is curative. Occasionally pain will persist in the immediate area for a few months postoperatively but will usually resolve without further treatment. Radiation, the injection of sclerosing agents, and periarterial sympathectomy are of no value. The microscopic picture of a glomus tumor resembles a normal glomus except for a decided increase in glomal cells and nonmyelinated nerve fibers. Microscopic examination is advisable, because, if the diagnosis of hemangiopericytoma is established, a more extensive local excision is recommended, as invasion and metastases have been reported in such instances. Before adequate pathological studies had been made on glomus tumors, for which the term glomangioma has been suggested, they were referred to as painful cutaneous tubercles or as angioneuromyomas.

GYNECOLOGY & OBSTETRICS

Evaluation of One Year's Experiences with Culdocentesis at Charity Hospital of Louisiana at New Orleans. L. I. Post and G. Posner. J. Louisiana M. Soc. **107**:406-410 (Oct.) 1955 [New Orleans].

Of the 717 patients who had culdocentesis performed during the year from July, 1953, to July, 1954, 59 yielded nonclotting blood, in 30 patients pus was aspirated, peritoneal fluid was obtained in 527 patients, and 101 yielded no fluid. Of the 59 patients who had nonclotting blood on culdocentesis, 3 were not operated on. The diagnosis proved correct in 53 of the 56 patients operated on. Of the 30 in whom culdocentesis yielded pus, 4 had ruptured tubo-ovarian abscesses treated by immediate surgery; 15 had unruptured cul-de-sac or tubo-ovarian abscesses. The cul-de-sac abscesses were treated by colpotomy and the tubo-ovarian abscesses (which did not "point") were treated medically until they were "cooled down"; then they were treated surgically. Culdocentesis greatly aided in the selection of an antibiotic, since the pus obtained was smeared directly, then sent to the laboratory for culture and sensitivity studies. Three patients had pelvic peritonitis; six had acute salpingo-oophoritis; one had an old asymptomatic pyosalpinx; and one had a dermoid cyst of the ovary. All these patients were treated medically or surgically and there were no fatalities. Clear peritoneal fluid was revealed on culdocentesis in 527 patients, which was considered as normal. No fluid was obtainable on aspiration of the cul-de-sac in 101 patients and these were listed as dry. Culdocentesis is innocuous as shown by the absence of complications in the 717 patients in whom 1,088 "taps" were performed during the year. Physicians can perform culdocentesis at the office.

Vaginal Cytodiagnosis in a General Practitioner's Office. C. L. Fusfeld. GP **12**:109-118 (Oct.) 1955 [Kansas City, Mo.].

The author performed vaginal smears routinely on 2,699 women who came for pelvic examination. Two slides were made on each patient. Both the suction pipet method from the vaginal pool and the Ayre spatula scraping from the cervix were employed. The spatula method was preferred when the cervix was eroded. Commenting on the cost of this program the author estimates that at his office 1,000 vaginal smears were made at a total cost of about $245 and that for those who purchase prepared stains the cost for 1,000 vaginal smears would be about $500. Eleven cases of cancer of the cervix or endothelium were discovered with the aid of the vaginal smear. Five of the 11 patients had adenocarcinoma of the endometrium and 6 had squamous cell carcinoma of the cervix. The author feels that the diagnosis would not have been made except for the routine use of the vaginal smear. The pathological report in each of the six cases of carcinoma of the cervix was "carcinoma-in-situ." The five cases of endometrial cancer were diagnosed as stage 1. In reply to those who maintain that biopsy is the only method by which a diagnosis of cancer can be made, the author points out that biopsy would be done only on a cervix that shows a lesion and a diagnostic curettage only when symptoms of irregular bleeding are present, while the vaginal smear will trigger the process of discovery of an incipient cancer by the detection of suspicious cells in an otherwise symptomless patient. It is only by finding incipient cancer that the death rate will be reduced.

Treatment of Leukorrhea with Douches and "Broad Spectrum" Therapy. E. F. Pena. West. J. Surg. **63**:654-656 (Oct.) 1955 [Portland, Ore.].

Two hundred women with leukorrheal vaginitis largely caused by Trichomonas, and less frequently by Candida albicans, were subjected to the following regimen. After thorough self-douching at home with an aqueous solution of Amfrecin douche powder, containing a wetting agent, protein digestant, acid, carbohydrate, and soothing, cooling antipruritics, the patient was treated at the author's office with insufflation of one ounce of Baculin powder into the vagina through a speculum. Baculin is a proprietary preparation combining fungicides and trichomonacides with a wetting agent, a buffer, a protein digestant, and nutrient carbohydrates. Special care was taken to cover the entire surface of the vagina, cervix, and vulva by a vaginal "ballooning" to iron out the folds and rugae. This invariably brought immediate relief from burning and pruritus. The patient was then instructed to insert two Baculin tablets into the vagina at home each night and morning and close the orifice with a pledget of cotton. Self-administration was interspersed with two visits to the physician's office every week. The alternating office-and-home treatments were continued through at least one menstrual period. In some patients the regimen was followed through two and even three such periods with results that strongly favor such prolonged therapy. During menstruation the douching is sometimes advisable two or three times daily, followed by the usual insertion of tablets and vaginal stopper. It is strongly recommended that coitus be suspended during the entire course of treatment. Microscopic examination of the vaginal secretions revealed that the patient's response was immediate and rapidly progressive. Within a few days 170 (85%) women were completely free from Trichomonas and Candida infection. Another 26 (13%) patients required a slightly longer time. Four patients were therapeutic failures, which were attributed to a lack of cooperation either by the patient or her husband. Only 6 (3%) had a recurrence of the infection and all of these responded favorably to a second course of treatment. In view of these excellent results, the same therapy was used on patients with senile, nondiabetic vaginitis and was also used for prepartum and postpartum hygiene. It was likewise adopted as a preoperative and postoperative measure. In all cases the results were similarly gratifying.

The Use of Hormones in the Management of Pregnancy in Diabetics: Report to the Medical Research Council by D. D. Reid. Lancet **2**:833-836 (Oct. 22) 1955 [London, England].

The Medical Research Council of Great Britain appointed a committee to conduct a controlled clinical trial designed to assess the effect, if any, of treatment by the oral administration of stilbestrol and ethisterone upon the fetal survival rate in pregnant diabetic women. Nine centers were asked to cooperate in a centrally planned and controlled investigation. Comparable groups of pregnant women with diabetes but without cardiovascular complications attending the nine hospitals were stratified by age and parity and randomly divided into "hormone-treated" and "non-hormone-treated" groups. One group received tablets containing graduated doses of ethisterone and stilbestrol; the others were given inert but otherwise identical tablets. Hormone therapy commenced before the end of the 16th week of pregnancy, and up to the end of the 19th week the women received daily by mouth 50 mg. of stilbestrol and 25 mg. of ethisterone; to the end of the 23rd week, 100 mg. and 50 mg. of the two preparations, respectively; to the end of the 27th week, 100 mg. and 75 mg., respectively; to the end of the 31st week, 150 mg. and 125 mg., respectively; and from the 32nd week until delivery, 200 mg. of stilbestrol and 250 mg. of ethisterone. In all other respects the management of pregnancy was the same. All the patients, 76 hormone-treated and 71 non-hormone-treated, were followed for at least six months after delivery. The frequency of stillbirth and neonatal death in the two groups proved to be almost the same, with a total death rate of viable fetuses of 24% in the hormone-treated group and 26% in the other. Although birthweights were on the average equal, there were four congenital malformations in the treated group and seven among the controls; the frequency of malformation associated with fetal loss was, however, the same, being three in each group. Diabetic control during pregnancy was equally good in the two series, and the incidence of hydramnios, edema, and albuminuria was equal. There was no significant excess in the incidence of toxemia in the non-hormone-treated group, and the trends in blood pressure readings during pregnancy were identical. Assays designed to measure the urinary output of pregnanediol and chorionic gonadotropin were carried out. Although the methods of pregnanediol estimation are not specific, the assay results suggest that either one or the other, or both, of the oral preparations given were absorbed but that this had no effect on the pattern of hormone excretion associated with fetal loss. From these observations it is concluded that oral stilbestrol and ethisterone, in the doses here prescribed, do not reduce fetal mortality in diabetic patients and have little, if any, beneficial effect on maternal health in pregnancy.

PEDIATRICS

Anoxia in the Acute Respiratory Infections of Childhood: Its Recognition and Treatment. B. Morrison. Lancet **2**:737-740 (Oct. 8) 1955 [London, England].

As the result of the control of bacterial infections by antibiotics, the clinical picture of acute respiratory infections in infants and children has undergone a considerable change. The toxic form of illness with hyperpyrexia and repeated convulsions that in the past often had a fatal outcome is now comparatively rare; however, anoxia has become more prominent and is now the main cause of death, largely because bronchiolitis, which is becoming increasingly common in infants under the age of one year, does not respond to antibiotic therapy and often produces a suffocative picture. The author studied the problem of anoxia as part of an investigation of severe respiratory infections in 108 infants and children. This report presents the results of correlating oxygen saturation estimations, clinical data, and response to oxygen therapy. It was found that direct estimations of arterial oxygen saturation are difficult and time-consuming, and as a method of assessing the need for and controlling oxygen therapy they are impracticable in routine hospital work. In this study, the author demonstrates the close relation between restlessness and anoxia and also the fallibility of relying on the child's color, at least in the lesser degrees of anoxia. The behavior of the infant emerged as the most reliable clinical guide in the control of oxygen therapy. Before making a diagnosis of anoxia it is necessary to exclude restlessness due to hunger, discomfort, loneliness, or pain. In the presence of obvious respiratory distress, restlessness is usually due to anoxia. In some of the children, the standard oxygen tent, giving an oxygen concentration of from 40 to 45%, was inadequate for the relief of anoxia, and higher concentrations were required. These were supplied by a small tent, face-mask, or special oxygen box designed to give up to 90% oxygen. With the use of these higher concentrations when necessary, the oxygen lack was relieved in 31 out of 32 children.

Coarctation of the Aorta with Patent Ductus Arteriosus. W. B. Seaman and D. Goldring. J. Pediat. **47**:588-598 (Nov.) 1955 [St. Louis].

The authors report on 12 infants with coarctation of the aorta associated with patent ductus arteriosus who had roentgenographic examinations and in whom the diagnosis was confirmed by surgical exploration or autopsy. In five patients an angiocardiogram was done. Four illustrative cases are described in a 7-month-old baby girl and in three baby boys aged 8 days, 6 weeks, and 3 months, respectively. In the girl the coarctation of the aorta was distal to the aortic mouth of the ductus arteriosus, while in the boys it was proximal to it. Coarctation of the aorta associated with a patent ductus arteriosus is not a rare congenital anomaly and frequently results in cardiac failure and death. In the baby girl chest roentgenograms revealed moderate cardiac enlargement with elevation and rounding of the apex suggesting right ventricular enlargement. Pulmonary vascular engorgement was present, suggesting hypertension in the lesser circulation. In the three baby boys, conventional roentgenograms of the chest also revealed moderate to pronounced right ventricular cardiac enlargement and dilatation and engorgement of the pulmonary vessels. Although the diagnosis may be difficult, a correct clinical diagnosis can be made by the use of flush blood pressure technique, blood oxygen studies, and conventional roentgenograms. Angiocardiography is the most accurate method of differential diagnosis, but it is not without hazards in infants who are in critical condition. Two immediate deaths occurred in the five patients subjected to this procedure, both in cyanotic infants with a coarctation proximal to a patent ductus arteriosus allowing a right-to-left shunt. If the coarctation is distal to the patent ductus arteriosus, the hazard of angiocardiography may be less, but this diagnostic method should be used only if the clinical diagnosis is not firmly established. The difficulties in diagnosis are minor compared with the difficulties observed in the therapeutic approach. The prognosis for most infants with coarctation of the aorta associated with patent ductus arteriosus is poor. Medical management was ineffective and all patients so treated died. Five died during an attempt at surgical correction. The authors still feel that there is more hope in surgical intervention and, in several patients reported on by other workers, resection of the coarctated segment and division of the patent ductus arteriosus was successfully performed and was followed by marked clinical improvement.

The Treatment of Tuberculosis of the Superficial Cervical Lymph Nodes in Children. E. L. Kendig Jr. and T. M. Wiley Jr. J. Pediat. **47**:607-613 (Nov.) 1955 [St. Louis].

Since 1947, 12 boys and 13 girls between the ages of 17 months and 10 years with tuberculosis of the superficial cervical lymph nodes were treated at the Medical College of Virginia Hospitals. Excision of the involved nodes was carried out in all 25 patients, 14 of whom were given isoniazid alone or combined with other drugs; streptomycin or dihydrostreptomycin was given alone or in combination with other drugs to 16 patients; antimicrobial therapy was not combined with surgical excision in 4 patients. Tonsillectomy was performed in 13 patients, but there was little evidence that the tonsils were the portal of entry of the tuberculous infection. Results obtained with these various types of treatment suggest that progressive tuberculosis of the superficial cervical lymph nodes in children should be treated as follows. Complete excision of the node or nodes and the additional use of isoniazid and aminosalicylic acid (PAS) for at least one month preoperatively and for a two to three month period after surgical intervention would appear to be the ideal approach to the treatment. In this manner, an accessible focus of tuberculosis can be readily eradicated and any active tuberculous process may have a reasonable course of antimicrobial therapy. While it may be true that the primary tuberculous focus is not present in the tonsils or adenoids in this condition, it is also true that an attack of tonsillitis may cause activity of the tuberculous process in the regional lymph node. Whenever there is the slightest question of tonsillar disease, therefore, tonsillectomy and adenoidectomy are indicated. If purulent drainage from the nodes is already present or if the area of liquefaction is so large that satisfactory excision of the area cannot be effected, incision and drainage, with local use of streptokinase and streptodornase according to Hazlehurst's technique appears to be indicated. Even in this instance, however, later excision of the area would seem wise. In addition, isoniazid and aminosalicylic acid therapy for several months during and after the healing process appears to be indicated.

Progressive Vaccinia Associated with Agammaglobulinemia and Defects in Immune Mechanism. P. J. Kozinn, M. M. Sigel and R. Gorrie. Pediatrics **16**:600-608 (Nov.) 1955 [Springfield, Ill.].

In 1947 there were 45 cases of generalized vaccinia among five million persons vaccinated against smallpox in New York City, an incidence of 1:110,000 vaccinations. No age group was exempt. Thirty-eight persons, that is, 84% of those affected, had eczema preceding the generalized vaccinia. In rare instances following vaccination, diffuse cutaneous lesions continue to appear for a period of several weeks and show no evidence of healing. The later vaccinal crops do not undergo an accelerated reaction—a process that would occur if immune bodies were formed by the patient. The original vaccination continues to enlarge until it reaches an unusual size. Such a reaction, with fatal outcome, occurred in a 3-month-old male infant. Virological and histological studies indicated that the lesions were caused by vaccinia virus. The disease was associated not only with defects in the immune mechanism but also with agammaglobulinemia. Despite electrophoretic determination of the latter condition, the serum yielded positive results in the hemagglutination inhibition and neutralization tests, though not in the complement fixation test. Some of the reactive substances in the serum, especially the neutralizing substances, were probably antibodies passively acquired. Pathologically, the disease was characterized by lymphopenia, absence of healing, and lack of inflammatory response. The infant was treated unsuccessfully with gamma globulin and plasma from recently vaccinated donors, corticotropin and cortisone, and various antibiotics. Successful treatment of this condition with antivaccinal gamma globulin has recently been reported.

Vaccinia Gangrenosa Treated with Hyperimmune Vaccinal Gamma Globulin. G. J. Barbero, A. Gray, T. F. McNair Scott and C. H. Kempe. Pediatrics *16:609-618* (Nov.) 1955 [Springfield, Ill.].

The case of a 5-year-old boy with progressive necrosis of the site of a primary vaccination on the left deltoid area is described. The term "vaccinia gangrenosa" is suggested to distinguish such cases from other types of generalized vaccinia. By the time the boy was first seen in hospital, four months after the vaccination, there were metastatic lesions to other areas of skin on the arm, chest, and scalp, and to the shaft of the fourth metacarpal bone of the right hand, where an osteomyelitis developed. Vaccinia virus was isolated from the necrotic lesion of the skin of the arm and from the bone lesion. No circulating antibodies to vaccinia virus could be found in the blood stream. The lesion showed healing immediately on treatment with hyperimmune vaccinal gamma globulin obtained from recently vaccinated adults. After a total of five doses given over a six week period, vaccinia virus was no longer detectable in the skin lesion. All primary and metastatic lesions were completely healed by four and a half months after the first treatment. The boy appears to be the first patient to survive this complication of routine smallpox vaccination. His case is also noteworthy in that the osteomyelitis that developed was shown to be due to vaccinia virus.

DERMATOLOGY

Local Cold Injury: A Report of Sequelae. J. C. Shafer and A. W. Thompson. A. M. A. Arch. Dermat. **72**:335-347 (Oct.) 1955 [Chicago].

The authors summarize observations on 54 men with residuals following cold injuries. A history compatible with injury due to trench foot or frostbite, or substantiation of these diagnoses by hospital records, was obtained in all patients. Some had a history of trench foot incurred during 1944-1945 in Europe, or of the ground type of frostbite incurred in Korea or in winter military maneuvers elsewhere. In only six patients was tissue loss sufficient to require surgical procedures, such as skin grafting or minor bone amputations. The patients requested treatment for sequels of their cold injury from six months to nine years after cold injury. Pain in the involved sites was a prominent symptom in 48 patients; it took the form of aching, burning, sharp pain, and, rarely, shooting pain and cramping. Occasionally, several types of pain were present. Pain was aggravated by prolonged standing and walking, exposure to cold, and certain types of footgear. Two patients with previous amputations had causalgia syndromes in the stump areas after cold injury. Hyperhidrosis was reported by 44 patients; among two-thirds of these it was regarded as one of the major causes of disability. Bromhidrosis was noted by three. Other complaints were drenching sweat requiring frequent changes of footwear; increased reactivity to cold; paresthesias, predominantly numbness and tingling or a pins-and-needles sensation; dermatitis; and color changes, either cyanosis or rubor, of the feet. Intermittent swelling of the feet and ankles was described by 19 patients. Treatment was given to 33 patients, the remaining 21 having been admitted only for evaluation prior to retirement from the military services, cold injury residuals being either the primary or contributing cause of disability. Local measures for treatment of hyperhidrosis proved of little value. Orthopedic treatment was prescribed in 12 patients. Metatarsal bars, Thomas heels, convalescent shoes, or shoe padding were of value in alleviating symptoms. Physical therapy, whirlpool baths, and various types of active and passive exercise were of value. Psychiatric management was required by some individuals. Sympathectomy was carried out in eight patients. During the periods of follow-up, sympathectomy controlled hyperhidrosis in these eight patients; of six with dermatitis, three failed to improve. In four patients in whom pain was a prominent symptom, little change was noted. On the whole, management of these patients is inadequate, although symptomatic relief of varying degree can be obtained in some. It is suggested that a more critical evaluation of the neurological involvement would be of importance in further investigations of late cold-injury syndromes.

The Treatment of Hemangioma Chiefly by Irradiation. G. E. Pfahler. A. M. A. Arch. Dermat. **72**:425-437 (Nov.) 1955 [Chicago].

The author reports on a follow-up of 836 cases of hemangioma in private patients treated by him during the past 35 years. If the proper method is applied, practically all these lesions can be cured except the "naevus flammeus" and some of the visceral lesions. He discusses the treatment of the following lesions: cavernous hemangioma, which he divides into two groups (1) the strawberry type, which is superficial, and (2) the large cavernous type; tumorous cavernous hemangioma; the hemangioma of the vertebra; hemangioma of joints; and hemangioma of the larynx. On the basis of his own experiences in the treatment of these lesions confirmed by study of the literature, he feels that all of these lesions should be treated as early in life as is practical, preferably within the first few months. The great majority are best treated by irradiation. For most of the lesions, the gamma radiation from radium will give the most satisfactory cosmetic results, but at times this radium treatment should be supplemented by high-voltage x-rays, and, at times, the high-voltage x-ray treatment is preferable to any other. Sometimes treatment of these lesions is best supplemented by either electrosurgery or scalpel surgery. Each case presents an individual problem, and the treatment or combination of treatments should be adapted to the conditions present. It is best to treat the larger lesions by irradiation before caustics have been used or ulceration has taken place. In that way scarring can nearly always be avoided.

OPHTHALMOLOGY

Myopia of Prematurity. M. C. Fletcher and S. Brandon. Am. J. Ophth. 40:474-481 (Oct.) 1955 [Chicago].

The development of the eyes in 462 premature infants, 136 of whom had retrolental fibroplasia, was studied over the past four years. These infants were found to have a high and fluctuating myopia during the neonatal period, more exaggerated in the small infants with immature eyes and in those infants in whom retrolental fibroplasia developed subsequently. Myopia observed early in retrolental fibroplasia may remain as a residual of the disease. The mechanism of the production of myopia in premature infants appears to be associated with the immature eye and the underlying metabolic disturbance in retrolental fibroplasia. There probably exists an abnormality in the metabolism of the media of the developing eye, which produces changes in the axial length, corneal curvature, and index of refraction. Any or all of these combined could produce an increased myopia. The abnormal extrauterine existence of the prematurely born infant may be a causal factor in such abnormalities in the metabolism of the media of the developing eye.

Sulfonamides as a Cause of Toxic Amblyopia. R. G. Taub and R. W. Hollenhorst. Am. J. Ophth. 40:486-490 (Oct.) 1955 [Chicago].

In the 10-year period from 1944 to 1953, inclusive, four patients at the Mayo Clinic had visual loss from toxic amblyopia related to sulfonamide therapy. The total amount of the sulfonamide preparations given to the first three patients was not great, being 5.0, 7.0, and 3.5 gm., respectively; the fourth patient received 110.5 gm. The first patient was given a combination of sulfamerazine, sulfamethazine, and sulfadiazine; the second received an unknown sulfonamide; the third was treated with sulfathiazole; and the fourth received Sulfasuxidine and sulfadiazine. Sulfonamides were not detectable in the blood of two of the patients after visual loss had occurred; the test was not done on the other two. Loss of vision occurred in the first patient on the 6th day of administration, in the second patient 3 days after completion of 2 days of therapy, and in the fourth 2 days after completion of 18 days of treatment. The vision of the first patient returned to normal in about four months, that of the second could not be followed, that of the third returned to 6/6 in one month, and that of the fourth improved to 6/12 in the right eye and to 6/10 in the left eye 12 days after the onset of the ocular disturbances. It is questionable whether or not the fourth patient actually had bilateral toxic neuritis. Certain aspects suggested the possibility of some type of bilateral lesion of the occipital lobe, either thrombotic, embolic, or metastatic, rather than toxic optic neuritis. The authors reach the conclusion that toxic neuritis involving the optic nerves can result from the systemic use of the sulfonamides. The loss of vision is probably caused by idiosyncrasy or allergy to the drug rather than overdosage. Treatment other than discontinuance of administration of the sulfonamide apparently is not necessary, as the three patients who could be followed up recovered spontaneously. With one exception, patients reported on in the literature likewise recovered their vision.

Malignant Edematous Exophthalmos. M. Albeaux-Fernet and J. D. Romani. Semaine hôp. Paris 31:3144-3153 (Oct. 14) 1955 (In French) [Paris, France].

Malignant exophthalmos is characterized by true protrusion of the eyeball (in contrast to false exophthalmos due to widening of the palpebral fissure). The protrusion is monstrous and usually bilateral. Edema and inflammation are present; the conjunctivas are injected. There is paralysis of convergence and of lateral movement. The patient complains of photophobia and severe tension in the orbits and frontal region, perhaps even in the entire cranium. In addition to these phenomena, there is almost always pretibial edema, sometimes accompanied by the severe skin lesions known as "circumscribed pretibial myxedema," which can be treated by injections of corticotropin. The exophthalmos is progressive and occasions complications, not through its severity, but through the rapidity of its development. Papilledema may be accentuated, causing hemorrhages and exudates. The two worst local complications are corneal ulceration and optic neuritis. The last stages of the disease are characterized by fever, intense headache, vomiting, diarrhea, loss of weight, and torpor leading to a comatose state interrupted by periods of agitation or carphology, severe elevation of temperature, and death. Sixty-five per cent of cases of malignant edematous exophthalmos occur in men. The most frequent circumstance of appearance is regressing hyperthyroidism, especially when the disease has been treated by thyroidectomy. The condition may also be seen in developing hyperthyroid disease or in old disease when a state of thyroid exhaustion has established itself. Myxedema, especially that of the menopause, is also a cause. Pathologically, the lesions consist of edema in the different elements, cellular infiltration, degeneration of the connective tissue leading to fibrosis, and degenerative myositis with atrophy of fibers, disappearance of striation, surcharge of fat droplets, and perivascular round-cell infiltration. The lesions are comparable to those produced experimentally by injection of thyrotropin. It is true that this hormone of the anterior pituitary causes edematous exophthalmos through its elective action on the retro-orbital tissue, but there is also a systemic process in the disease, which is manifested by mobilization of fats (atrophy of the usual fat deposits, elevation of plasma fats, and abnormal deposition in the liver, muscles, and kidneys). The authors discuss the complicated pathological mechanisms involved, pointing out that recent work by Dobyns and coworkers has isolated an exophthalmos-producing substance (EPS) distinct from the thyroid-stimulating hormone. Treatment of malignant edematous exophthalmos is often surgical decompression of the orbit. Other measures are aimed at destroying or inhibiting the hypophysis or its anterior lobe and still others, at inactivating thyrotropin.

Results of Surgical Hypophysectomy in a Case of Malignant Edematous Exophthalmos. M. Albeaux-Fernet, J. Guiot, S. Braun and J. D. Romani. J. Clin. Endocrinol. 15:1239-1246 (Oct.) 1955 [Springfield, Ill.].

The authors present the history of a 56-year-old woman who had severe protrusion of the eyeballs, even though they were buried in palpebral edema. The patient was considered to have hyperthyroidism, in spite of the absence of marked enlargement and vascularity of the thyroid. Her extended fingers showed a slight tremor, the electrocardiogram showed sinus tachycardia, and the basal metabolic rate was high. The ocular signs were thought to indicate the presence of hyperpituitarism as well as hyperthyroidism, and for this reason a rapid cure of the hyperthyroidism was considered inadvisable. Complete rest with sedation and treatment with vitamin A and an antithyroid drug were prescribed, and under this treatment the woman became more calm and palpitation and precordial discomfort subsided. The exophthalmos at first remained unchanged, but later it progressed and blepharoconjunctivitis with tearing and injection of sclera developed. The globes became harder, and the ocular tension increased. An attempt was made to inhibit the overactive pituitary with x-ray therapy, but the exophthalmos increased. Treatment with thymus extract was tried, on the basis of evidence that thymus extract neutralizes the thyroid-stimulating hormone. Although this treatment was followed by a slight, temporary reduction in the exophthalmos and in the basal metabolic rate, later the exophthalmos progressed again, despite the continuation of treatment. In order to counteract the malignant exophthalmos, a hypophysectomy was now performed, and this resulted in a marked amelioration. Histological examination of the pituitary tissue showed an increase in the numbers and in the secretory activity of cells that are considered to be the site of production of the thyroid-stimulating hormone.

OTOLARYNGOLOGY

Ossifying Fibroma of the Paranasal Sinuses. E. M. Skolnik and E. J. Fornatto. Ann. Otol. Rhin. & Laryng. 64:689-700 (Sept.) 1955 [St. Louis].

Ossifying fibroma, a variant of the intraosseous form of fibroma, has been referred to as "sarcoma," "sarcoma psammosum," "sarcoma osteogeneticum," or "psammoma." The absence of nuclear monstrosities, mitotic figures, and protoplasmic anomalies has induced most recent authors to consider these growths as benign tumors and designate them as fibromas. On clinicopathological grounds, ossifying fibroma has been regarded as a variant of the monostotic fibrous dysplasia of Lichtenstein. Four cases of ossifying fibromas involving the paranasal sinuses are reported. The first patient had an ossifying fibroma of the maxillary sinus; the second had an ossifying fibroma of the maxilla involving the antrum; the third a cystically degenerated ossifying fibroma of the antrum; the fourth a cystic ossifying fibroma of the supraorbital region involving the walls of the frontal sinuses. Ossifying fibromas of the paranasal sinuses have a rather insidious development. They are generally unsuspected until expansion of the bony walls of the sinuses calls attention to their presence. However, cases of persistent or frequently recurrent "sinusitis," which fail to respond to the usual treatment, must receive a thorough evaluation and radiological study. The first sign of disease is generally a local swelling associated with local tenderness; displacement of the eye and functional disturbances may be present. Ossifying fibromas are solitary lesions that do not metastasize and when completely removed do not recur.

However, by virtue of extensive growth and pressure on surrounding vital structures, they can be clinically malignant, though histologically benign. Radiologically, ossifying fibromas are evident early as small, round swellings involving a cranial or facial bone and eventually projecting into the sinuses. However, because of the nonspecific character of the roentgenologic aspects, many different lesions must be considered in the differential diagnosis. Massive fibromas may be present as benign expanding tumors with pressure atrophy of a part or whole of the sinus walls. In some cases pressure atrophy can cause lesions resembling destruction, and the differentiation from a malignancy may be impossible on radiological grounds alone. In these cases biopsy must be resorted to. In treatment, roentgen therapy has proved of limited value, and, in view of the benign character of the ossifying fibroma, massive resection and sacrifice of facial bones, with their accompanying disfigurement and high mortality, are not justified, but the growth should be removed as thoroughly as possible. If the lesion recurs, further resection is indicated. On histological examination, the uniformity of the nuclei and lack of mitosis demonstrate the benign nature of the ossifying fibroma. The variability in the amount of fibrous and osseous tissue, the different character of the fibrous stroma and fibrous cells, the presence of osteoid tissue and of islands or trabeculae of bone, the degree of layering of osteoblasts and osteoclasts around bone, or the presence of giant cells scattered throughout the stroma not only are expressions of the continuous transformations these tumors undergo during their growth but probably reflect an advancing histological maturity parallel with increasing age of the patient.

The Cervical Spine and the Globus Syndrome. L. F. Morrison. Ann. Otol. Rhin. & Laryng. 64:753-765 (Sept.) 1955 [St. Louis].

The complaint of "a lump in the throat" is a common one. The otolaryngologist confronted with this problem remembers that in the differential diagnosis he must consider postcricoid carcinoma, carcinoma of the pyriform fossa, stricture, Plummer-Vinson syndrome, enlarged styloid process, pharyngeal pouch, pharyngeal paralysis, and other conditions. After these have been ruled out the complaint is often regarded as of a "neurotic" origin and the diagnosis of "globus hystericus" is made. The author shows that pathological changes in the cervical spine are one of the tangible causes of the globus syndrome. The complex neuroanatomy of the cervical spine area readily explains peripheral nerve manifestations in regions from the diaphragm to the top of the head. A tentative diagnosis of osteoarthritis of the cervical spine may be made from the clinical history of patients with the globus syndrome. Roentgenograms will confirm or negate the tentative diagnosis. The relief of symptoms following simple therapeutic measures will substantiate the diagnosis. Cervical arthritis should be ruled out as a tangible cause for the complaint of "a lump in the throat" before the patient is advised to forget about the discomfort or is sent for psychiatric evaluation and treatment.

PATHOLOGY

Diverging Sex Morbidity Trends in Cancer of the Mouth: A Hospital Morbidity Study. M. H. Russel. Brit. M. J. 2:823-827 (Oct. 1) 1955 [London, England].

In northwestern England, that is, in the region of Manchester, which has a population of approximately 4,500,000 (47% men, 53% women), morbidity rates for cancer of the mouth in each sex were calculated for the periods from 1935 to 1939 and from 1945 to 1949. The figures for men in the two periods were 1,077 and 777, respectively, and for women 119 and 209, respectively. Thus the trends over a decade show a marked decrease in the incidence of cancer of the mouth in men, and an increase in the disease in women. Although the incidence of the disease has decreased in men, they have previously been shown to exhibit a worse response to treatment and to be more prone than women to develop metastases; in women there is greater vulnerability so far as incidence is concerned, but a higher rate of recovery and of resistance to dissemination of the disease. The age-specific trends for males, which yield a lowered incidence of varying degrees throughout the entire range from 45 years upward, suggest the removal or diminution of etiological factors. Two factors could conceivably be partly responsible, namely, improvements in the control of syphilis and in the incidence of oral leukoplakia. It is conventional to regard the incubation period for cancer as 20 years. Reference has previously been made by other investigators to the hypothesis that, in men, local aggravation is a relevant factor in susceptibility to the disease but that, in women, a systemic factor, such as microcytic anemia, is responsible. The region studied was predominantly a textile area until about 1935 when, as a result of severe and prolonged trade recession, other industries were gradually developed. Social conditions from about the middle of the 1920's cannot be ignored and may have some significance.

Optical Density of Serum in Cancer: Comparison with Findings in Patients Having Other Diseases and in Normal Persons. J. A. Quinn, S. A. Katz and A. E. Rappoport. Am. J. Clin. Path. 25:1128-1147 (Oct.) 1955 [Baltimore].

While investigating an immunologic reaction for the diagnosis of cancer, the authors found the end-points to be indefinite, and so they attempted to measure the reaction objectively, by means of the optical density scale of the Coleman Jr. spectrophotometer. The results were varied and unrelated, but it was noted that there were distinct differences between the optical densities of serum from normal persons and from patients with cancer. Accordingly, a systematic investigation was undertaken to determine whether this difference was apparent or real and whether it could be used as a cancer screening test. Studies were made (1) on seemingly well persons: blood donors, applicants for premarital serologic examination, persons undergoing routine physical examination, and persons hospitalized for correction of structural defects; (2) on pregnant women and on patients having diseases other than cancer; and (3) on patients with cancer. Serums from 1,736 persons were examined. A specimen of 5 ml. of venous blood is obtained in the fasting state or four hours after the last meal. The optical density of the serums must be tested within six hours after venipuncture. Optical density is determined at room temperature (22 to 25 C), using a Coleman Jr. spectrophotometer with an adapter for 12 by 75 mm. cuvets. After initial testing at room temperature, the specimens are refrigerated for one hour at 2 to 10 C in the original cuvets. After refrigeration, the specimens are allowed to stand at room temperature for five minutes. The testing procedure is then repeated to obtain a second measurement. The reading of the room temperature is subtracted from the refrigerated reading and a numerical difference is obtained. The authors found that there are specific differences in the optical density of serum between normal and diseased persons. Negative reactions were obtained in 466 (97.7%) of 479 normal persons and in 817 (86.3%) of 944 noncancerous patients. False-positive results were encountered chiefly in persons with acute and chronic inflammations and in pregnancy. There was a strong correlation between the result of the test for optical density and the occurrence of malignant neoplasms. In 313 patients with histologically proved cancer, the test gave a true positive result in 282 (90.1%). False-negative results were encountered predominantly in patients with anaplastic, generalized metastatic, or terminal cancer. The serum factor responsible for these differences seems to diminish in optical density in inverse proportion to the growth and spread of cancer.

Cytologic Studies on Pleural and Peritoneal Fluids. J. H. Childers. Texas J. Med. 51:674-678 (Oct.) 1955 [Austin, Texas].

Fluids removed from the pleural or peritoneal cavities were observed with regard to color, opacity, specific gravity, volume, and presence of fragments of tissue or coagulability. For cytological examination, sufficient stock formaldehyde (40%) was added to make a 10% solution. After these solutions were mixed, an interval of 4 to 20 hours was allowed for fixation. A cell block was secured by centrifuging the specimen to concentrate the sediment. These cell blocks, which varied from 2 to 10 mm. in diameter, were then wrapped in filter paper and processed with the routine surgical tissues. Paraffin blocks were sectioned at 5 μ thickness, stained with hematoxylin and eosin, and mounted. Special stains were used when indicated. Each specimen was reported as not having malignant cells, having atypical cells, or having malignant cells. In the event that irregularly shaped cells with degenerative changes or suggestive arrangement of cells were encountered but a definite diagnosis of malignant cells was not justified, the specimen was reported as having "atypical cells," and study of additional fluid specimens was recommended, neoplastic cells often being discovered in later specimens. Studies were made on 528 fluids from 345 patients. Of 333 pleural fluids, 76 fluids from 55 patients contained atypical or malignant cells. Histological confirmation of a malignant neoplasm was secured by surgical excision of tissue for biopsy from 10 cases and autopsy studies of 6 cases. Twelve additional patients with atypical or malignant cells in the pleural fluid died at home, and no postmortem examination was performed. A false diagnosis of malignant cells was made in two pleural fluids from two patients, both of whom had arteriosclerotic heart disease with congestive failure. In 8 of the 55 patients, malignant cells were demonstrated in the pleural fluid of patients not previously having a clinical diagnosis of malignant neoplasm. Of 195 peritoneal fluids from 141 patients, 61 specimens from 43 patients contained atypical or malignant cells. In this group histological confirmation of a malignant growth was secured from surgically excised tissue in 6 cases and by autopsy studies of 10 additional cases. Seven additional patients in this group died at home, and no postmortem examination was secured. No false-positive diagnoses were made on the basis of the studies on the peritoneal fluids.

RADIOLOGY

Unspecific Bronchostenoses and Bronchiectases Mainly from Roentgenologic Viewpoint. T. Denstad. Tidsskr. norske lægefor. 75:637-639 (Sept. 15) 1955 (In Norwegian) [Oslo, Norway].

Bronchostenoses may originate through pressure from the outside, often from enlarged lymph nodes, a form most frequently seen in childhood. A large aortic aneurysm may also compress the bronchi. There may be localized thickening of the bronchial wall with resulting stenosis, presumably after an acute bronchitis, where perhaps traumatization of some kind causes a local reaction with inflammation of the mucous membrane. A chronic stage sometimes results, with formation of granulation tissue, causing hemoptyses, atelectases, and bronchiectases. The process, while reversible, may lead to scar formation with permanent changes. If the stenosis is situated in a large bronchus, it can often be established by a good ordinary roentgenogram. Bronchiectases are after tuberculosis the most common of the chronic pulmonary affections. Clinical diagnosis may be difficult. Congenital bronchiectases are rare and are due to congenital weakness of the bronchial wall. Acquired bronchiectases are more frequent than generally supposed, especially in the milder degrees, and should be borne in mind in chronic bronchitis, asthma, and emphysema, also in pneumonia with delayed resolution, bronchopneumonia with bleeding, and in chronic sinusitis. Bronchiectases most often originate in childhood. The most important causes are bronchostenosis with atelectasis and infection. Roentgen examination and planigraphy often give good results for diagnosis, but for a satisfactory survey of the conditions bronchography is required. It is important to determine whether the bronchi in the other lobes are normal, particularly if surgical treatment is considered. Slight bronchiectases can be revealed only by bronchography. Bronchiectases are especially to be suspected in asthma with purulent expectoration, hemoptysis, and recurring infections. The examinations should be carried out only when the patient is in a good condition. The roentgenologist's task is to establish the diagnosis of bronchiectasis so early that the patient's age and general condition and the accompanying pulmonary complications do not contraindicate lobectomy where this is otherwise possible. The prognosis is unfavorable without surgical treatment. Bronchography is called for on the slightest suspicion of bronchiectasis, provided there are no contraindications. This holds also for bronchostenosis, if bronchoscopy with biopsy does not give satisfactory information. It is urgent first and foremost to exclude or establish the presence of bronchial cancer.

Roentgen Therapy of Subdeltoid Tendinitis and Bursitis. M. Shoss and T. G. Otto. Missouri Med. 52:855-863 (Nov.) 1955 [St. Louis].

Bursitis of the shoulder may be either acute or chronic. The pain in acute cases is severe and incapacitating; in chronic cases, it is more tolerable but may be troublesome for months. Restriction of movement, which is most pronounced in abduction and rotation, may lead to a frozen shoulder. Patients with acute bursitis are severely ill and should be given treatment to relieve their pain and disability as soon as possible. Many forms of therapy have been tried with varying success. Novocaine infiltration and needling of calcific deposits are often effective; hydrocortisone injections are being used with good results in an increasing number of cases; and surgical excision of calcifications is sometimes the treatment of choice in long-standing disease. The greatest interest, however, has centered on x-ray therapy, which not only produces excellent results but is easy, rapid, and economical inasmuch as it can usually be given as an outpatient service. Comparable results have been obtained in various series regardless of the technical factors used. Intermediate range therapy, however, has often been advocated and was employed by the authors in 159 patients. The technical factors were essentially the same in all cases, with 140 kv., 15 ma., 50 CM-TSD, ¼ mm. copper and 1 mm. of aluminum (HVL 0.5 mm. copper). Most of the patients received daily treatments of 150 r in air through alternate anterior and posterior 15 by 15 mm. ports to the shoulder on alternate days for a total of six days. Three patients had bursitis first in one shoulder and then, 6 to 17 months later, in the other. Six other patients had recurrences in the same shoulder from 10 to 46 months later. Most cases will respond to x-ray therapy completely in from three to four weeks, but in some the improvement will take place slowly over a period of about three months. Recovery, as might be expected from the nature of the underlying process, which is one of degenerative change, is usually slower in chronic cases. Follow-up of the authors' patients showed satisfactory results, i. e., no pain or only occasional pain, in 84 (95.4%) of the 88 cases of acute bursitis and in 56 (86.1%) of those that were chronic.

Rounded Intrathoracic Lesions. D. W. Springer, P. E. Geiger and H. T. Langston. Am. J. Roentgenol. 74:827-849 (Nov.) 1955 [Springfield, Ill.].

The authors describe 20 cases of varied, rounded intrathoracic lesions in men between the ages of 24 and 63 years. These patients were seen in the course of 10 months on an active thoracic surgical service. The nature of these lesions could not definitely be ascertained by a very comprehensive work-up, including bronchoscopic examination, before the surgical removal and pathological study of the lesion. The pathological diagnosis was that of encapsulated empyema, benign fibrous mesothelioma, thymic cyst, anterior mediastinal teratoma, pericardial cyst, respectively, in five patients, primary undertermined adenocarcinoma in two, metastatic carcinoma in two, metastatic sarcoma in one, primary carcinoma in six, primary sarcoma in two, and probably tuberculous granuloma in three patients. The incidence of malignancy was high. The following conclusions were reemphasized by this group of patients. A correct appraisal of the nature of the circumscribed rounded intrathoracic lesions is usually not possible without subjecting them to direct examination at thoracotomy with removal of tissue for microscopic examination. Dissimilar pathological processes in the chest may produce virtually identical roentgenologic shadows; the same disease entity, on the other hand, may produce quite dissimilar roentgenograms. The presence in the lung of a lesion presumed to be metastatic from a primary neoplasm elsewhere may not always indicate widespread dissemination, and an aggressive attitude toward the lesion should probably be taken, especially if there has been a relatively long tumor-free interval. It might possibly be a solitary metastatic lesion with no other tumor foci remaining. A solitary pulmonary lesion in a person with previous adequately treated malignant disease elsewhere could represent a second primary neoplasm instead of a metastatic deposit. This further justifies an aggressive attitude toward lesions of this type. Since malignant lesions cannot be differentiated from those of less serious appearance, exploration is advisable.

BOOK REVIEWS

Old Age in the Modern World: Report of the Third Congress of the International Association of Gerontology, London, 1954. [Congress of International Association of Gerontology held in London in July, 1954, was organized with financial help of Council for International Organizations of Medical Sciences, organization subsidized by World Health Organization and UNESCO.] Cloth $8. Pp. 647, with illustrations. Williams & Wilkins Company, Mount Royal and Guilford Aves., Baltimore 2; E. & S. Livingstone, Ltd., 16 and 17 Teviot Pl., Edinburgh 1, Scotland, 1955.

In selecting the papers to be published in this volume, the publishing committee gave preference to those containing original material, opening up new avenues of thought, or presenting authoritative reviews. Those papers relating to work already published or known to be in press are referred to by title only. This volume covers such subjects as age and society, nutritional aspects of aging, endocrinology, employment of older workers, community activities, and education for later maturity. The experiences, observations, and thinking of many workers concerning various aspects of the problem of aging are presented. Important scientific data on physiological, chemical, and psychological changes taking place in old age as well as performance data under various conditions are included. The sociological and philosophical aspects of aging are discussed. This volume presents an up-to-date cross section of the work of gerontologists throughout the world. It is a reference standard of what they knew and were doing as of July, 1954. It is one of the most important books on this general subject that has been published.

Premature Infants: A Manual for Physicians. By Ethel C. Dunham, M.D., Director, Division of Research in Child Development, U. S. Children's Bureau, Washington, D. C. Second edition. Cloth. $8. Pp. 459, with 42 illustrations, Paul B. Hoeber, Inc. (medical book department of Harper & Brothers), 49 E. 33rd St., New York 16, 1955.

This outstanding book is not only a valuable textbook but also an excellent reference book that should be useful to everyone interested in prematurity. The first section, dealing with general considerations, gives the background necessary to acquaint the reader with the general problems of prematurity. The problem of prematurity is still so confusing that even the criteria for defining prematurity have not been clearly established. The author believes that the most practical guide for prematurity for the clinician is birth weight even though it is not an exact indication of the degree of prematurity. This book comes closer to establishing these criteria than anything published to date. Dr. Dunham also covers the latest accepted concepts on the factors influencing the incidence of prematurity and points out the causes and methods of its prevention. In this section she reviews the most important literature published today and recommends that "programs for the prevention of premature birth need to be organized with coordination of prenatal, labor and delivery care." She also believes that "in these efforts medical, nursing and welfare organizations should cooperate with public health and welfare programs." She discusses the gross inaccuracies of the present data on the survival rate and the standards for prognosis on the premature infant. Most of the published data in this field are inadequate, and there is a great need for standards and improved evaluations of the data accumulated. Relatively few studies have been made in the field of emotional disturbances of the premature infant, and "a clearer understanding of these problems is needed with a view of developing methods of preventing them."

The second part of the book deals with clinical considerations of the premature infant. This section takes the premature infant through all the hazards from the time of conception to the time of discharge from the hospital. The author calls attention to the various observations that clinicians should make in order to evaluate the premature infant's condition and to determine its prognosis. The chances of survival of the premature infant will be greatly enhanced by expert care in the delivery room. Expert medical and nursing care as well as suitable equipment and environmental conditions are most essential for this type of infant. The author points out all the important major accepted procedures for the care of the premature infant in the delivery room, during the first 24 hours, and thereafter, covering methods of feeding, medical care, type of clothing, and even psychological aspects of care and criteria for discharge of the infant from the hospital. An entire chapter is devoted to the feeding of the premature infant, outlining its nutritional handicaps and requirements and evaluating the various methods of feeding that are used today. Dr. Dunham urges a conservative attitude in the care of the premature infant and believes that maintenance of life should take precedence over anxiety to establish weight gains. The chapter on abnormal conditions and birth injuries discusses the incidence of these conditions and their effects on the survival rate, diagnostic criteria, and therapeutic approach.

Part three deals with public health considerations. In this section the author evaluates statistical information as to the mortality rate due to prematurity and points out many of its fallacies. She finds that certified death reports of most premature infants indicate no cause of death other than prematurity, which is misleading, and she urges that an accurate postmortem examination be made by competent pathologists in order to determine the exact cause of death, so that the results will be meaningful. In this final section she discusses the maternal factors influencing the mortality rate of premature infants and concludes that the following factors play an important role: (1) the mother's age and parity; (2) complications of pregnancy, labor, and delivery; (3) nonobstetric complications; and (4) the mother's economic and nutritional status. Dr. Dunham concludes that adequate and competent prenatal care is of primary importance in preventing complications of pregnancy or in prolonging pregnancy safely until the infant is sufficiently mature to have a good chance of survival. Medical and nursing care in the immediate neonatal period and later care under suitable conditions are of vital importance. The book ends with a thorough discussion of health programs on state, city, and hospital levels and recommends methods for developing statistics on prematurity and neonatal mortality, techniques for feeding, and special standards for hospital care. This book is a "must" for all who are particularly interested in hebdomadal deaths.

Psychopathology and Education of the Brain-Injured Child. Volume II: Progress in Theory and Clinic. By Alfred A. Strauss, President and Director, Cove Schools for Brain-Injured Children, Racine, Wisconsin, and Evanston, Illinois, and Newell C. Kephart, Professor of Psychology, Purdue University, Lafayette, Ind. In collaboration with Laura E. Lehtinen and Samuel Goldenberg. Cloth. $6. Pp. 266, with 37 drawings by Caspar Henselmann, Grune & Stratton, Inc., 381 Fourth Ave., New York 16; 99 Great Russell St., London, W.C.1, England, 1955.

The work that Dr. Strauss has done with children with brain injuries during the past 15 years is well known. The present volume gives a theoretical formulation of the neurophysiological functions and dysfunctions that probably underlie the disorders of behavior and of mental life exhibited by children who suffer from cerebral palsy. Present-day formulations of the mental processes underlying normal perception, language, conceptualization, and behavior are presented. Against these backgrounds the psychopathology of the child with a brain injury is presented. The clinical psychological examination and bases for educational procedures are presented, together with scoring guides to certain mental tests. The chapter entitled Conclusions Affecting Education of Brain-Injured Children by L. E. Lehtinen is excellent. It provides information and advice that should be welcome to physicians and parents. The final chapter, entitled Essays on Mental Functioning of Brain-Injured Children, presents the speculative organization of neurology and psychophysiology that the authors have developed to guide them in their educational efforts and further research. This monograph is a contribution to present-day knowledge. It should be of value to the physician, the educator, and the clinical psychologist.

These book reviews have been prepared by competent authorities but do not represent the opinions of any medical or other organization unless specifically so stated.

QUERIES AND MINOR NOTES

REGENERATION OF THE TIBIA

To the Editor:—*A 2-year-old boy has been suffering for three months from osteomyelitis of the right tibia with metastatic pulmonary empyema that was drained. A few days ago his tibia, except for proximal and distal epiphyses, was removed. The fibula is intact. Periosteum of tibia was not removed. The boy's leg is now in a cast. 1. Could a new tibia be built by the periosteum? 2. If this could not happen, should a new tibia be grafted and when? What should be used as a graft? Could his parents be donors for a new tibia?*

M.D., Formosa.

Answer.—If the proximal and distal epiphyses are intact and if the transverse plate of growth cartilage, which is between each epiphysis and the shaft of a long bone, has not been too badly damaged, there is a good chance that the tibia will regenerate. If this does not happen, there would be no use of grafting a new tibia in a child at this age. The new tibia would not grow unless the epiphysial cartilage plate is still there and in a healthy condition. If the epiphysial cartilage plate can be demonstrated by x-ray or otherwise to be intact, and if the infection has been completely healed for a period of several months, a new bone graft should be tried. This bone could be the fibula of one of the parents or a full-thickness, 0.75-in. wide tibial bone graft from one of the parents. The best prospects, however, for this patient would be in the regeneration, from the periosteal-attached fragments, of a new tibia.

CYANOSIS DUE TO NITROGEN CONTENT OF WATER

To the Editor:—*Can a rather heavy nitrogen content in drinking water be detrimental for babies and young children? Not knowing, I have advised several parents to use distilled water for their younger children.*

Leon G. Campbell, M.D., Pasadena, Calif.

Answer.—You have advised correctly in prescribing distilled water instead of the well water for use by infants and young children, especially in preparing milk formula for infants. The chemical analysis indicates 2.72 mEq. per liter of nitrate (NO_3) as being present in the water, which is the same as 168.6 ppm of nitrate. The upper limit of safe water for the purpose of preparing milk mixtures for infants is 10 ppm. Some authorities, however, state that even 20 ppm may be present without causing serious difficulty. The danger of a high nitrate content of water is the development of cyanosis due to methemoglobin formation. The nitrates of water are believed to be converted to nitrites, and one molecule of nitrite combines with two molecules of hemoglobin to form methemoglobin. Cyanosis of this type is not relieved by oxygen administration, but it readily disappears when use of high nitrate containing water is discontinued.

EOSINOPHIL COUNTS

To the Editor:—*I am interested in data about the relation between eosinophil count in the venous blood versus the capillary blood.*

M.D., Ohio.

Answer.—It has generally been assumed on the basis of preliminary laboratory observations that the eosinophil counts of venous and capillary blood are quite similar (*Acta psychiat. et neurol.* suppl. 40, 1947, and *Lancet* **1**:129, 1952), but that greater consistency obtains with the use of venous blood (*J. A. M. A.* **151**:702 [Feb. 28] 1953). This consultant does not know of any recent critical studies of these assumptions. A method has been proposed to give reproducible eosinophil counts from free-flowing capillary blood (*Blood* **7**:1020, 1952), but no comparison is made with simultaneous venous blood samples from the same patients. This technique could be applied with equally good results to venous blood samples. In unpublished observations of simultaneous venous and arterial blood eosinophil counts on 16 resting patients (Muehrcke, R. C.: Master's thesis, Chicago, University of Illinois College of Medicine, 1952) eosinophil counts in the arterial blood averaged about 90% of those in the venous blood. On the average, free-flowing capillary blood would thus be expected to show a very comparable but slightly lower value than corresponding venous blood.

TETANUS IMMUNIZATION

To the Editor:—*Recently an orthopedic surgeon in discussing the value of tetanus toxoid over tetanus antiserum said that alum-precipitated toxoids gave the best protection, but he was not sure whether it or plain tetanus toxoid should be used in adults. Years ago a patient had a booster shot using alum-precipitated toxoid and had a chill with a high fever a few hours later. It is important to know which of these types to use as a booster shot on an individual who is severely injured. Would you please advise me.* *M.D., Oklahoma.*

Answer.—Originally the use of toxoids in immunization procedures was not advised for those who were over 10 years of age. This warning was given because of the possibility of severe reactions in persons beyond the period of childhood. Alum-precipitated toxoids are believed to convey a more enduring immunity than fluid toxoids. Because of the slower absorption of the former their action is more prolonged, but active immunity may be established more quickly with fluid toxoid. At present the toxoids are more highly refined than formerly and are in common usage for individuals of all ages. However, as a precaution a toxoid sensitivity (Moloney) test can be made. This is an intradermal test with diluted (1:10 or 1:20) toxoid and is read at the end of 48 hours. For basic tetanus immunization the Medical Service of the United States and the departments of the Army, Navy, and Air Force give three intramuscular injections of alum-precipitated tetanus toxoid at intervals of from one to two months. Each dose is usually 0.5 cc. If an injured person has been adequately protected by active immunization, a booster dose of fluid toxoid should obviate the need of tetanus antitoxin, although the latter is sometimes administered when the injury is extremely severe.

LOSS OF POTENCY FOLLOWING PROSTATIC RESECTION

To the Editor:—*A 69-year-old man had a partial transurethral resection of the prostate two and a half years ago. He became impotent one year ago but is in good physical condition otherwise. Blood pressure is 155/84 mm. Hg. Is it safe to give testosterone propionate or anything else there is to help regain his potency?*

M.D., California.

Answer.—There is absolutely no evidence to show that male hormone injection will in any way bring about or precipitate carcinoma of the prostate. If the tissue removed at the time of the transurethral resection was definitely that of benign hyperplasia, there would be no danger in giving him testosterone propionate. Whether or not his potency will be favorably affected by testosterone propionate is another matter. There are some people who believe that testosterone propionate in large doses will help reestablish virility once it has waned. Such has not been the experience of this consultant who has tried this in a large series of patients. Since the new fortified testosterone propionate can be given in doses of 100 mg. per cubic centimeter it would do no harm to try injecting this once a week for a period of six weeks.

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any medical or other organization unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

BOOK REVIEWS

Old Age in the Modern World: Report of the Third Congress of the International Association of Gerontology, London, 1954. [Congress of International Association of Gerontology held in London in July, 1954, was organized with financial help of Council for International Organizations of Medical Sciences, organization subsidized by World Health Organization and UNESCO.] Cloth. $8. Pp. 647, with illustrations. Williams & Wilkins Company, Mount Royal and Guilford Aves., Baltimore 2; E. & S. Livingstone, Ltd., 16 and 17 Teviot Pl., Edinburgh 1, Scotland, 1955.

In selecting the papers to be published in this volume, the publishing committee gave preference to those containing original material, opening up new avenues of thought, or presenting authoritative reviews. Those papers relating to work already published or known to be in press are referred to by title only. This volume covers such subjects as age and society, nutritional aspects of aging, endocrinology, employment of older workers, community activities, and education for later maturity. The experiences, observations, and thinking of many workers concerning various aspects of the problem of aging are presented. Important scientific data on physiological, chemical, and psychological changes taking place in old age as well as performance data under various conditions are included. The sociological and philosophical aspects of aging are discussed. This volume presents an up-to-date cross section of the work of gerontologists throughout the world. It is a reference standard of what they knew and were doing as of July, 1954. It is one of the most important books on this general subject that has been published.

Premature Infants: A Manual for Physicians. By Ethel C. Dunham, M.D., *Director, Division of Research in Child Development, U. S. Children's Bureau, Washington, D. C.* Second edition. Cloth. $8. Pp. 459, with 42 illustrations. Paul B. Hoeber, Inc. (medical book department of Harper & Brothers), 49 E. 33rd St., New York 16, 1955.

This outstanding book is not only a valuable textbook but also an excellent reference book that should be useful to everyone interested in prematurity. The first section, dealing with general considerations, gives the background necessary to acquaint the reader with the general problems of prematurity. The problem of prematurity is still so confusing that even the criteria for defining prematurity have not been clearly established. The author believes that the most practical guide for prematurity for the clinician is birth weight even though it is not an exact indication of the degree of prematurity. This book comes closer to establishing these criteria than anything published to date. Dr. Dunham also covers the latest accepted concepts on the factors influencing the incidence of prematurity and points out the causes and methods of its prevention. In this section she reviews the most important literature published today and recommends that "programs for the prevention of premature birth need to be organized with coordination of prenatal, labor and delivery care." She also believes that "in these efforts medical, nursing and welfare organizations should cooperate with public health and welfare programs." She discusses the gross inaccuracies of the present data on the survival rate and the standards for prognosis on the premature infant. Most of the published data in this field are inadequate, and there is a great need for standards and improved evaluations of the data accumulated. Relatively few studies have been made in the field of emotional disturbances of the premature infant, and "a clearer understanding of these problems is needed with a view of developing methods of preventing them."

The second part of the book deals with clinical considerations of the premature infant. This section takes the premature infant through all the hazards from the time of conception to the time of discharge from the hospital. The author calls attention to the various observations that clinicians should make in order to evaluate the premature infant's condition and to determine its prognosis. The chances of survival of the premature infant will be greatly enhanced by expert care in the delivery room. Expert medical and nursing care as well as suitable equipment and environmental conditions are most essential for this type of infant. The author points out all the important major accepted procedures for the care of the premature infant in the delivery room, during the first 24 hours, and thereafter, covering methods of feeding, medical care, type of clothing, and even psychological aspects of care and criteria for discharge of the infant from the hospital. An entire chapter is devoted to the feeding of the premature infant, outlining its nutritional handicaps and requirements and evaluating the various methods of feeding that are used today. Dr. Dunham urges a conservative attitude in the care of the premature infant and believes that maintenance of life should take precedence over anxiety to establish weight gains. The chapter on abnormal conditions and birth injuries discusses the incidence of these conditions and their effects on the survival rate, diagnostic criteria, and therapeutic approach.

Part three deals with public health considerations. In this section the author evaluates statistical information as to the mortality rate due to prematurity and points out many of its fallacies. She finds that certified death reports of most premature infants indicate no cause of death other than prematurity, which is misleading, and she urges that an accurate postmortem examination be made by competent pathologists in order to determine the exact cause of death, so that the results will be meaningful. In this final section she discusses the maternal factors influencing the mortality rate of premature infants and concludes that the following factors play an important role: (1) the mother's age and parity; (2) complications of pregnancy, labor, and delivery; (3) nonobstetric complications; and (4) the mother's economic and nutritional status. Dr. Dunham concludes that adequate and competent prenatal care is of primary importance in preventing complications of pregnancy or in prolonging pregnancy safely until the infant is sufficiently mature to have a good chance of survival. Medical and nursing care in the immediate neonatal period and later care under suitable conditions are of vital importance. The book ends with a thorough discussion of health programs on state, city, and hospital levels and recommends methods for developing statistics on prematurity and neonatal mortality, techniques for feeding, and special standards for hospital care. This book is a "must" for all who are particularly interested in hebdomadal deaths.

Psychopathology and Education of the Brain-Injured Child. Volume II: Progress in Theory and Clinic. By Alfred A. Strauss, President and Director, Cove Schools for Brain-Injured Children, Racine, Wisconsin, and Evanston, Illinois, and Newell C. Kephart, Professor of Psychology, *Purdue University, Lafayette, Ind. In collaboration with* Laura E. Lehtinen and Samuel Goldenberg. Cloth. $6. Pp. 266, with 37 drawings by Caspar Henselmann. Grune & Stratton, Inc., 381 Fourth Ave., New York 16; 99 Great Russell St., London, W.C.1, England, 1955.

The work that Dr. Strauss has done with children with brain injuries during the past 15 years is well known. The present volume gives a theoretical formulation of the neurophysiological functions and dysfunctions that probably underlie the disorders of behavior and of mental life exhibited by children who suffer from cerebral palsy. Present-day formulations of the mental processes underlying normal perception, language, conceptualization, and behavior are presented. Against these backgrounds the psychopathology of the child with a brain injury is presented. The clinical psychological examination and bases for educational procedures are presented, together with scoring guides to certain mental tests. The chapter entitled Conclusions Affecting Education of Brain-Injured Children by L. E. Lehtinen is excellent. It provides information and advice that should be welcome to physicians and parents. The final chapter, entitled Essays on Mental Functioning of Brain-Injured Children, presents the speculative organization of neurology and psychophysiology that the authors have developed to guide them in their educational efforts and further research. This monograph is a contribution to present-day knowledge. It should be of value to the physician, the educator, and the clinical psychologist.

These book reviews have been prepared by competent authorities but do not represent the opinions of any medical or other organization unless specifically so stated.

QUERIES AND MINOR NOTES

REGENERATION OF THE TIBIA

To the Editor:—*A 2-year-old boy has been suffering for three months from osteomyelitis of the right tibia with metastatic pulmonary empyema that was drained. A few days ago his tibia, except for proximal and distal epiphyses, was removed. The fibula is intact. Periosteum of tibia was not removed. The boy's leg is now in a cast. 1. Could a new tibia be built by the periosteum? 2. If this could not happen, should a new tibia be grafted and when? What should be used as a graft? Could his parents be donors for a new tibia?*

M.D., Formosa.

Answer.—If the proximal and distal epiphyses are intact and if the transverse plate of growth cartilage, which is between each epiphysis and the shaft of a long bone, has not been too badly damaged, there is a good chance that the tibia will regenerate. If this does not happen, there would be no use of grafting a new tibia in a child at this age. The new tibia would not grow unless the epiphysial cartilage plate is still there and in a healthy condition. If the epiphysial cartilage plate can be demonstrated by x-ray or otherwise to be intact, and if the infection has been completely healed for a period of several months, a new bone graft should be tried. This bone could be the fibula of one of the parents or a full-thickness, 0.75-in. wide tibial bone graft from one of the parents. The best prospects, however, for this patient would be in the regeneration, from the periosteal-attached fragments, of a new tibia.

CYANOSIS DUE TO NITROGEN CONTENT OF WATER

To the Editor:—*Can a rather heavy nitrogen content in drinking water be detrimental for babies and young children? Not knowing, I have advised several parents to use distilled water for their younger children.*

Leon G. Campbell, M.D., Pasadena, Calif.

Answer.—You have advised correctly in prescribing distilled water instead of the well water for use by infants and young children, especially in preparing milk formula for infants. The chemical analysis indicates 2.72 mEq. per liter of nitrate (NO_3) as being present in the water, which is the same as 168.6 ppm of nitrate. The upper limit of safe water for the purpose of preparing milk mixtures for infants is 10 ppm. Some authorities, however, state that even 20 ppm may be present without causing serious difficulty. The danger of a high nitrate content of water is the development of cyanosis due to methemoglobin formation. The nitrates of water are believed to be converted to nitrites, and one molecule of nitrite combines with two molecules of hemoglobin to form methemoglobin. Cyanosis of this type is not relieved by oxygen administration, but it readily disappears when use of high nitrate containing water is discontinued.

EOSINOPHIL COUNTS

To the Editor:—*I am interested in data about the relation between eosinophil count in the venous blood versus the capillary blood.*

M.D., Ohio.

Answer.—It has generally been assumed on the basis of preliminary laboratory observations that the eosinophil counts of venous and capillary blood are quite similar (*Acta psychiat. et neurol.* suppl. 40, 1947, and *Lancet* 1:129, 1952), but that greater consistency obtains with the use of venous blood (*J. A. M. A.* **151:**702 [Feb. 28] 1953). This consultant does not know of any recent critical studies of these assumptions. A method has been proposed to give reproducible eosinophil counts from free-flowing capillary blood (*Blood* **7:**1020, 1952), but no comparison is made with simultaneous venous blood samples from the same patients. This technique could be applied with equally good results to venous blood samples. In unpublished observations of simultaneous venous and arterial blood eosinophil counts on 16 resting patients (Muehrcke, R. C.: Master's thesis, Chicago, University of Illinois College of Medicine, 1952) eosinophil counts in the arterial blood averaged about 90% of those in the venous blood. On the average, free-flowing capillary blood would thus be expected to show a very comparable but slightly lower value than corresponding venous blood.

TETANUS IMMUNIZATION

To the Editor:—*Recently an orthopedic surgeon in discussing the value of tetanus toxoid over tetanus antiserum said that alum-precipitated toxoids gave the best protection, but he was not sure whether it or plain tetanus toxoid should be used in adults. Years ago a patient had a booster shot using alum-precipitated toxoid and had a chill with a high fever a few hours later. It is important to know which of these types to use as a booster shot on an individual who is severely injured. Would you please advise me.*

M.D., Oklahoma.

Answer.—Originally the use of toxoids in immunization procedures was not advised for those who were over 10 years of age. This warning was given because of the possibility of severe reactions in persons beyond the period of childhood. Alum-precipitated toxoids are believed to convey a more enduring immunity than fluid toxoids. Because of the slower absorption of the former their action is more prolonged, but active immunity may be established more quickly with fluid toxoid. At present the toxoids are more highly refined than formerly and are in common usage for individuals of all ages. However, as a precaution a toxoid sensitivity (Moloney) test can be made. This is an intradermal test with diluted (1:10 or 1:20) toxoid and is read at the end of 48 hours. For basic tetanus immunization the Medical Service of the United States and the departments of the Army, Navy, and Air Force give three intramuscular injections of alum-precipitated tetanus toxoid at intervals of from one to two months. Each dose is usually 0.5 cc. If an injured person has been adequately protected by active immunization, a booster dose of fluid toxoid should obviate the need of tetanus antitoxin, although the latter is sometimes administered when the injury is extremely severe.

LOSS OF POTENCY FOLLOWING PROSTATIC RESECTION

To the Editor:—*A 69-year-old man had a partial transurethral resection of the prostate two and a half years ago. He became impotent one year ago but is in good physical condition otherwise. Blood pressure is 155/84 mm. Hg. Is it safe to give testosterone propionate or anything else there is to help regain his potency?*

M.D., California.

Answer.—There is absolutely no evidence to show that male hormone injection will in any way bring about or precipitate carcinoma of the prostate. If the tissue removed at the time of the transurethral resection was definitely that of benign hyperplasia, there would be no danger in giving him testosterone propionate. Whether or not his potency will be favorably affected by testosterone propionate is another matter. There are some people who believe that testosterone propionate in large doses will help reestablish virility once it has waned. Such has not been the experience of this consultant who has tried this in a large series of patients. Since the new fortified testosterone propionate can be given in doses of 100 mg. per cubic centimeter it would do no harm to try injecting this once a week for a period of six weeks.

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any medical or other organization unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

AROSINUSITIS

THE EDITOR:—*During an air flight from Montreal, Canada, to Boston on a sunny and hot summer day (90 F temperature) a woman had a frightening experience. When the plane began to lose altitude preparatory to landing she suffered a severe pain "at the hairline over the forehead." She described the pain as being intense for several minutes, improving slightly, then becoming worse again, and finally decreasing to about half the intensity when the plane landed. The pain persisted at this intensity for about five hours and was practically gone after a night's rest, although there was a mild ache above the left eye and over the forehead. When the pain first started she thought she was going to die. In addition, she complained of a visual disturbance like a "blacking out" and this soon disappeared. She pointed to the area of the left frontal sinus, particularly, but said that it seemed to go across the entire forehead and up to the hairline. She seemed none the worse for her experience 24 hours later. I will appreciate information regarding such an experience.*

M.D., Massachusetts.

ANSWER.—The symptoms described most likely occurred due to a brief episode of barosinusitis, more especially the left frontal sinus. The basic cause of this difficulty is the pressure differential of air entrapped in the sinus and the ambient pressure of the atmosphere the patient is breathing. This could be expected to occur with descent of the aircraft preparatory to landing. The most common symptom accompanying barosinusitis is an extremely sharp pain or stinging sensation. The location of the pain depends on which sinuses are affected. Most frequently the frontal sinus will be involved, then the maxillary sinus. The pain is usually of sudden onset and severe intensity during descent. As a rule, the pain continues from time of onset until time of landing, but occasionally it persists or recurs for some hours or several days. A difference of pressure of the air contained within a sinus and that of the atmosphere will result if the sinus ostium is occluded by any developmental or acquired formation that acts as a valve and so permits air flow through the ostium in one direction only. The most common contributing factor is the presence of upper respiratory infection.

DERMATITIS DURING PREGNANCY

TO THE EDITOR:—*A gravida 5 para 3 woman, aged 37, following the birth of her first child, broke out with hives on the ninth postpartum day. On the 10th postpartum day for her second child she developed a general eczematoid dermatitis that was resistive to antiallergic therapy but finally disappeared about the fourth month post partum. Her third pregnancy ended in the fourth month in a spontaneous abortion. Following the birth of her third child she again developed a general eczematoid dermatitis. Both of these were preceded by two days of general urticaria. She has nursed all her babies. She is now entering her fourth month of pregnancy. Can we do anything to prevent a recurrence of the dermatitis? Could lactation have anything to do with it?*

M.D., Connecticut.

This inquiry was referred to two consultants, whose respective replies follow.—ED.

ANSWER.—It is difficult to decide on the cause of the skin reactions that developed in this patient. The hormones produced by the placenta may be responsible, in which case there is no prophylactic therapy. If drugs have been given before delivery they may be responsible. Likewise, in rare instances, an anesthetic agent may be the cause. It is not likely that lactation is responsible, but occasionally drugs and special foods taken to increase the milk supply may produce a skin reaction.

ANSWER.—If it may be assumed that both contact dermatitis and drug eruption have been ruled out, diagnoses such as dermatitis herpetiformis and hypersensitivity to either placental products or to the patient's milk must be considered. The latter two conditions are exceedingly rare. For the other conditions therapy with corticosteroids should be helpful provided too there are no contraindications to their use. Coupled with the use of bland topical agents, such therapy should prove effective quickly.

RECURRENT PAROTITIS

TO THE EDITOR:—*What can be the cause of repeated swellings in the parotid gland region in a boy now aged 14? He says that he has had mumps, but on several occasions the parotid glands have been symmetrically enlarged. Last spring he ran a low temperature during the attack. Now he has enlargements on either side, but the swellings are limited by the lower jaws. There is no postaural swelling. His teeth are normal.*

S. B. Ross, M.D., Brewster, N. Y.

ANSWER.—Recurrent parotitis is a recognized condition, the etiology of which is not related to mumps. Attacks may occur at intervals of weeks or months and the swelling may involve one or both parotids. The general health of the patient may be excellent with no evidence of throat or tonsil infections. However, Micrococcus (Staphylococcus) aureus may be found in pus that can be expelled from Stensen's duct by massaging the parotid gland. But Bigler (Recurrent Parotitis, *M. Clin. North America* 30:97 [Jan.] 1946) has reported 60 cases, and in every instance Streptococcus viridans was cultured from pus at the duct opening. The disease may vary greatly. There may be little or no elevation of temperature. There is no specific treatment. X-ray therapy has been resorted to with questionable results.

PALPATION OF POPLITEAL ARTERY

TO THE EDITOR:—*How do you feel for the popliteal arteries in cases of arteriosclerosis in the leg arteries?*

G. L. Lester, M.D., Chautauqua, N. Y.

ANSWER.—Palpation of the popliteal artery may be simple in thin individuals, but the vessel, even although it is patent and pulsates well, may not be felt because of accumulation of fat in the popliteal space. One can feel for this pulse with the knee flexed at right angles by placing both thumbs firmly over the patella and pressing the third and fourth fingers of both hands deeply into the popliteal space. Or one can put the patient in a prone position then bend the knee at right angles and feel for the pulse with the second and third fingers of the right hand. If one really wants to be sure that the artery is occluded at popliteal level, a simple oscillometer will show large oscillations above the knee and no or feeble oscillations below the knee. This makes really a clear-cut diagnosis. Of course the extent of arteriosclerotic occlusion and the pattern of collateral blood supply can only be ascertained by femoral arteriogram.

PARTIAL GASTRECTOMY

TO THE EDITOR:—*Is there a likelihood of a marked diminution in the intrinsic factor developing following partial gastrectomy? Are such patients prone to develop severe anemia in three to five months?*

Emerson F. Hoover, M.D., San Diego, Calif.

ANSWER.—A marked deficiency of the intrinsic factor would lead to vitamin B_{12} deficiency, and the anemia occurring would be megaloblastic and would respond to parenteral injections of vitamin B_{12}. The development of megaloblastic anemia following partial gastrectomy is rare. The anemia following partial gastrectomy is much more likely to be hypochromic due to iron deficiency. Patients who have had a total gastrectomy may develop megaloblastic anemia three to five years after surgery, and totally gastrectomized patients should be given 30 mcg. of vitamin B_{12} subcutaneously every three weeks.

UREMIC PNEUMONITIS

TO THE EDITOR:—*What is the mechanism responsible for red blood cells within the pulmonary alveoli in the terminal stage of uremia, so-called uremic pneumonitis?*

Phillip E. Rothman, M.D., Beverly Hills, Calif.

ANSWER.—This mechanism is unknown, as indeed is that of uremic pneumonitis. Conceivably, the pneumonitis may be related to local irritation from ammonia liberated from the urea-rich bronchial fluids by bacterial urease, and the hemorrhagic exudate reflects th[illegible] of local reaction, increased perhaps by hemorrhagic [illegible] in advanced uremia.

MANAGEMENT OF METASTATIC MAMMARY CANCER

Olof H. Pearson, M.D., Min C. Li, M.D., John P. Maclean, M.D., Mortimer B. Lipsett, M.D.
and
Charles D. West, M.D., New York

The majority of women with primary breast cancer eventually develop dissemination of their disease despite mastectomy and prophylactic radiation therapy. This indicates that metastasis occurs early. The progession of the metastatic cancer, however, is extremely variable. In some cases there is rapid growth and dissemination of the tumor, whereas in others the cancer appears to lie dormant for several years before the metastases manifest themselves. There is no satisfactory explanation for the variable course of this disease.

Palliative therapy constitutes an important aspect in the management of patients with breast cancer. X-ray therapy and endocrine treatment provide effective palliation in many patients with metastatic breast cancer. Not only do these modalities afford relief of symptoms but in many cases the growth of the cancer is temporarily arrested, thus providing prolongation of useful life. It is the purpose of this paper to review the endocrine treatment of metastatic breast cancer and to outline the sequence of therapy that is most likely to yield optimum results.

OOPHORECTOMY

Oophorectomy induces objective remissions in about 44% of premenopausal women with metastatic breast cancer and constitutes the optimal initial treatment for these patients.[1] The remissions average nine months in duration, with a median period of six and one-half months. It has been demonstrated that oophorectomy induces its benefit by removal of the major endogenous source of estrogen.[2] Approximately one-half of the patients have non-estrogen-dependent tumors and fail to obtain improvement from castration.

No practical means for selecting patients for oophorectomy has been found. Neither the histological picture of the cancer nor any clinical manifestation of the disease has been helpful in predicting a favorable response. Thus, oophorectomy is undertaken with only an approximate 50% expectation of benefit. Oophorectomy will occasionally produce improvement in postmenopausal women, but it cannot be recommended, since the yield of beneficial results is too small. Patients who fail to respond to oophorectomy are unlikely to benefit from other forms of endocrine therapy. Administration of cortisone or an estrogen preparation is occasionally beneficial, and hypophysectomy is being explored as a means of helping these patients.

ADRENALECTOMY

Of 38 women with metastatic breast cancer, all of whom had previously been oophorectomized, bilateral adrenalectomy produced objective remissions in 45%.[1] The average duration of the remissions was nine months, with a median of seven months. Adrenalectomy appears to produce benefit by removal of another source of endogenous estrogens. Thus, patients who have obtained a beneficial response from castration are likely to have a second remission from adrenalectomy. Patients who fail to benefit from oophorectomy also fail to respond to adrenalectomy. Knowledge of the initial response to oophorectomy provides the best means of selecting patients for adrenalectomy.

In 25 postmenopausal women, combined oophorectomy and adrenalectomy in one stage produced objective remissions in 16 cases.[3] (Of these 25 patients, 15 had spontaneous menopause and 10 had artificially induced menopause. Twelve of the 15 with spontaneous menopause and 4 of the 10 with artificial menopause had remissions.) The average duration of the remissions exceeds eight months (eight patients are still in remission at present). These observations suggest that in approximately 50% of cases, in all age groups, mammary cancer is estrogen-dependent and will respond

BAROSINUSITIS

To the Editor:—*During an air flight from Montreal, Canada, to Boston on a sunny and hot summer day (90 F temperature) a woman had a frightening experience. When the plane began to lose altitude preparatory to landing she suffered a severe pain "at the hairline over the forehead." She described the pain as being intense for several minutes, improving slightly, then becoming worse again, and finally decreasing to about half the intensity when the plane landed. The pain persisted at this intensity for about five hours and was practically gone after a night's rest, although there was a mild ache above the left eye and over the forehead. When the pain first started she thought she was going to die. In addition, she complained of a visual disturbance like a "blacking out" and this soon disappeared. She pointed to the area of the left frontal sinus, particularly, but said that it seemed to go across the entire forehead and up to the hairline. She seemed none the worse for her experience 24 hours later. I will appreciate information regarding such an experience.*

M.D., Massachusetts.

Answer.—The symptoms described most likely occurred due to a brief episode of barosinusitis, more especially the left frontal sinus. The basic cause of this difficulty is the pressure differential of air entrapped in the sinus and the ambient pressure of the atmosphere the patient is breathing. This could be expected to occur with descent of the aircraft preparatory to landing. The most common symptom accompanying barosinusitis is an extremely sharp pain or stinging sensation. The location of the pain depends on which sinuses are affected. Most frequently the frontal sinus will be involved, then the maxillary sinus. The pain is usually of sudden onset and severe intensity during descent. As a rule, the pain continues from time of onset until time of landing, but occasionally it persists or recurs for some hours or several days. A difference of pressure of the air contained within a sinus and that of the atmosphere will result if the sinus ostium is occluded by any developmental or acquired formation that acts as a valve and so permits air flow through the ostium in one direction only. The most common contributing factor is the presence of upper respiratory infection.

DERMATITIS DURING PREGNANCY

To the Editor:—*A gravida 5 para 3 woman, aged 37, following the birth of her first child, broke out with hives on the ninth postpartum day. On the 10th postpartum day for her second child she developed a general eczematoid dermatitis that was resistive to antiallergic therapy but finally disappeared about the fourth month post partum. Her third pregnancy ended in the fourth month in a spontaneous abortion. Following the birth of her third child she again developed a general eczematoid dermatitis. Both of these were preceded by two days of general urticaria. She has nursed all her babies. She is now entering her fourth month of pregnancy. Can we do anything to prevent a recurrence of the dermatitis? Could lactation have anything to do with it?*

M.D., Connecticut.

This inquiry was referred to two consultants, whose respective replies follow.—Ed.

Answer.—It is difficult to decide on the cause of the skin reactions that developed in this patient. The hormones produced by the placenta may be responsible, in which case there is no prophylactic therapy. If drugs have been given before delivery they may be responsible. Likewise, in rare instances, an anesthetic agent may be the cause. It is not likely that lactation is responsible, but occasionally drugs and special foods taken to increase the milk supply may produce a skin reaction.

Answer.—If it may be assumed that both contact dermatitis and drug eruption have been ruled out, diagnoses such as dermatitis herpetiformis and hypersensitivity to either placental products or to the patient's milk must be considered. The latter two conditions are exceedingly rare. For the other conditions therapy with corticosteroids should be helpful provided too there are no contraindications to their use. Coupled with the use of bland topical agents, such therapy should prove effective quickly.

RECURRENT PAROTITIS

To the Editor:—*What can be the cause of repeated swellings in the parotid gland region in a boy now aged 14? He says that he has had mumps, but on several occasions the parotid glands have been symmetrically enlarged. Last spring he ran a low temperature during the attack. Now he has enlargements on either side, but the swellings are limited by the lower jaws. There is no postaural swelling. His teeth are normal.*

S. B. Ross, M.D., Brewster, N. Y.

Answer.—Recurrent parotitis is a recognized condition, the etiology of which is not related to mumps. Attacks may occur at intervals of weeks or months and the swelling may involve one or both parotids. The general health of the patient may be excellent with no evidence of throat or tonsil infections. However, Micrococcus (Staphylococcus) aureus may be found in pus that can be expelled from Stensen's duct by massaging the parotid gland. But Bigler (Recurrent Parotitis, *M. Clin. North America* 30:97 [Jan.] 1946) has reported 60 cases, and in every instance Streptococcus viridans was cultured from pus at the duct opening. The disease may vary greatly. There may be little or no elevation of temperature. There is no specific treatment. X-ray therapy has been resorted to with questionable results.

PALPATION OF POPLITEAL ARTERY

To the Editor:—*How do you feel for the popliteal arteries in cases of arteriosclerosis in the leg arteries?*

G. L. Lester, M.D., Chautauqua, N. Y.

Answer.—Palpation of the popliteal artery may be simple in thin individuals, but the vessel, even although it is patent and pulsates well, may not be felt because of accumulation of fat in the popliteal space. One can feel for this pulse with the knee flexed at right angles by placing both thumbs firmly over the patella and pressing the third and fourth fingers of both hands deeply into the popliteal space. Or one can put the patient in a prone position then bend the knee at right angles and feel for the pulse with the second and third fingers of the right hand. If one really wants to be sure that the artery is occluded at popliteal level, a simple oscillometer will show large oscillations above the knee and no or feeble oscillations below the knee. This makes really a clear-cut diagnosis. Of course the extent of arteriosclerotic occlusion and the pattern of collateral blood supply can only be ascertained by femoral arteriogram.

PARTIAL GASTRECTOMY

To the Editor:—*Is there a likelihood of a marked diminution in the intrinsic factor developing following partial gastrectomy? Are such patients prone to develop severe anemia in three to five months?*

Emerson F. Hoover, M.D., San Diego, Calif.

Answer.—A marked deficiency of the intrinsic factor would lead to vitamin B_{12} deficiency, and the anemia occurring would be megaloblastic and would respond to parenteral injections of vitamin B_{12}. The development of megaloblastic anemia following partial gastrectomy is rare. The anemia following partial gastrectomy is much more likely to be hypochromic due to iron deficiency. Patients who have had a total gastrectomy may develop megaloblastic anemia three to five years after surgery, and totally gastrectomized patients should be given 30 mcg. of vitamin B_{12} subcutaneously every three weeks.

UREMIC PNEUMONITIS

To the Editor:—*What is the mechanism responsible for red blood cells within the pulmonary alveoli in the terminal stage of uremia, so-called uremic pneumonitis?*

Phillip E. Rothman, M.D., Beverly Hills, Calif.

Answer.—This mechanism is unknown, as indeed is that of uremic pneumonitis. Conceivably, the pneumonitis may be related to local irritation from ammonia liberated from the urea-rich bronchial fluids by bacterial urease, and the hemorrhagic exudate reflects the intensity of local reaction, increased perhaps by hemorrhagic diathesis common in advanced uremia.

MANAGEMENT OF METASTATIC MAMMARY CANCER

Olof H. Pearson, M.D., Min C. Li, M.D., John P. Maclean, M.D., Mortimer B. Lipsett, M.D.
and
Charles D. West, M.D., New York

The majority of women with primary breast cancer eventually develop dissemination of their disease despite mastectomy and prophylactic radiation therapy. This indicates that metastasis occurs early. The progession of the metastatic cancer, however, is extremely variable. In some cases there is rapid growth and dissemination of the tumor, whereas in others the cancer appears to lie dormant for several years before the metastases manifest themselves. There is no satisfactory explanation for the variable course of this disease.

Palliative therapy constitutes an important aspect in the management of patients with breast cancer. X-ray therapy and endocrine treatment provide effective palliation in many patients with metastatic breast cancer. Not only do these modalities afford relief of symptoms but in many cases the growth of the cancer is temporarily arrested, thus providing prolongation of useful life. It is the purpose of this paper to review the endocrine treatment of metastatic breast cancer and to outline the sequence of therapy that is most likely to yield optimum results.

OOPHORECTOMY

Oophorectomy induces objective remissions in about 44% of premenopausal women with metastatic breast cancer and constitutes the optimal initial treatment for these patients.[1] The remissions average nine months in duration, with a median period of six and one-half months. It has been demonstrated that oophorectomy induces its benefit by removal of the major endogenous source of estrogen.[2] Approximately one-half of the patients have non-estrogen-dependent tumors and fail to obtain improvement from castration.

No practical means for selecting patients for oophorectomy has been found. Neither the histological picture of the cancer nor any clinical manifestation of the disease has been helpful in predicting a favorable response. Thus, oophorectomy is undertaken with only an approximate 50% expectation of benefit. Oophorectomy will occasionally produce improvement in postmenopausal women, but it cannot be recommended, since the yield of beneficial results is too small. Patients who fail to respond to oophorectomy are unlikely to benefit from other forms of endocrine therapy. Administration of cortisone or an estrogen preparation is occasionally beneficial, and hypophysectomy is being explored as a means of helping these patients.

ADRENALECTOMY

Of 38 women with metastatic breast cancer, all of whom had previously been oophorectomized, bilateral adrenalectomy produced objective remissions in 45%.[1] The average duration of the remissions was nine months, with a median of seven months. Adrenalectomy appears to produce benefit by removal of another source of endogenous estrogens. Thus, patients who have obtained a beneficial response from castration are likely to have a second remission from adrenalectomy. Patients who fail to benefit from oophorectomy also fail to respond to adrenalectomy. Knowledge of the initial response to oophorectomy provides the best means of selecting patients for adrenalectomy.

In 25 postmenopausal women, combined oophorectomy and adrenalectomy in one stage produced objective remissions in 16 cases.[3] (Of these 25 patients, 15 had spontaneous menopause and 10 had artificially induced menopause. Twelve of the 15 with spontaneous menopause and 4 of the 10 with artificial menopause had remissions.) The average duration of the remissions exceeds eight months (eight patients are still in remission at present). These observations suggest that in approximately 50% of cases, in all age groups, mammary cancer is estrogen-dependent and will respond

favorably to removal of endogenous sources of estrogen. Combined oophorectomy and adrenalectomy is the recommended initial therapy in postmenopausal women. There is no practical method of selecting patients who will benefit from combined oophorectomy and adrenalectomy, and it must be undertaken with an approximate 50% chance of obtaining a favorable response.

HYPOPHYSECTOMY

Total hypophysectomy in man is now an established surgical procedure which can be performed without great risk.[4] Pearson and others have obtained objective remissions from hypophysectomy in women whose breast cancer had become reactivated following oophorectomy and adrenalectomy. This suggests that the growth of some breast cancers may be dependent upon a pituitary hormone (or hormones) in addition to their estrogen dependence. Hypophysectomy not only eliminates pituitary hormones but also produces profound suppression of ovarian and adrenal function, comparable to the surgical removal of these endocrine glands. Thus, hypophysectomy is being explored as the initial endocrine treatment for patients with metastatic breast cancer.

In a series of 58 patients with breast cancer who underwent hypophysectomy, Pearson and others [4b] obtained objective remissions in 54% of 37 cases that could be evaluated. Luft and Olivecrona [4a] have obtained similar results in their series of 37 patients. A further period of observation is required to determine the average duration of hypophysectomy-induced remissions. If hypophysectomy can produce a summation of the beneficial results of oophorectomy, adrenalectomy, and hypophysectomy performed in sequence, then this procedure may become the optimal initial endocrine treatment for metastatic breast cancer.

ANDROGEN

It has been well established that androgen therapy will induce objective improvement in about 23% of women with breast cancer in all age groups. The average duration of the remissions is seven and one-half months, with a median of four and one-half months.[5] The mechanism by which androgen induces remissions is not known, but it has been considered that androgen may neutralize the effects of endogenous estrogen. If this is the mechanism of androgen action, it does not appear to be an efficient neutralizing agent, since in approximately 50% of cases mammary cancer is estrogen-dependent and androgen is effective in only one-half of this number of cases.

It has been demonstrated that androgen may accelerate the growth of mammary cancer in some patients.[6] Recent evidence indicates that androgen can be converted into estrogen in some patients.[7] This offers a possible explanation of why androgen can produce exacerbation of tumor growth.

Since androgen therapy carries the potential of accelerating the growth of breast cancer, and since the percentage of remissions is less than with ablative procedures, it would seem logical to reserve androgen treatment until the disease has relapsed after oophorectomy, adrenalectomy, or hypophysectomy. Androgen therapy is indicated in those patients who cannot tolerate or who refuse ablative therapy.

ESTROGENS

Administration of estrogens has been demonstrated to induce objective remissions in postmenopausal women with breast cancer. The combined results of several clinics [5] showed objective remissions in 44% of the cases. The average duration of the remissions was eight months, with a median of about four and one-half months. It has been well established that estrogens can also accelerate the growth of breast cancer. Since in approximately 50% of cases breast cancer is estrogen-dependent, estrogen is a potential hazard in this group of patients.

The mechanism by which estrogens induce remissions in women with breast cancer has not been established. It is possible that estrogens may induce beneficial effects by suppression of pituitary function.[8] Some breast cancers may depend upon two hormones (e. g., estrogen and growth hormone), and it is possible that estrogens may have dual effects on the growth of the cancer, one to stimulate and the other to suppress, of which either effect might predominate.

Since estrogens are potentially capable of producing harmful effects in about 50% of all women with breast cancer, it would seem wise to restrict their therapeutic use to those patients who fail to respond to castration or to castration and adrenalectomy. Estrogen therapy should be tried cautiously when ablative procedures cannot be done.

CORTISONE

Cortisone, in doses of 200 to 400 mg. a day, will induce objective remissions in about 30% of patients with metastatic breast cancer.[9] The average duration of the remissions is three months. Cortisone in doses of 50 to 75 mg. per day will occasionally produce improvement, but remissions comparable to those obtained with adrenalectomy have not been observed with small doses of cortisone alone.

Cortisone will induce remissions in patients with either estrogen-dependent or non-estrogen-dependent mammary cancer. The mechanism by which cortisone inhibits tumor growth is not known, but it may be due to a direct effect of the hormone on the tumor. Since the remissions induced by cortisone are usually of short duration, it seems best to reserve this therapy for patients who fail to respond to the other modalities of endocrine ther-

apy or who have relapsed after such therapy. Cortisone is also useful in critically ill patients. If a remission can be induced with cortisone therapy, the patient may then be in a suitable condition for other forms of endocrine therapy.

X-RAY THERAPY

X-ray therapy will induce objective regression in up to 75% of individual lesions of metastatic mammary cancer. The duration of the growth-inhibiting effects of radiation is variable, and figures for the average duration of response in different organ sites are not available. Since x-ray therapy induces its effects only in the local area being treated, it is our opinion that endocrine therapy constitutes the optimal initial therapy for metastatic breast cancer. When endocrine therapy induces an objective response, not only is there prompt relief of symptoms from individual lesions but also the growth of all metastatic lesions is temporarily inhibited.

COMMENT

The table summarizes the results of the various forms of endocrine therapy for metastatic breast cancer. In the figure the sequence of endocrine therapy that, at present, appears to offer the optimum therapeutic results is presented. This sequence of therapy will undoubtedly be modified as more experience is accumulated. Thus, if hypophysectomy can produce a summation of the beneficial effects of oophorectomy, adrenalectomy, and hypophysectomy performed in sequence, then hypophysectomy may become the preferred initial treatment. It will also be of interest to determine whether estrogen or androgen administration can produce tumor-inhibiting effects in patients who have failed to respond or who have relapsed after total hypophysectomy.

Results of Endocrine Treatment of Metastatic Breast Cancer

Treatment	Status	Cases, No.	Objective Remissions, %	Duration, Mo.	
				Mean	Median
Oophorectomy [1]	Premenopausal	75	44	9	6.5

Recommended sequence of therapy for metastatic breast cancer.

The possible mechanisms by which alterations in endocrine environment affect the growth of breast cancer have been briefly discussed. The present evidence suggests that the growth of mammary cancer is, in many cases, dependent upon circulating hormones that are secreted from the ovaries, adrenals, and pituitary gland. Removing or lowering the titer of these hormones results in temporary cessation of growth and regression of the cancer. This concept provides a rational physiological basis for treatment.

All forms of endocrine therapy so far studied produce only temporary palliative effects. This suggests that breast tumors are only partially dependent upon hormones for their growth and that biological adaptation can occur whereby the tumor grows in the absence of endocrine stimuli. Endocrine therapy has been reserved for advanced stages of the disease. No information is available to determine whether ablative endocrine therapy might be more effective if carried out earlier in the course of the disease. Greene [10] has presented evidence to suggest that primary malignant tumors are more dependent upon their environment for growth than are tumors that have become disseminated. Thus, studies of endocrine therapy early in the course of the disease are needed before hormone treatment is permanently relegated to the advanced stages.

Whether endocrine therapy significantly prolongs life in those patients with breast cancer who obtain a favorable response has not been rigidly established on the basis of statistics. On the basis of individual experience, there appears to be no question that useful survival is prolonged in most patients who obtain a favorable response. Carefully planned endocrine and radiation therapy constitute worthwhile treatment for many patients with metastatic breast cancer.

SUMMARY

Metastatic mammary cancer in premenopausal women was treated by oophorectomy in 75 cases, and remissions averaging nine months in duration were obtained in 33 cases. In 31 postmenopausal women, the same operation gave remissions in only 2 cases. Adrenalectomy in 38 previously oophorectomized patients was followed by remission in 17 cases, and in 25 postmenopausal patients combined oophorectomy and adrenalectomy gave 16 remissions. Evidence of endocrine influences in early mammary carcinoma led to investigation of effects of hypophysectomy, which gave remissions in 20 out of 37 cases. The duration of this improvement remains to be determined. Treatment with estrogens and androgens gave variable effects, some of them harmful, and the remissions that occasionally followed cortisone were brief. Endocrine therapy, whether by ablation or by hormone administration, has the advantage over roentgenotherapy that its effects, when they are favorable, are not confined to the area treated.

USE OF NITROGEN MUSTARD IN TREATMENT OF SEROUS EFFUSIONS OF NEOPLASTIC ORIGIN

Austin S. Weisberger, M.D., Bennett Levine, M.D.
and
John P. Storaasli, M.D., Cleveland

Effusions into the pleural, peritoneal, or pericardial cavities as a result of metastatic malignancies may be distressing and disabling but are not necessarily immediately fatal. Direct instillation of radioactive colloidal gold is effective in 50 to 67% of cases in decreasing or eliminating the reaccumulation of fluid.[1] There are, however, several disadvantages to the use of radioactive gold. Thus, special facilities are required for its use, and it is difficult to handle. It has a short half-life, it is not universally available, and it is expensive to the patient. In addition, it represents a potential radiation hazard to the patient, doctors, nurses, and technicians. Routine use of radioactive gold therapy is therefore not feasible in most hospitals.

Several reports have shown that direct instillation of nitrogen mustard into malignant effusions may also be effective in decreasing or eliminating reaccumulation of fluid.[2] Experience with use of this drug in this manner has been limited. The total number of cases reported are few, and the period of observation has been short. The purpose of this report is to present the results of direct instillation of nitrogen mustard in 43 patients with malignant effusions treated during the past two years.

MATERIALS AND METHODS

All patients treated had pleural, peritoneal, or pericardial effusions due to metastatic malignant disease. In all instances the malignant origin of the effusion was proved either by the presence of malignant cells in aspirated fluid or by the presence of fluid with the characteristics of an exudate (specific gravity 1.016 or greater and high protein content) in a patient with known malignant disease.

Table 1 shows the type of primary tumor and the site of effusion in the patients treated. There were 30 patients with pleural effusions, 11 patients with peritoneal effusions, and 2 patients with pericardial effusions. Twelve patients had carcinoma of the breast, 10 had ovarian carcinoma, 6 had lymphomas, 3 had bronchiogenic carcinoma, and the remainder had various other types of malignant disease.

Immediately prior to therapy with nitrogen mustard patients were given 0.2 gm. of secobarbital (Seconal) and 50 mg. of chlorpromazine (Thorazine) orally. The therapy with secobarbital was repeated in two hours if necessary for control of nausea and vomiting. In the patients with pleural and peritoneal effusions, nitrogen mustard was administered in a single injection of 0.4 mg. per kilogram of body weight. In the two patients with pericardial effusion, doses of 10 mg. and 22 mg. of nitrogen mustard were used respectively. The nitrogen mustard was prepared immediately preceding injection by adding 10 ml. of isotonic sodium chloride to each 10 mg. vial.

In the treatment of peritoneal effusion, a paracentesis was done in the usual manner and approximately one-half of the fluid removed. While there was still a free flow of fluid, the nitrogen mustard was administered either through a small rubber catheter inserted into the trocar or through a no. 18 needle introduced at another site. A free flow of fluid must be present before instilla-

* ++ indicates no reaccumulation of fluid; +, decreased formation of fluid; 0, no improvement.

A similar procedure was followed for the intrapleural and intrapericardial administration of nitrogen mustard, except that the nitrogen mustard was introduced directly through the needle used to remove the fluid. After administration of the nitrogen mustard, the patient was changed to a new position every 5 or 10 minutes for a period of one hour to insure more uniform distribution of the material throughout the serous cavity. On the day following administration of the nitrogen mustard, paracentesis was repeated and as much fluid removed as possible. The patients were followed closely with x-rays and physical examinations for evidence of reaccumulation of fluid.

RESULTS

Twenty-eight of the 43 patients treated in this manner (65%) were significantly improved. In 20 of the 28 patients there was no reaccumulation of fluid during their remaining course or up to the time of this report. In 8 of the 28 patients there was a marked reduction in the amount of fluid reaccumulating and consequently a decreased requirement for paracentesis. Twenty of these 28 patients are still living at the time of this report, with improvement lasting from 6 to 24 months in 10 patients and 2 to 5 months in 10 patients. The best responses were obtained in patients with carcinomas of the breast or ovary (tables 1 and 2).

TABLE 2.—*Summary of Results Obtained with Intracavitary Administration of Nitrogen Mustard in Malignant Effusions: Results Compared to Type of Tumor*

† 20 complete, 8 partial.

Of those in whom the malignant effusion was completely eradicated, one patient is alive and well 24 months after therapy. Three other patients have survived for longer than 12 months and are still asymptomatic. An additional six patients have remained asymptomatic for periods of 6 to 10 months after therapy.

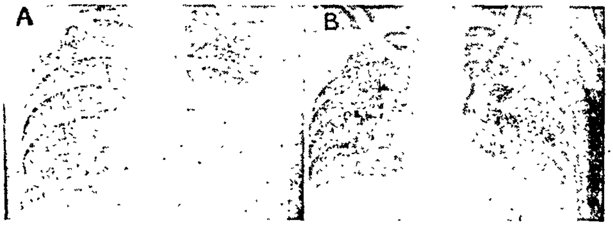

Fig. 1.—*A*, pleural effusion due to metastatic ovarian carcinoma. *B*, complete disappearance of fluid after nitrogen mustard therapy, with no reaccumulation at the time of death, five months later.

Several examples of marked improvement to therapy are shown in figures 1, 2, and 3. Figure 1 shows a case of pleural effusion due to metastatic ovarian carcinoma. There was full disappearance of fluid after therapy with nitrogen mustard, with no reaccumulation at the time of death, five months later. In figure 2 is shown a case of lymphosarcoma with pleural effusion. There has been no reaccumulation of fluid after 24 months, and the patient is still alive and well. The disease has been kept under control with cortisone and local x-ray therapy to the spleen and lymph nodes as needed. Figure 3 shows a case of pericardial and pleural effusion due to metastatic carcinoma of the breast. This patient had signs and symptoms of cardiac tamponade. After treatment with 10 mg. of nitrogen mustard intrapericardially and 0.4 mg. per kilogram of body weight injected into the left pleural cavity, there was disappearance of fluid; the patient is alive and well after 14 months.

Eighteen of 30 patients with effusions into the pleural space were improved (table 3). In these patients there was adhesive pleuritis and obliteration of the pleural space in three instances. In the remaining patients there was no damage to the pleura except for occasional minimal scarring. A reactive exudation occasionally occurred immediately after nitrogen mustard instillation, with a rapid reaccumulation of fluid. This appeared to be a favorable prognostic sign. Eight of 11 patients with malignant ascites were improved. Although pain rarely was associated with intrapleural injection of nitrogen mustard, this was a common occurrence with the intra-abdominal administration. This was frequently associated with nausea, vomiting, and cramps. However, these untoward symptoms subsided within two or three days, and there were no complications or after-effects.

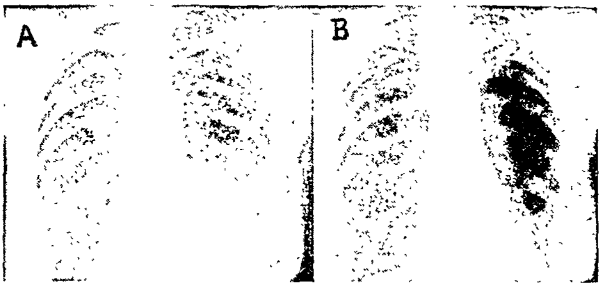

Fig. 2.—*A*, lymphosarcoma with pleural effusion. *B*, no reaccumulation of fluid 24 months after therapy with nitrogen mustard.

Both patients with pericardial effusions exhibited improvement (table 3). In these patients cardiac tamponade was completely relieved, and there has been no reaccumulation of fluid for 14 months in one patient and for 2 months in the other. Ten of the 16 patients who received no benefit from the instillation of nitrogen mustard were in the terminal phase of their illness and died within one month. There was no discernible effect on the rapidity of the course in these patients, either in increasing or decreasing the rapidity of the course.

TABLE 3.—*Summary of Results Obtained with Intracavitary Administration of Nitrogen Mustard in Malignant Effusions: Results Compared to Site of Effusion*

Site of Effusion	No.	Improvement
Pleural	30	18
Peritoneal	11	8
Pericardial	2	2

The side-effects following intracavitary injection of nitrogen mustard were usually minimal. Nausea and vomiting were less than after intravenous administration of nitrogen mustard and were usually well controlled by the use of secobarbital and chlorpromazine. The leukopenia developing after this form of therapy was generally very mild and much less than that developing with intravenous administration of nitrogen mustard. Pain rarely occurred with the intrapleural use of nitrogen

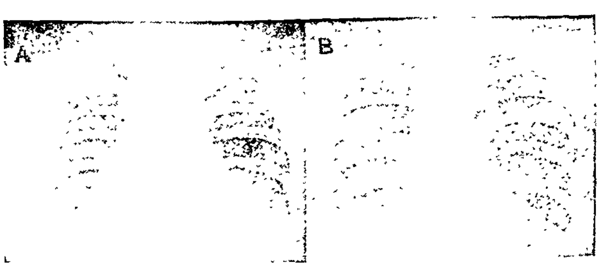

Fig. 3.—*A*, pericardial and pleural effusion due to metastatic carcinoma of the breast. *B*, after treatment with 10 mg. of nitrogen mustard intrapericardially and 0.4 mg. nitrogen mustard per kilogram of body weight injected into the left pleural space, there was complete disappearance of fluid. The patient is alive and well after 14 months.

mustard but was the rule rather than the exception with the intra-abdominal injections. The pain rapidly subsided in these patients, and there were no further complications. Cardiac irregularities were noted for a transient interval in one of the patients with pericardial effusion, but no adverse effects were observed in the other.

COMMENT

The direct instillation of nitrogen mustard into malignant effusions appears to be as effective as radioactive colloidal gold in decreasing or eliminating the formation of fluid. Thus, with radioactive gold, between 50% and 66% of patients were improved following therapy. In the present series, 65% of the patients treated were improved. In addition, the use of nitrogen mustard has several advantages over radioactive gold. It is easier and simpler to administer, no special facilities are required for its use, the drug is always available, it is less expensive to the patient, and it is not as dangerous to personnel involved. The intracavitary use of nitrogen mustard is associated with minimal and transient side-effects. It therefore appears to be the treatment of choice for the management of malignant effusions.

Long survival with relatively good health is possible following intracavitary therapy with nitrogen mustard. Its trial in all cases of malignant effusions is therefore indicated. This is especially true if the patient is otherwise in good physical condition, since most of the failures encountered in this series were in patients in a terminal state. If nitrogen mustard therapy is ineffective, subsequent treatment with radioactive gold may be beneficial. Thus, one patient not responding to nitrogen mustard subsequently responded to treatment with radioactive colloidal gold. The reverse is also true, since four patients who failed to respond to radioactive gold subsequently responded to treatment with nitrogen mustard. Thus, a total of five patients responded to combined treatment with nitrogen mustard and radioactive gold. There were no failures in any patient treated with both nitrogen mustard and radioactive gold. Such combined treatment may increase not only the percentage of favorable responses but the duration of improvement as well.

It is obvious that the direct instillation of nitrogen mustard into malignant effusions is effective against types of malignant tumors that do not usually respond to intravenous administration of this drug. It may be presumed that the effectiveness of this form of therapy is due to high local concentration of nitrogen mustard in direct contact with malignant tumor implants on serosal surfaces. The local concentration of nitrogen mustard may be of sufficient magnitude to be cancerocidal, whereas the dilution by body fluids of intravenously administered nitrogen mustards results in concentrations of nitrogen mustard too low to be effective against these tumors. Larger doses of nitrogen mustard cannot be given intravenously because of the resulting toxic side-effects and severe depression of bone marrow.

In this series, the leukopenia following therapy with nitrogen mustard was very mild and much less than that following intravenous therapy with nitrogen mustard. In addition, nausea and vomiting were also minimal and easily controlled. This suggests that larger doses of nitrogen mustard could be used without adverse side-effects. Larger doses may be more effective in increasing the percentage of favorable responses as well as increasing the duration of response.

In the choice of patients for this form of therapy, cases in which formation of fluid is due to obstructive phenomena should be excluded. If the effusion is chylous in nature or has the character of a transudate, improvement is unlikely, since large obstructing masses of tumor cannot be affected by nitrogen mustard locally. Worthwhile palliation may be obtained in these patients even without complete eradication of the tumor. Thus adhesive pleuritis with obliteration of the pleural space occurred in three patients, one of whom lived for 12 months following therapy. There was no further need for taps, and there was decreased pain, dyspnea, and discomfort.

SUMMARY AND CONCLUSIONS

The direct instillation of nitrogen mustard into malignant effusions was successful in decreasing or completely eliminating the formation of fluid in 65% of the cases treated. These results compare favorably with those obtained with radioactive colloidal gold. The use of nitrogen mustard has several advantages over radioactive gold. It is easier to administer, more universally available, and less expensive, and it presents no radiation hazard. Nitrogen mustard, therefore, appears to be the treatment of choice for malignant effusions. All patients treated with both nitrogen mustard and radioactive gold were improved. Combined therapy with both nitrogen mustard and radioactive gold may give better results than either one alone. Long periods of survival with good health may follow successful treatment of malignant effusions with nitrogen mustard. All patients with effusions due to metastatic malignancies should be given a trial of therapy with nitrogen mustard.

Industrial Health.—Do you want to have the future of medicine directed by, medical opinions rendered by, and evaluations of medical care and service made by personnel officers, safety directors, labor groups, nurses, governmental persons, and plant managers? That is just what is going on now and will be standard practice if the physicians and surgeons in every community do not go into the industrial plants, attend meetings at which relevant matters are discussed, and give constructive (not narrow protective) advice. . . . The industrial nurses recognize the need for proper medical supervision. Some elements of management recognize the need for qualified medical supervision of their occupational health programs. . . . Each one of you have a responsibility for taking another look at yourself. Each of you should look within yourself, too. Is the present motivation of some practitioners selfish, narrow, or short-sighted? Is your motivation lacking in the force that reflects the benefits to be derived from a willingness to understand, cooperate, and look ahead with the people who support you? It is past time when you can be certain of the future unless you are going to participate in your local community industrial situations, in statewide programs, and in national affairs. Things just don't happen —they are the result of someone's efforts . . . you must be ready to contribute and show that the benefits of the future are your business.—E. M. Gunn, M.D., Industrial Health Is Your Business! *Journal of the South Carolina Medical Association*, September, 1955.

METAMINE (TRIETHANOLAMINE TRINITRATE BIPHOSPHATE) IN ANGINA PECTORIS

Harvey L. Fuller, M.D.
and
Leon E. Kassel, M.D., Baltimore

Of all the drugs commonly used in the treatment of angina pectoris, glyceryl trinitrate still appears to be, by far, the most effective and most rapid in action. There is a concomitant temporary fall in blood pressure associated with its use and with it a vasodilatation of vessels, including the coronary arteries. With an increase in coronary flow, there is a resultant decrease in preexisting myocardial ischemia in those patients with angina pectoris so treated. Certain undesirable reactions ensuing from the use of glyceryl trinitrate, including diminution of blood pressure and brevity of action, have resulted in a search for nitrocompounds which are devoid of side-effects and have a significantly longer period of action. Many nitrate compounds have been studied, as borne out by the extensive literature on the subject. Shortly before World War II, Junkmann [1] discovered the vasodilating action of Metamine (the biphosphate salt of triethanolamine trinitrate), a white crystalline powder readily soluble in water, with the following chemical formula: $N(CH_2CH_2ONO_2)_3.2H_3PO_4$.

BIOLOGICAL PROPERTIES

Junkmann [1] found that Metamine has the distinct feature of having the same action as glyceryl trinitrate but is both delayed and prolonged in its effect. It, too, has the same pharmacological action as all nitrates, but animal experimentation indicates that its coronary vasodilator effect approximately parallels that of glyceryl trinitrate but is far longer lasting. He experimented on both mice and rabbits, these animals tolerating the drug in large doses. Mice tolerated the drug in doses as high as 100 mg. per kilogram of body weight and rabbits in doses as high as 200 mg. per kilogram. Spühler,[2] Poumailloux and Tetreau,[3] and Bovet and Bovet-Nitti [4] studied the drug in both animals and man, confirming Junkmann's findings as to the low toxicity and coronary dilating action of the drug. Pfeiffer [5] and Gollwitzer-Meier and Kroetz [6] investigated the coronary flow with various drugs of the nitrate series in animals. They found that the effect of Metamine parallels that of glyceryl trinitrate and found that, although the systemic blood pressure changes little with large doses of Metamine, there is a considerable increase of coronary flow by virtue of active dilatation. Pfeiffer [5] feels that Metamine has certain additional advantages not possessed by glyceryl trinitrate, such as an increased oxygen consumption of heart muscle, as well as a reduction of cardiac output and minute flow. He believes that the drug is effective in the relief of myocardial ischemia by coronary vasodilation, increased myocardial oxygen consumption, and reduced cardiac output, although the latter two have not been confirmed. He explains the stationary peripheral blood pressure on a mechanism of compensatory peripheral vasoconstriction.

The most comprehensive and recent animal study of Metamine was carried out in 1951 by Melville and Lu.[7] They initially used the isolated perfused rabbit heart and compared Metamine with glyceryl trinitrate. They reached the following conclusions: 1. Both Metamine and glyceryl trinitrate produce a prompt and immediate coronary vasodilatation, but the duration of the response in the former is longer. 2. Both drugs show approximately equal toxic reactions on the isolated rabbit heart, and there is little difference in the immediate effects of repeated injections of equal doses of the two agents. With glyceryl trinitrate, there appears to be a somewhat greater cumulative depression of both the rate and the amplitude of the contractions than is observed with Metamine. These effects might conceivably influence coronary flow, but the authors conclude that in respect to their vasodilating actions, the two agents are relatively similar. 3. Using anesthetized dogs, the authors show that when 10 times as large a dose of Metamine as glyceryl trinitrate is injected, the depressor effect on systemic blood pressure is still considerably less. In the same experiment, large doses of both drugs administered intravenously produced little change in the electrocardiographic picture. 4. In dog heart-lung preparations, measurements were made to determine effects on cardiac output and heart rate with these agents. The results were similar in each. Doses of 5 to 10 mg. of each agent produce only a brief increase in cardiac output and transient cardiac acceleration. With 2.5 to 10 times this dose, there is only a progressive decrease in output and rate with both agents. 5. The authors tested the acute toxicity of the drugs in rats and rabbits and conclude that glyceryl trinitrate is somewhat less toxic. They demonstrate that the animal recovered after 50 mg. of Metamine per kilogram was given, but a dose of 100 mg. caused a delayed mortality, and 200 mg. per kilogram caused an immediate fatality in the animal.

Associate Attending Physician (Dr. Fuller) and Chief Resident (Dr. Kassel), Medical Department, Sinai Hospital.

This study was supported in part by a grant from the Cardiovascular Research Foundation of Thos. Leeming & Co., Inc., New York.

These experiments suggested that, like glyceryl trinitrate, Metamine is rather nontoxic to laboratory animals. The authors did not study chronic toxicity of the drug. Merlen [8] studied the drug in dogs, mice, and isolated organs, and the conclusions paralleled those of Melville and Lu.[7]

It has generally been the accepted theory that the vasodilator mechanism of the organic nitrates is due to the release of nitrate ions by hydrolysis. Many investigators, including Krantz and his co-workers,[9] tend to dispute this theory and suggest that the dilator effect of nitrates does not depend exclusively on hydrolysis of nitrate into nitrite ions, and the very rapid effect produced by glyceryl trinitrate and Metamine in Melville and Lu's [7] experiments tend to confirm this. In fact, their in vitro experiments demonstrate that Metamine is much less readily hydrolyzed than glyceryl trinitrate, supporting the view that the drug's effect is as a nitrate, rather than a result of nitrate-to-nitrite conversion. Metamine, they conclude, like glyceryl trinitrate, produces direct coronary vasodilatation. They are, however, unable to explain the fact that, although equally as effective as glyceryl trinitrate as a coronary vasodilator, Metamine is far less effective as a depressor agent. They offer the theory that, since the soluble biphosphate was used in these studies, its greater solubility could be responsible for its greater vasodilator action.

CLINICAL INVESTIGATIONS OF METAMINE

Spühler,[2] Poumailloux and Tetreau,[3] Pfeiffer,[5] Merlen,[8] Bovet and Bovet-Nitti,[4] Gerstlauer,[10] Dailheu-Geoffroy,[11] and Palmer and Ramsey [12] have all studied the effectiveness of Metamine in selected cases of angina of effort and in severer forms of myocardial ischemia.

Spühler [2] used the drug in 82 patients suffering from varying degrees of coronary insufficiency. He concluded that 35% demonstrated improvement to the degree of freedom of symptoms, 40% were considerably improved, 8.5% showed slight improvement, and 16.5% showed none. He found the drug easily tolerated and side-reactions infrequent. Irritation of the oral mucosa occurred when the drug was chewed, and mild gastrointestinal disturbance was reported. Less frequently, palpitations, flushing, and vertigo were observed. One patient in the series demonstrated an urticarious skin eruption that disappeared when therapy was withdrawn; this patient also was apparently allergic to other drugs of the nitrate and nitrite series. At no time did Spühler detect signs of chronic intoxication with the development of methemoglobinemia or other blood dyscrasias.

Poumailloux and Tetreau [3] investigated Metamine clinically in patients with moderately severe and severe angina, most of whom showed changes in electrocardiographic pattern before and after exercise. They carefully avoided patients having a history of recent myocardial infarction or congestive heart failure. These workers were the first to vary the dosage from 6 mg. up to 12 mg. in divided doses in 24 hours. They also used adjunct therapy, such as sedatives, glyceryl trinitrate, and drugs of the aminophylline series. Their series was small, a total of 18 patients, and results were based on subjective improvement of patients with varying doses of the drug. For controls, they used the same patients, substituting a placebo tablet. They concluded that the drug was most effective in the milder types of angina and that its effect as a coronary vasodilator lasted several days after drug therapy was stopped. They felt that its best value lay in prevention of nocturnal attacks, and the optimum dosage they recommended was between 9 and 10 mg. in 24 hours. They saw no untoward reactions in their series and suggested that, because of this, larger doses might produce better results.

Gerstlauer [10] treated 21 patients with angina pectoris, 13 of whom were considerably benefited by Metamine; he also reported on 2 patients who failed to demonstrate typical electrocardiographic changes after the institution of Metamine therapy in exercise tolerance tests, such changes having been observed prior to the institution of therapy. Merlen [8] used Metamine therapy on eight patients with angina, all of whom presented typical electrocardiographic changes before and after exercise tests. He reported on five with considerable improvement, one with moderate improvement, one with slight improvement, and one unimproved. He also reported the delayed or latent interval from the onset of therapy and after its discontinuance. In the five patients who were markedly improved, a sharp reduction in the number of glyceryl trinitrate tablets used was observed.

Dailheu-Geoffroy [11] reviewed the literature and treated 27 patients for a period of four months. In a total of 24 patients improvement was reported; in 3 patients there was complete failure. It was suggested that the effective duration of therapy with Metamine in dosage of 2 mg. was between two and five hours and that a small concomitant dose of glyceryl trinitrate might be beneficial.

Palmer and Ramsey [12] studied five patients who were considered to have coronary arteriosclerosis, which caused five or more attacks of pain daily and was relieved by rest or glyceryl trinitrate. All patients demonstrated the typical electrocardiographic changes on exercise tolerance testing, and three gave a history of myocardial infarction in the previous three years, but not within six months. Their investigation lasted five months, and the patients themselves were used as controls with the use of placebo tablets. Subjective improvement was noted by all five patients, and each of them, while on therapy of 8 mg. daily of Metamine, demonstrated marked reduction in daily attacks. They reported a lag of at least two days after therapy had been started before improvement occurred and likewise noted a continued benefit two days after therapy was discontinued. One patient developed a coronary occlusion two weeks after drug therapy was stopped, but it was felt this had

PRESENT CLINICAL STUDY

In all, 71 patients were studied in the present series. They were obtained from private practices, homes for the aged, and outpatient clinics. Fifty-one had known histories of angina for periods varying from six months to 11 years; 20 patients had never had previous treatment for coronary artery disease. Their ages ranged from 36 to 78 years. Forty-nine were males and 22 were females. All were considered to have arteriosclerotic coronary disease. Twenty-three patients had at one time undergone exercise tolerance tests of varying types and demonstrated the characteristic electrocardiographic changes of coronary insufficiency. Nineteen had one previous attack of myocardial infarction, proved electrocardiographically, but none had a proved infarction within the previous year. Fifty per cent were actively employed in mild sedentary occupations, and the remainder were retired because of age and/or their coronary disease. Nineteen patients were diabetic and under good regulation. Thirty-three were hypertensive or gave a history of hypertension in the past. Patients with known syphilitic aortitis with anginal syndrome were eliminated from the study. Patients whose symptoms were proved or suspected to be purely psychosomatic in origin and in no way associated with coronary artery disease were also eliminated, as were those with preexisting and uncontrolled congestive heart failure.

Each patient studied underwent a complete investigation, recorded on charts prepared specifically for this study (tables 1 and 2). As well as the usual history, specific information relating to this study, with particular reference to the patient's attacks, was recorded. Fluoroscopic and x-ray examination of the heart, electrocardiograms, exercise tolerance tests, and other laboratory data were also recorded. The patient was carefully questioned regarding any previous vasodilator drugs used, including glyceryl trinitrate, their dosage, duration of use, and their effectiveness in the prevention and relief of angina.

The patient was given a daily diary sheet (fig. 1) in which he was instructed to record the following data: (*a*) total number of attacks during the day or waking hours; (*b*) total number of attacks at night or during sleep; (*c*) the nature of the average attack during the day or night; these were graduated as mild, moderate, intense, and incapacitating; (*d*) the number of glyceryl trinitrate tablets taken in 24 hours; (*e*) the duration of the average attack during the day or night; (*f*) the number of attacks felt to be severer than average and the number less severe than average; (*g*) in attacks resulting from exertion, the degree of activity required, graduated as slight, moderate, and heavy; and (*h*) the patient's general impression of each day, with reference to the attacks, comparing it with an average good or average bad day; also recorded was the effect the attacks had on his sleep at night.

At the outset, all patients were divided into three groups as follows: Group A—those on therapy with another long-acting vasodilator for at least three months. Some of these were pentaerythritol tetranitrate, mannitol hexanitrate, erythrityl (Erythrol) tetranitrate, papaverine, and khellin. Almost all of these patients took glyceryl trinitrate along with their long-acting vasodilators. This group includes the severest cases in the series. Group B—patients with milder cases, taking only glyceryl trinitrate either prophylactically or for relief of attacks and who were not taking any other nitrate or nitrite at that time or for three weeks prior to this phase. Group C—patients with mild cases, who were able to control their attacks by mere restriction of activity and who had never been on therapy with any nitrate or nitrite at any time, including glyceryl trinitrate.

Phase 1 (Pre-Metamine Phase).—In order to determine a base line in each case with regard to the number of attacks and the glyceryl trinitrate requirement, these three groups were permitted to carry on as they had in the recent past for a three week period. In each instance the diary sheet was carefully kept and evaluated at the end of the three week phase and the veracity of the diaries investigated.

Phase 2 (Placebo Phase).—In group A, these patients were placed on a three week trial with placebo. This was carried out with caution and the patients were permitted to take as many glyceryl trinitrate tablets as required. Patients severely incapacitated by this step were immediately taken off the placebo regimen and passed on into phase 3 (Metamine phase); in the entire series it was necessary only in 12 patients to follow this change of procedure. In groups B and C the patients were instructed to take the placebo in quantity comparable to what we expected to use later with Metamine. They were informed that it was a new drug whose value for the relief of their symptoms was being tested and that it was completely harmless and might be beneficial. The importance of their own suggestibility was stressed, as was its relative effect on the study. Group B patients were told to take glyceryl trinitrate freely as before. Group C patients were not given glyceryl trinitrate.

Phase 3 (Metamine Phase).—This phase, in the patients in groups B and C, was begun in the seventh week of the study and, in one-third of our patients, has continued for at least six months. The 12 group A patients whose cases were aggravated by placebo were seen at least once weekly, and the initial dose of Metamine (2 mg. four times daily) was increased until a maximum dosage of 24 mg. daily, in some cases, was achieved. The total daily dose was increased depending on severity of symptoms, number of attacks, and the degree of incapacity. The rest of the group A patients also received gradually increased doses depending on symptoms, but the change in dosage was made at three week rather than weekly intervals. This also applied to groups B and C. The majority of group C experienced no difficulty and continued on therapy of 2 mg. four times daily for varying periods.

EVALUATION

After a review of the patient's diary, the relative effectiveness of Metamine was discussed with the patient at termination of the final phase. No attempt was made to influence the patient to use a vasodilator other than the one formerly used. The final decision was made by the patient himself and his physician.

Fig. 2.—Drug and dosage chart.

Each physician was provided with a drug and dosage chart (fig. 2) in which were recorded the various phases; the vasodilator used; the dosage; an average estimate, in the physicians opinion, of the true number of attacks; and severity of attacks. The physician also recorded any side-reactions, both subjective and objective, to any of the drugs used, with particular reference to Metamine, as well as his comments on the patient's veracity and his impression of the results of Metamine therapy. The physician was asked particularly to watch for skin eruptions, severe hypotensive changes and depressor effects, changes in blood picture, and gastrointestinal side-reactions. The physician was also asked his impression of the delayed or latent period of Metamine, both at the beginning and end of its use. A final summation was presented as to the effectiveness of the drug by each physician.

TABLE 3.—*Average Number of Attacks Daily*

	No. of Cases	Phase 1 (Pre-Metamine)	Phase 2 (Placebo)	Phase 3 (Metamine)

Group C	20	8	8-16	16 (80%)	4 (20%)
	71			58 (82%)	13 (18%)

RESULTS OF THIS STUDY

In general, Metamine was quite successful in preventing attacks of angina pectoris. Tables 3 and 4 demonstrate its effectiveness clearly. Table 3 shows the daily average number of attacks for each group of patients in each phase of the study. The average number of glyceryl trinitrate tablets taken daily by the 42 patients who used this drug throughout the study was 7.0 for phase 1 (pre-Metamine), 9.8 for phase 2 (placebo), and 3.4 for phase 3 (Metamine). (Twelve patients in this group became too severely incapacitated to continue this phase longer than 7 to 10 days and they have been excluded from this average.) Table 4 demonstrates that higher daily dosages of Metamine were required to achieve the same degree of effectiveness in the severer cases. In the entire series, 82% of the 71 patients showed improvement with Metamine.

COMMENT

We are, of course, well aware of the difficulty of evaluating a vasodilator drug in the treatment of coronary artery disease because of the reliance on the method of subjective study. As Russek and co-workers[13] point out, "The inapplicability of animal observation to man, the element of subconscious bias, and the inaccuracy of clinical estimates of coronary reserve and coronary anoxia that are based on the symptom of pain . . ." make a project such as this difficult to evaluate. Russek used the exercise tolerance test as an attempt to avoid these difficulties in carefully selected cases. In the size of our series, such objective testing would be unwieldy and almost prohibitive, and therefore, as with Spühler,[2] Poumailloux and co-workers,[3] Merlen,[8] Dailheu-Geoffroy,[11] and Palmer and Ramsey[12] we were obliged to utilize, as carefully as possible, the patient's own views as evaluated by his physician.

We found that Metamine used in adequate dosage in a satisfactory number of patients effectively reduced the number of anginal attacks, tended to lessen the severity of the attacks, and sometimes prevented them entirely. Each dose, when effective, had an action which lasted from four to six hours. Metamine was not used as a substitute for glyceryl trinitrate, and the study indicated that Metamine used regularly diminished the frequency of use of glyceryl trinitrate.

F.; Doerner, A. A., and Zohman, B. L.: Choice of a Coronary Vasodilator Drug in Clinical Practice: Evaluation of Effects by Electrocardiographic Tests, ibid. **153**: 207 (Sept. 19) 1953. Russek, H. I.; Zohman, B. L., and Dorset, V. J.: Objective Evaluation of Coronary Vasodilator Drugs, Am. J. M. Sc. **229**: 46, 1955.

In regard to dosage, we found the most clinically effective dose in the moderate cases to be 4 mg. four times daily and, commensurate with the severity of the case, the larger doses, when used, demonstrated very few side-effects. In comparison to the other vasodilators, it was apparent that Metamine, milligram for milligram, is more effective in the prevention of angina. The hypotensive action of the drug, in our opinion, is slight, and patients are able to tolerate large daily doses.

CONCLUSIONS

Metamine (the biphosphate salt of triethanolamine trinitrate) is a long-acting coronary vasodilator and is effective in the prevention of anginal pain. In comparison with other vasodilators, it is more effective, milligram for milligram. Intolerance to Metamine is rare. Undesirable side-reactions, such as skin, blood, and gastrointestinal manifestations, are rare. There is a very slight hypotensive effect, which is of no significance clinically. The results obtained are sufficiently promising to warrant further clinical studies in three directions: (*a*) in the prevention and relief of attacks of acute coronary insufficiency, in either oral or parenteral form; (*b*) in the use of the drug in myocardial infarction for the purpose of offsetting reflex coronary vasoconstriction of the unaffected vessels, reducing pain and possibly reducing the extent of the infarction; and (*c*) in investigation with a sustained-release modification of Metamine, with the purpose of prolonging the effect of the drug and reducing the number of tablets that would be necessary for daily medication.

TRIGEMINAL NEURALGIA

TREATMENT BY SURGICAL DECOMPRESSION OF POSTERIOR ROOT

Robert Dean Woolsey, M.D., St. Louis

Back in 1888 Gowers[1] made some points that one should keep in mind even today when evaluating any procedure for curing trigeminal neuralgia:

> An attempt to estimate the true position of the surgical treatment of neuralgia is unfortunately beset with almost insurmountable difficulties, due to the fact that after many operations the pain has ceased, or been much lessened, for a time, but has afterward returned, and the cases have been published before sufficient time has elapsed to permit an opinion to be formed of the permanence of the effect. Moreover, the numerous cases in which there has not even been temporary relief are seldom published. In some instances, operation after operation has been submitted to by the patient under urgent compulsion of continued suffering, and the records of many cases illustrate very strikingly the need for caution in drawing any inferences from transient relief.

In 1891 Horsley,[2] performing a retrogasserian neurotomy, did an avulsion via the temporal approach, but his patient died seven hours later of shock. The search for surgical relief was continued. In 1901 Spiller and Frazier,[3] of Philadelphia, demonstrated conclusively that there would be no regeneration of the nerve fibers if the trigeminal root was cut proximal to the gasserian ganglion. Consequently, one could obtain a permanent cure. Frazier[4] further demonstrated, in 1925, that a differential section of the posterior root could be accomplished. By this procedure he was able to sever the maxillary and mandibular divisions and to preserve the ophthalmic division and the motor root. Since most neuralgias are confined to the lower two divisions of the trigeminal nerve, this method had a distinct advantage over total section of the posterior root, for it obviated the neuroparalytic keratitis that sometimes resulted after the earlier procedure.

The complications encountered after fifth nerve section have led to efforts to improve on Frazier's method. Sjöqvist[5] reported relief of trigeminal neuralgia by section of the descending tract of the trigeminal nerve in the medulla. This procedure eliminated the paresthesias that occur after nerve section, but it is an operation of considerably more magnitude than a nerve root section via the temporal route, an important consideration when one is dealing with the older patients, who most commonly develop trigeminal neuralgia. Dandy claimed certain advantages for posterior root section by the posterior fossa route. Paresthesias are uncommon when his method is used. He also claimed that the posterior fossa route had a distinct advantage over the temporal approach, since 10% of trigeminal neuralgia was associated with tumors of the cerebellopontile angle. This figure is to high, although such an association does occur. In fact, just such an occurrence led Taarnhøj[6] to an entirely new and different surgical procedure. He had found a small epidermoid tumor in the cerebellopontile angle of a 31-year-old man who was suffering from trigeminal neuralgia. He removed the tumor but was able to preserve

the fifth nerve root intact. The patient was completely relieved of pain and remained symptom-free. Taarnhøj then considered just where the fifth nerve could be compressed in the normal course from the emergence of the nerve root at the upper edge of the pons to the emergence from the base of the skull. He decided that compression could happen only at the point where the nerve enters the dural envelope, which covers a part of the posterior root and the gasserian ganglion at the apex of the petrosal bone. He then attempted to cure a patient of typical trigeminal neuralgia simply by opening the dural sheath over the posterior root and leaving the root completely decompressed. He accomplished this by an intradural temporal fossa exposure. In May, 1952, he reported on eight patients whom he had treated in this fashion. All patients had had relief of pain. The same procedure has been done extradurally by Love, Gardner, and others, with equally good immediate results.

ETIOLOGY

The etiology of trigeminal neuralgia continues to be unknown. The disease occurs most commonly in the sixth, seventh, and eighth decades of life. It is rare in persons under 30. Women have the disease slightly more frequently than men, and it is commoner on the right side than on the left. The mandibular and maxillary divisions are commonly involved; the ophthalmic division is seldom affected.

For the past half-century little thought had been directed to the cause of trigeminal neuralgia. Surgeons had been content to develop the techniques of posterior root section and had almost lost sight of the phenomenon of cause and effect. Taarnhøj [6] changed all of this. He considered that some form of nerve root compression must be operative and on that assumption obtained relief for his patients. Others have contended that the relief resulted simply from trauma in and about the region of the posterior root. Shelden [7] has been content to expose the gasserian ganglion and merely to traumatize it, not decompressing the posterior root. Schwartz [8] has opened the dural covering of the gasserian ganglion and lifted the nerve fibers out of the cavum mecklii. Most of their patients have had relief. Gardner [9] has tried to explain the mechanism of trigeminal neuralgia. As one ages, he believes, there is a relative basilar impression, or mild form of platybasia, in which the petrous tips are pushed upward. He has shown that a significantly large percentage of his patients had a higher petrous tip on the side of the neuralgia than on the opposite side, as measured by anteroposterior roentgenograms of the skull. As the petrous tip is pushed upward, the posterior root of the fifth nerve is stretched. Gardner further believes that there is a short circuiting of the nerve fibers at the point where the posterior root passes beneath the petrosphenoid fold in the dura. He postulates parasympathetic fibers in the fifth nerve and a short circuit between these and the sensory fibers. He has adduced interesting experimental work on cats to support his thesis of a short circuit. Love [10] and the Mayo Clinic group concluded that trauma is not a factor. They found no appreciable difference in the recurrence rate between the patients who had hypesthesia (i. e., evidence of operative trauma to the nerve root) and those who had no hypesthesia.

Furthermore, I have had three patients who had differential sections of their posterior roots for mandibular and maxillary division neuralgias, with relief of pain for two years in two patients and three years in the other. The pain subsequently returned in the ophthalmic division in all three. As will be indicated below, under Results, all three of these patients have obtained relief of their ophthalmic branch neuralgia by means of decompression procedure. Trauma may be a factor in relieving neuralgia, but any surgeon who has had experience with the differential section knows that the trauma involved in sectioning the lower two branches is not sufficient to insure permanent relief in the ophthalmic division.

SYMPTOMS AND SIGNS

Trigeminal neuralgia is initiated by sudden, severe, lancinating pains occurring in one or more divisions of the fifth nerve. This pain rarely, if ever, crosses the midline. When an attack of trigeminal neuralgia strikes a patient, he usually stops what he is doing. He holds the side of his face and waits for the pain to stop before continuing his activity. Often there is a trigger area at *the vermilion border of the upper lip. Pain is set off when* one touches this trigger point with hand or food. Consequently, some patients have great difficulty in eating. Some, because they cannot bear to wash the face, appear with one division of the facial area unwashed or, if they are men, unshaven. The pain usually vanishes as suddenly as it appeared. There is no hypesthesia or anesthesia. The attacks are commoner in the daytime than at night; rarely do they keep the patient awake. Between attacks, when the patient demonstrates his pain to the examiner, he usually points with one finger to the course of the pain. One should doubt the diagnosis of trigeminal neuralgia when the patient shows the course of his pain by laying his whole hand on the side of his face. Although these attacks may come at any time of the year, they seem to be commoner in the spring and fall, in times of changing weather, than at other periods.

DIFFERENTIAL DIAGNOSIS

The diagnosis and differential diagnosis of trigeminal neuralgia are made by exclusion and by history only. There are no abnormal physical findings. One should always consider the Costen [11] syndrome, and one should x-ray the mandibular joint. Usually one can make the diagnosis of Costen's syndrome by inspecting the mouth. A patient who has long been without the posterior molars, of either the upper or the lower jaw, should have his bite mechanism corrected.

The pain of temporomandibular joint disease is more *diffuse than that of trigeminal neuralgia. The joint is* tender. There is pain over the origin of the temporal

muscle. *Quite often the pain can be relieved by inserting* rubber corks between the posterior molars and having the patient bite down and close the jaws, thus pulling apart the articulating surfaces of the temporomandibular joint. Such relief is uncommon in trigeminal neuralgia. For my part, a person has trigeminal neuralgia, not temporomandibular joint syndrome, if he complains of sudden, severe, lancinating pain which he has had over a period of years and if his dentist has done considerable manipulation of the temporomandibular joint. Usually the two conditions can be definitely differentiated, and there is little point in subjecting the patient suffering from definite severe trigeminal neuralgia to further manipulations of the temporomandibular joint mechanism. It is becoming increasingly clear that the differential diagnosis of trigeminal neuralgia and the temporomandibular joint syndrome should be made more frequently. It should not be necessary to tamper with the bite mechanism of every patient with typical facial neuralgia. Naturally, a set of bite-raising appliances will bring relief for a while, but not for long. Making such appliances takes time; and, if one waits long enough, as in the medical treatment with stilbamidine or cyanocobalamin (vitamin B_{12}), the pain will temporarily subside. Surgeons are now operating on many patients on whom these bite-opening techniques were applied. Had therapy been directed at the posterior root in the first place, the patients would have been spared a great deal of time, money, and excruciating pain.

Sinus disease may cause attacks similar to those typical of trigeminal neuralgia. Roentgenograms should be taken of the sinuses of every patient suspected of having trigeminal neuralgia to rule out such conditions as acute and chronic sinusitis and carcinoma involving the mucosa of the sinuses. Tumors invading the floor of the skull from the nasopharynx may cause pain similar to that typical of trigeminal neuralgia. However, this pain is usually constant and is accompanied by paralysis of the nerve and anesthesia of the corresponding area. Tumors of the cerebellopontile angle usually have other accompanying neurological signs, such as deafness, tinnitus, and vertigo.

Migraine is usually characterized by visual symptoms and is prolonged, although limited to one side. Histaminic cephalalgia, involving the whole side of the face, occurs commonly at night. It is characterized by unilateral lacrimation and nasal discharge on the side of the pain. It is very difficult to confuse this disease with typical trigeminal neuralgia. This pain can be brought on by subcutaneous injections of histamine and is relieved by injections of epinephrine.

CONSERVATIVE THERAPY

Stilbamidine has recently been reported by Smith and Miller [12] as having a beneficial effect upon the course of trigeminal neuralgia. Nearly every patient with trigeminal neuralgia who has entered my office recently has carried a clipping from the local newspaper or a recent copy of *Time* describing the wonders of this form of therapy. On reading the article, one finds that the drug was given over a period of one week and then discontinued. The pain usually subsided about a month later. *Had sterile water been used, one could predict approximately the same results.* Trigeminal neuralgia commonly comes and goes, and *post hoc, ergo propter hoc* reasoning has led to marvelous cures being ascribed to a great many drugs.

Trichloroethylene was used by Plessner,[13] and it has given relief in certain instances. During World War I it was discovered that some persons who had been working with trichloroethylene in German aircraft factories had developed unilateral paralysis of the trigeminal nerve. Trichloroethylene was used for relieving trigeminal pain, and in a small percentage of patients did give temporary relief.

A considerable degree of success has been claimed for cyanocobalamin,[14] given by mouth or, preferably, in massive injections intramuscularly. Virtually every patient on whom I have operated has been given multiple massive injections of cyanocobalamin. Usually they have given temporary relief. I believe that cyanocobalamin will eventually go the way of typhoid vaccines, smallpox vaccines, and all the other medical treatments that thus far have been brought forth in the therapy of this disease, for trigeminal neuralgia lends itself beautifully to statistical analysis. The disease comes and goes. Therefore, whatever agent is used, if it is used long enough, the neuralgia will spontaneously disappear for a time at least. Whether the agent is cyanocobalamin or sterile water, the result will be about the same, I think, for the patient attributes his relief to whatever he has been doing or taking just before the attacks disappear.

Certain other measures have been advocated and carried out in the past for patients with trigeminal neuralgia. In some clinics alcohol injection has been used before nerve section to accustom the patient to the numbness and paresthesias that he may experience after nerve section. In my opinion, alcohol injection is a difficult procedure, which carries considerable discomfort to the patient. It should be limited to patients for whom no surgical therapy can be advised—persons so debilitated and so old that any surgical procedure is prohibited. Furthermore, certain difficulties with alcohol injection make its use prohibitive. A patient with genuine trigeminal neuralgia almost certainly will come to surgery sooner or later. *If a good result is accomplished with* alcohol injection, the fibers of the gasserian ganglion are matted together and scarred by the alcohol. Such matting and scarring make it very difficult for the surgeon to accomplish an accurate differential section or a decompression of the posterior root. Furthermore, alcohol injection rarely, if ever, cures the disease. Avulsion of the peripheral portions of the nerve at the supraorbital, infraorbital, or mental foramen has been practiced. Its most important use is in patients whose trigeminal pain originates in the ophthalmic division. Avulsion of the peripheral branch is purely a temporary measure, as the pain usually recurs within six months.

section of the trigeminal nerve, occurs about as frequently after this decompression procedure as after the old nerve-cutting procedure. So far as I know, there is no reason accounting for this paralysis. One of the three patients with peripheral paralysis of the seventh nerve responded well to cortisone. The other two responded poorly. In the patient who appeared to be benefited, the paralysis cleared completely in two weeks.

COMMENT

Taarnhøj has reported on 118 patients followed for from one to 43 months after operation. Two had no relief of pain. Further surgical intervention was necessary for relieving pain in eight patients: exeresis of the infraorbital nerve in one; posterior root section in one; a second decompression in six. One of these patients with a second decompression had further pain, and a posterior root section was necessary. Seventeen patients had some peculiar feelings, as if they were going to experience an attack, but had no further neuralgic pain. Fourteen had some uncharacteristic discomfort of the face.

In an earlier report, Taarnhøj [15] had divided persons with facial pain into three groups: those with typical trigeminal neuralgia, those with atypical trigeminal neuralgia, and those with atypical facial pain. Of 43 patients with typical trigeminal neuralgia, 4 had recurrences after decompression, 3 a few minor attacks, 3 some uncharacteristic pain, and 33 no pain. Reoperation was done in three patients—a second decompression in two, and root section in the third. Of the 27 patients with atypical trigeminal neuralgia, 15 obtained relief, and 12 had further difficulty. Two required an operative procedure. Of the six patients with atypical facial pain, three had no relief, two had recurrences, and one had relief of pain. Cleveland [16] has done the decompression procedure on 47 patients for primary trigeminal neuralgia. He has had to reoperate on five and do posterior root sections. In a series of 100 patients treated by the extradural approach described by Love,[17] 58 patients obtained relief of pain, 31 had recurrence of pain, and for 11 the results were indeterminate. Of the 31 patients with recurrence of pain, 8 have had posterior root section, 4 have had alcohol injection, and the others have carried on without further intervention. Love does not indicate the types of neuralgias treated, i. e., whether some were atypical or not. In an earlier report, Love and Svien [10] analyzed a group of 10 patients who did not get relief and stated that "most of these did not have real typical trigeminal neuralgia." This group of 10 patients occurred in a series of 39 patients. Abbott [18] has done 23 decompression procedures, with recurrences in 2 instances.

I cannot account for the fact that trigeminal pain has recurred in just one of my patients. In one detail only has my operative procedure varied from that performed by the foregoing authors: I have sectioned the dura over the gasserian ganglion as well as over the posterior root. I hardly believe that this modification could account for lack of recurrences, but it could lend credence to Shelden's [7] theory that all that is necessary for relief of trigeminal neuralgia is a certain amount of trauma to the fibers as they pass through the gasserian ganglion.

Secondly, I have tried to limit the procedure severely to patients in whom there was no question about the diagnosis. All of these patients had sudden onset of sharp, lancinating pain that radiated over one or more divisions of the fifth nerve and then ceased just as suddenly. In only one instance was there any question as to the diagnosis. This was the third patient I mentioned—the one with several complaints other than her trigeminal neuralgia.

This patient raises the subject of atypical trigeminal neuralgia. I believe that there is no such thing. Either a patient has trigeminal neuralgia, which is a definite and typical syndrome characterized by sudden onset of sharp, shooting pain that ceases suddenly, or he does not have trigeminal neuralgia. I think that this patient did not have trigeminal neuralgia. Such patients do poorly no matter what surgical procedure is used on the fifth nerve. In my experience, the patients who did poorly with nerve root sections for their supposed trigeminal neuralgia were the ones for whom the diagnosis was in doubt.

There is one danger in the decompression procedure as I now see it. Because these patients can now be operated upon with little or no neurological deficit, the procedure may be more of an invitation to operation than was the old operation of nerve root section, with its possibility of paresthesia and with its definite anesthesia in the area involved. This procedure should not be used on persons with atypical neuralgias. It should be reserved for only those persons who have definite trigeminal neuralgia until it can definitely be evaluated. Results reported by Taarnhøj and Love support this contention.

It is still too early to evaluate this procedure finally. There currently is a good deal of discussion in neurosurgical circles over whether or not the relief obtained in these patients will be permanent. It seems to me that this discussion is now entirely academic and that the procedure should be done on patients with trigeminal neuralgia. Neurosurgeons are now at the same point with this procedure that Spiller and Frazier [3] must have been about two years after their first section of the posterior root for trigeminal neuralgia. They must have had some doubts as to whether or not the cure of trigeminal neuralgia by posterior root section would be permanent. The only way to tell whether the relief will be permanent is to do the operation and then await results. Obviously, only time will tell; but, in fairness to the patient, he should be given the benefit of this procedure, which will leave him with no neurological deficit, no loss of sensation in the face, and no paresthesias, in preference to the nerve-severing operation, until the nerve-severing operation becomes necessary.

Recurrences in the ophthalmic division after differential section of the maxillary and mandibular divisions constitute a very important argument in favor of the decompression procedure of Taarnhøj. Likewise, for persons having primary neuralgia of the ophthalmic

OPERATIVE PROCEDURE

The operative procedure is done extradurally through the temporal fossa, in the same manner as the posterior root section. A decompression incision is made anterior to the ear and just above the malar arch (fig. 1). The temporal muscle is incised and separated. A perforator opening is made into the temporal bone and enlarged to a little more than the size of a quarter. The dura is then separated from the floor of the temporal fossa. The middle meningeal artery is coagulated and cut at the foramen spinosum. The mandibular division is then identified and injected with procaine containing a minute amount of epinephrine. The dura is then separated farther up over the gasserian ganglion to expose the dural covering of the posterior root, where it is reflected from the dura proper. This point occurs at the petrosphenoid ligament.

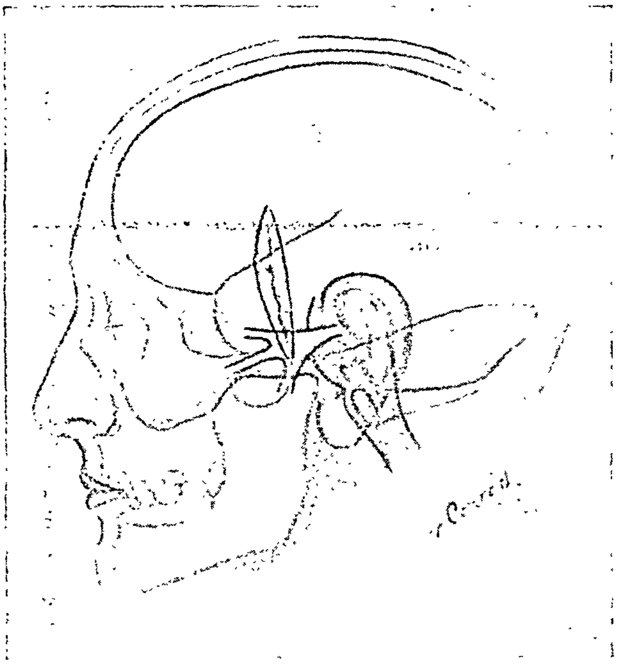

Fig. 1.—Location of incision for decompression procedure.

This procedure usually involves considerably more bleeding than did the old procedure of simply cutting the posterior root. When the posterior root is completely exposed, there is often considerable bleeding from the superior petrosal sinus and at the upper edge of the posterior root from the cavernous sinus. I have found this bleeding fairly easy to control using absorbable gelatin sponge U. S. P. (Gelfoam). When all bleeding has been controlled, an incision is made in the dura over the ganglion proper from the maxillary division back into the posterior root.

Then the petrosphenoid ligament is caught with small dural scissors and cut. The posterior root is completely decompressed, and one may look directly into the posterior fossa at the emergence of the fifth nerve from the anterior border of the pons (fig. 2). This view has the merit of enabling one to determine whether any tumor is present in the cerebellopontile angle, such as a tumor originating from the eighth nerve. After the nerve root is completely decompressed, a small piece of the gelatin sponge is placed over the decompressed area and the dura of the temporal fossa allowed to fall back in place. The wound is then closed in routine fashion.

RESULTS

I have carried out the foregoing operative procedure on 45 patients with severe trigeminal neuralgia. Subsequent results are as follows: No patient has died. Twenty-one, or about half, have had some hypesthesia on the involved side. This has lasted for three to six months. Forty-two patients have had complete and lasting relief of pain for two months to three years.

One patient showed fair results, but there has been some return of her trigeminal pain, although it has not been as severe as that before the operation. This person is not yet willing that her posterior root be cut. In one patient I was unable to separate the dura from the root and gasserian ganglion proper, and I had to cut the entire posterior root. A third patient had had a cerebrovascular accident on the side of her neuralgia. She had many complaints, such as dizziness and headache, besides her shooting neuralgic pain. Decompression of her gasserian ganglion and posterior root gave relief from her sharp, shooting pain; but, because she had no relief from her headaches and from her other difficulties, she accounted the operation a failure. Since then she has undergone a course of electric shock, and her family physician reports that she is much better. She, likewise, has normal sensation of the involved side of her face.

I have had three patients on whom differential sections had been performed previously. Results were good for two years in two of them, for three years in the other. Then their pain returned in the ophthalmic division. I sectioned the petrosphenoid ligament and dura over the posterior root. The procedure subsequently relieved their trigeminal pain while maintaining the continuity of the ophthalmic division. Pain lasted for six days after operation in one of these patients before it subsided. She has had no further episode in two years.

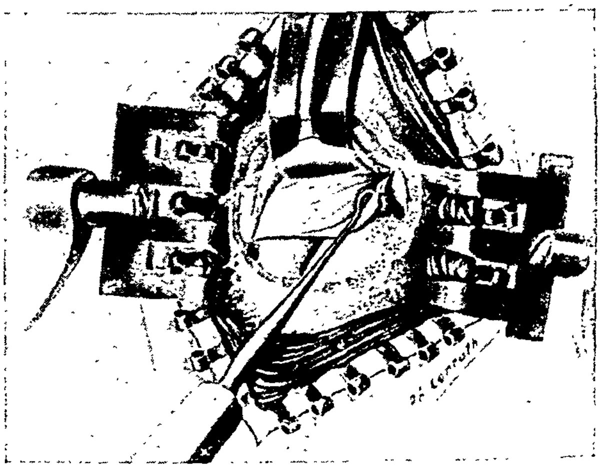

Fig. 2.—Gasserian ganglion and posterior root decompressed.

In this series of 45 patients, 3 have had temporary minor paralysis of their fourth nerve. These paralyses have cleared within six months. Temporary paralysis of the facial nerve, which has occurred in the past after the section of the trigeminal nerve, occurs about as frequently after this decompression procedure as after the old nerve-cutting procedure. So far as I know, there is no reason accounting for this paralysis. One of the three patients with peripheral paralysis of the seventh nerve responded well to cortisone. The other two responded poorly. In the patient who appeared to be benefited, the paralysis cleared completely in two weeks.

COMMENT

Taarnhøj has reported on 118 patients followed for from one to 43 months after operation. Two had no relief of pain. Further surgical intervention was necessary for relieving pain in eight patients: exeresis of the infraorbital nerve in one; posterior root section in one; a second decompression in six. One of these patients with a second decompression had further pain, and a posterior root section was necessary. Seventeen patients had some peculiar feelings, as if they were going to experience an attack, but had no further neuralgic pain. Fourteen had some uncharacteristic discomfort of the face.

In an earlier report, Taarnhøj [15] had divided persons with facial pain into three groups: those with typical trigeminal neuralgia, those with atypical trigeminal neuralgia, and those with atypical facial pain. Of 43 patients with typical trigeminal neuralgia, 4 had recurrences after decompression, 3 a few minor attacks, 3 some uncharacteristic pain, and 33 no pain. Reoperation was done in three patients—a second decompression in two, and root section in the third. Of the 27 patients with atypical trigeminal neuralgia, 15 obtained relief, and 12 had further difficulty. Two required an operative procedure. Of the six patients with atypical facial pain, three had no relief, two had recurrences, and one had relief of pain. Cleveland [16] has done the decompression procedure on 47 patients for primary trigeminal neuralgia. He has had to reoperate on five and do posterior root sections. In a series of 100 patients treated by the extradural approach described by Love,[17] 58 patients obtained relief of pain, 31 had recurrence of pain, and for 11 the results were indeterminate. Of the 31 patients with recurrence of pain, 8 have had posterior root section, 4 have had alcohol injection, and the others have carried on without further intervention. Love does not indicate the types of neuralgias treated, i. e., whether some were atypical or not. In an earlier report, Love and Svien [10] analyzed a group of 10 patients who did not get relief and stated that "most of these did not have real typical trigeminal neuralgia." This group of 10 patients occurred in a series of 39 patients. Abbott [18] has done 23 decompression procedures, with recurrences in 2 instances.

I cannot account for the fact that trigeminal pain has recurred in just one of my patients. In one detail only has my operative procedure varied from that performed by the foregoing authors: I have sectioned the dura over the gasserian ganglion as well as over the posterior root. I hardly believe that this modification could account for lack of recurrences, but it could lend credence to Shelden's [7] theory that all that is necessary for relief of trigeminal neuralgia is a certain amount of trauma to the fibers as they pass through the gasserian ganglion.

Secondly, I have tried to limit the procedure severely to patients in whom there was no question about the diagnosis. All of these patients had sudden onset of sharp, lancinating pain that radiated over one or more divisions of the fifth nerve and then ceased just as suddenly. In only one instance was there any question as to the diagnosis. This was the third patient I mentioned—the one with several complaints other than her trigeminal neuralgia.

This patient raises the subject of atypical trigeminal neuralgia. I believe that there is no such thing. Either a patient has trigeminal neuralgia, which is a definite and typical syndrome characterized by sudden onset of sharp, shooting pain that ceases suddenly, or he does not have trigeminal neuralgia. I think that this patient did not have trigeminal neuralgia. Such patients do poorly no matter what surgical procedure is used on the fifth nerve. In my experience, the patients who did poorly with nerve root sections for their supposed trigeminal neuralgia were the ones for whom the diagnosis was in doubt.

There is one danger in the decompression procedure as I now see it. Because these patients can now be operated upon with little or no neurological deficit, the procedure may be more of an invitation to operation than was the old operation of nerve root section, with its possibility of paresthesia and with its definite anesthesia in the area involved. This procedure should not be used on persons with atypical neuralgias. It should be reserved for only those persons who have definite trigeminal neuralgia until it can definitely be evaluated. Results reported by Taarnhøj and Love support this contention.

It is still too early to evaluate this procedure finally. There currently is a good deal of discussion in neurosurgical circles over whether or not the relief obtained in these patients will be permanent. It seems to me that this discussion is now entirely academic and that the procedure should be done on patients with trigeminal neuralgia. Neurosurgeons are now at the same point with this procedure that Spiller and Frazier [3] must have been about two years after their first section of the posterior root for trigeminal neuralgia. They must have had some doubts as to whether or not the cure of trigeminal neuralgia by posterior root section would be permanent. The only way to tell whether the relief will be permanent is to do the operation and then await results. Obviously, only time will tell; but, in fairness to the patient, he should be given the benefit of this procedure, which will leave him with no neurological deficit, no loss of sensation in the face, and no paresthesias, in preference to the nerve-severing operation, until the nerve-severing operation becomes necessary.

Recurrences in the ophthalmic division after differential section of the maxillary and mandibular divisions constitute a very important argument in favor of the decompression procedure of Taarnhøj. Likewise, for persons having primary neuralgia of the ophthalmic branch, the decompression procedure should certainly be the procedure of choice before nerve-cutting techniques are resorted to. None of these patients has had paresthesias of the type formerly seen with nerve-severing techniques. There have been no instances of neuroparalytic keratitis.

[18] Abbott, K. H.: Personal communication to the author.

SUMMARY AND CONCLUSIONS

The decompression procedure of Taarnhøj will relieve trigeminal neuralgia. It is too early to be able to say how many patients undergoing such decompression will have to be subjected to nerve root section for final relief of pain. Until the procedure can be finally evaluated, the decompression procedure seems preferable to nerve-severing techniques. The Taarnhøj procedure is the surgical procedure of choice in persons presenting neuralgia of the ophthalmic division, whether a recurrence following differential section or a primary neuralgia of the ophthalmic branch. Paresthesias found in nerve-severing techniques are absent in this procedure. Neuroparalytic keratitis is avoided, and this point is of particular importance in persons with primary ophthalmic branch involvement.

TEACHING LEGAL MEDICINE IN THE UNDERGRADUATE MEDICAL CURRICULUM

Samuel A. Levinson, M.D., Chicago

In the past years a great deal of emphasis has been placed on improving the existing coroner's system in this country to render better scientific investigation in deaths due to homicidal, traumatic, and unexpected natural causes. It has also been repeatedly stated that, in order to serve the community more effectively in matters pertaining to public safety and justice, the medical profession must take a more active role. This can be accomplished by the medical profession by proper technique and interpretation of medicolegal autopsy findings, including histological and bacteriological examination of the tissues, toxicologic examination of fluids and tissues, keeping adequate records admissible as evidence in the courts, assisting various branches of the law-enforcing agencies in the detection and deception of crime, and cooperating with the specialists in the fields of forensic psychiatry and immunology and the legal profession. In order to achieve these objectives, as well as to make available physicians who will have this information and experience to assist the coroner's and medical examiner's offices, we must have an educational program at the undergraduate teaching level. With a program recommended by the Committee on Medicolegal Problems of the American Medical Association to be considered in the curriculum of our medical schools, we will have a foundation for study and subsequent implementation of courses at the graduate and postgraduate levels. In this manner we, as physicians and as citizens, will render service to science, to law and justice, and to the community.

It is not my objective at this time to discuss the relative merits of the coroner's versus the medical examiner's system. The medical examiner's office in the few communities where it is now in operation is well organized, efficient in its scientific operation, and has contributed to the benefit of science, law-enforcing bodies, and the community. These offices are well staffed with competent pathologists and toxicologists and have contributed much in the field of research. Cleveland, Los Angeles, San Francisco, and New Orleans are isolated examples of places where the coroner's office has performed its function comparable to that of the medical examiner's office. There are other areas where changes in the scientific operation of the coroner's office are contemplated to meet the progress made in scientific and medical advancements. However, the majority of counties in this country operating under the existing coroner's system are inefficient. This may be partly attributed to the political aspects of this office and to the lack of informed and competent medical assistance to render effectively the service that the coroner's office requires. It makes little difference how the office is designated, but its proper functioning is dependent on competent scientific assistance. Such a program can only be achieved by the introduction into the medical curriculum of a teaching program in legal medicine.

WHAT HAS TAKEN PLACE

In European universities legal medicine has been included in the curriculum for more than a century. In the United States the first lectures on legal medicine were given by Benjamin Rush in 1811 at the University of Pennsylvania. In 1814, J. S. Stringham was the first professor of medical jurisprudence in the College of Physicians and Surgeons of New York. Since then there have been outstanding contributions by various physicians and scientists pertaining to legal medicine, and a considerable amount of research has been done by individual investigators in forensic pathology, toxicology, and immunology.

One might make an erroneous conclusion from this observation that we in the United States have made strides in teaching legal medicine to our medical students, thus preparing our doctors to be of service to the community in the application of law and justice. In fact we in this country have been derelict in the teaching of legal medicine in our medical schools in comparison to the European universities. Kozelka[1] says, "While the

Chairman's address, read before the Section on Pathology and Physiology at the 104th Annual Meeting of the American Medical Association, Atlantic City, June 8, 1955.

[1] Kozelka, F. L.: Legal Medicine in the United States, Ciba Symposia 21: 1305 (Winter) 1950.

technological aspects of legal medicine have made phenomenal strides, the teaching of legal medicine in our universities and the implementation of this knowledge by adequate legal procedure has lagged lamentably. The early established medical institutions accepted the dictum that the function of medicine is not limited to the knowledge and cure of disease but comprises also the very important mission to protect life and property and to detect fraud and guilt. The teaching of legal medicine is generally limited to a one or two credit optional course and as a result the practicing physician is not prepared to perform one of his important functions in the community."

The physician engaged in general practice or one who specializes in a specific branch of medicine is called upon to render service in matters pertaining to public safety. The increasing complexity of civilization, the problems presented by congested urban areas, and our age of technocracy present an opportunity and a challenge for the integration of the medical sciences and law. In the administration of justice and in the enforcement of the law of the land, particularly as it applies to the forensic sciences, the physician must assume his responsibility as a citizen and as a responsible person who may be required to furnish medical evidence. Forensic medicine, or legal medicine, is that portion of medical knowledge that may be of assistance in serving the needs of law and justice. It is often thought of as concerning the medical aspects of criminal offenses, but it is also called on to render assistance in the adjudication of cases involving life and accident insurance, industrial compensation, soldiers' rehabilitation, and other civil court actions. Since medical evidence is very vital in the administration of justice, Moritz[2] has indicated very definitely that "Only a physician can supply the critical evidence required if justice is to be based on truth." This educational program should not begin at the graduate or postgraduate level but should be instituted in the undergraduate training curriculum.

REASONS FOR TEACHING LEGAL MEDICINE

In 1931 Dr. C. W. Muehlberger and I[3] inaugurated a 16 hour program in legal medicine at the University of Illinois College of Medicine. The subject material and demonstrations were in many regards similar to those reported in the recent survey of the Committee on Medicolegal Problems of the American Medical Association.[4] This survey reported that only 16 schools in this country offered adequate instruction in legal medicine. Our course was given to the senior medical students, and, since it was an elective course, it was limited to twenty-five students. Experts in forensic pathology, toxicology, immunology, psychiatry, law, and police sciences participated in this program. Other medical and law schools in our area adopted a similar program. Unfortunately, in recent years the subject of legal medicine has been discontinued from the curriculum in our medical schools in Chicago. Only 12 medical schools (Harvard, Tufts, Boston, Maryland, Virginia, Yale, Vermont, College of Medical Evangelists, University of Southern California, University of California in Los Angeles, University of California in Berkeley, and the University of Rochester) have required courses in legal medicine in the United States. Every medical student and physician should receive information in (*a*) what constitutes a coroner's or medical examiner's case and the manner for investigating the cause of death; (*b*) forensic pathology and the study of unexpected death and the problems encountered in the similarity and differentiation of traumatic and homicidal deaths; (*c*) forensic toxicology and the pathological changes that may result; (*d*) forensic immunology and the application of blood groups and serology in the detection of crime; (*e*) the application of forensic psychiatry in medical and legal practices; (*f*) demonstrations by law-enforcing bodies in the techniques used in crime detection and deception; (*g*) the importance of medical records in courts; and (*h*) the doctor as a medical expert witness.

All of these are basic materials of general interest and importance to every physician. Let us not overlook the fact that every patient under study by a physician in his office or hospital may be a potential medicolegal problem. Any accident, industrial or otherwise, or inhalation of noxious agents, may result in immediate or delayed injury resulting in inability to continue to work, or death. The physician in attendance in this instance can supply valuable information in the interest of public safety and justice. Any and all cases of accident, homicide, suicide, or attempted suicide first seen by the physician require not only knowledge in medical management but also his interpretation of the findings and his assistance in the administration of justice.

There are many examples one can cite to illustrate further the reasons why the medical student and physician should have this type of knowledge. Sudden and unexpected deaths present a challenge to every physician. What are the underlying anatomic changes that bring this about? Anesthetics and mismatched blood given in transfusions cause reactions; a patient in the hospital who is permitted to go to the bathroom suddenly collapses and dies; infants and children are found dead in their cribs; someone who receives a superficial bruise or who has eaten food that he claims gave him heart burn dies suddenly. The lay person is unable to comprehend these unexpected and sudden changes that affect members of their families, and quite often the physician is bewildered and can offer no explanation. I recall an episode where a patient was hospitalized because of anginal pains. According to the attending physician, the patient was progressing well, and he assured the patient and the family that within a few days the patient could go home. Then one day the patient experienced sharp substernal pain, developed a shock syndrome, and within 15 minutes died. The attending physician was in a predicament to explain to the family the sudden and unexpected death of the patient. The doctor did not know what had taken place; he was accused of negligence in the management of the patient and was threatened with a court suit for malpractice. Fortunately, an autopsy was permitted, and it revealed a spontaneous rupture of the heart and hemopericardium. The attending physician now had the information, from the autopsy findings, to interpret to the patient's relatives the cause for the sudden and unexpected death. Also these findings prevented the alleged malpractice suit.

INSTITUTES OF LEGAL MEDICINE

A great deal of emphasis has been given to efforts to improve the existing coroner's and medical examiner's offices. There is a need for trained forensic pathologists and toxicologists. Since many of the states do not have available pathologists, especially those trained in forensic pathology, the coroner's and medical examiner's offices must rely on practicing physicians to assist them in investigating deaths and, when indicated, in performing autopsies. In the interest of public welfare and health and criminal justice, the general pathologist and particularly the general practitioner who accepts such functions must appreciate what his responsibilities are in medicolegal problems. Where can such a training program be obtained? Where can one receive graduate and postgraduate work in this field? What areas and institutions are available where one may go for study and research, particularly if one desires to become a specialist in legal medicine?

In the United States there are no institutes of legal medicine comparable to existing institutes on the continent. There are isolated areas in large cities where the medical examiner's and coroner's office, in affiliation with medical schools, can offer a training program to physicians in advanced forensic pathology and toxicology. These are excellent training centers and are responsible for many of the highly trained specialists in these fields who have obtained positions in other localities. If we had institutes of legal medicine in areas where there are medical centers, we could coordinate and integrate the facilities available as well as the services of teachers and experts in the various branches of the forensic sciences, and we would have at all times an active teaching program in legal medicine. Institutes of legal medicine would be the center where physicians and lawyers could go for refresher courses and advanced study. Such institutes would become centers not only for the careful prosecution of necessary public work but also for the postgraduate training program of medical examiners and coroners' physicians and for the furtherance of medicolegal research.

Institutes of legal medicine would also be the centers of greatest service to their communities. In this country where we have made tremendous strides in industrial developments, we have stressed safety measures to the employees, but how much more effective this would be if industrial plants would utilize the institutes of legal medicine for study and demonstrations. In the Medicolegal Institute in Vienna there were demonstrations and exhibits illustrating the various aspects of electropathology, pneumonoconiosis, the effects of noxious agents, inhalation of dust and fumes, carbon monoxide intoxication and poisoning, alcoholism, lead poisoning, and the pathology of sudden, unexpected, and traumatic deaths. Housewives were invited to visit the institute to witness demonstrations of various electrical household equipment illustrating the dangers of faulty household gadgets and how to recognize them and thereby avoid accidents. There were also exhibits of medicine cabinets containing drugs showing accessibility of these to children, the effect drugs may have when ingested, how to prevent these occurrences, and what first-aid measures to give. One can visualize readily the effectiveness of such a program in the community, the benefits derived by industry, and the contribution to public health and safety.

In a few areas the medical examiner's and coroner's office have inaugurated on a limited scale some of the contributions offered by the continental institutes of legal medicine. The first chair of legal medicine in this country was at Harvard University. Innumerable contributions to legal medicine have come from the medical examiner's office. The investigations of T. Leary on coronary arteries and unexpected deaths due to heart disease have shed invaluable light on the physiology and pathogenesis of this condition. Our knowledge of radium necrosis of bone has been advanced by the researches of H. Martland. Others, independently interested in forensic science, have contributed important data to this field. The research of Ludvig Hektoen in immunology and K. Landsteiner in forensic immunology and blood grouping are classic contributions. The studies by LeCount, Moritz, and associates on the physiology and pathology of the effect of physical agents and trauma to the body and reports by others working in the fields of forensic pathology, toxicology, and psychiatry have been of immeasurable value.

It is clear that the establishment of institutes of legal medicine in association with medical teaching centers, and in urban areas with teaching hospitals, under the direction of competent, trained personnel would be an outstanding contribution to society. The result would be a more thorough and intelligent investigation of crimes and deaths due to violence and other undue means. It would mean better safeguarding of the rights of the accused individual. From the educational standpoint, such institutes would become centers for the training of physicians and for postgraduate study for specialists in legal medicine where lawyers and ancillary groups in crime detection and deception would assist one another in the prosecution of public safety and criminal justice

MEDICINE AND LAW

The Bible relates an interesting story about two brothers, Cain and Abel. It appears that Cain for various reasons decided to kill his brother Abel. He planned the killing of his brother so that it would appear as an accident. He succeeded in his plans but was apprehended and punished. Here is an example of murder that was the culmination of envy, jealousy, and revenge, an interlocking of psychoanalytic intrigues with a personal justification for the destruction of a man. There are numerous examples of homicide, justifiable or otherwise, in pre-Biblical and post-Biblical times. But it required one of the commandments, "Thou shalt not kill," to direct attention to the injustice of homicide in order to stabilize man in his communal environment and to make justice prevail. In the centuries that followed the legalistic thinking of reason against passion in the various patterns of our socioeconomic existence, the formula of reason invariably followed passion. If justice or righteousness is the ultimate end of law, a concept that was recorded in the book of Leviticus and was developed by Greek writings and influence, it reached its zenith when Thomas Aquinas considered it a basic principle in theology. It permeated the philosophical systems of "natural law" and was independent of time and place; it was always the same everywhere. This concept provoked a feeling of passive admission adhering to an admissible standard of natural laws. But to appreciate the significance of justice there must be aroused in people the sense of injustice, a positive and active realization of a condition and not a fanciful hypothesis. Many examples can be cited to illustrate this idea, but the commandment "Thou shalt not kill" not only indicated the processes of justice in the event of homicide or murder but the tribulations of injustice. Professor Cahn [5] summarizes this succinctly: "Justice means the *active processes* of remedying or preventing what would arouse the sense of injustice."

We, as citizens and as physicians, owe to society an acceptance of this concept. In the complex and turbulent society we live in, and the whirlpool of our age of technocracy and our socioeconomic structure, various injuries affecting the mind and body may result. If experience means anything, we must take cognizance of experience when we are told that each year in the United States there occur approximately 100,000 deaths due to violence of one kind or another and an equal or greater number of deaths take place unexpectedly from obscure causes and are, therefore, potential cases of death by violence. Approximately 200,000 unexplained or violent deaths each year are due to accidents, suicides, and homicides. Moritz [2] interprets these reports by insisting that "society depends upon the physician of the country to acquire and interpret the medical evidence needed to separate the violent from the non-violent deaths in this group, to aid in distinguishing between homicide, suicide and misadventure, and to recognize previously unsuspected but potentially preventable hazards to public health. If these and other medicolegal responsibilities of the medical profession are ignored during undergraduate medical education, the young physician is encouraged to believe that such responsibilities are unimportant and he has no obligation to discharge them."

In a discussion on "The Sanctity of Law: A Critique," Professor Cohen [6] says, "If we wish to deal with the economic problem realistically, we must get rid of fixed *a priori* views. These views come down from a relatively stable society. In such a society certain customs become established and hallowed by use and wont. But they are no longer applicable to a heterogeneous and rapidly changing order. We cannot live by established custom when things are changing or when the ideas of justice of one group conflict with the ideas of justice of another group. We need a better technique for finding ways of adjustment."

If we are to give assistance in matters pertaining to public safety and criminal justice, our obligations to our patients and society can only be fulfilled through the medium of education, by teaching legal medicine to our undergraduate students and to physicians at the graduate and postgraduate levels. Society will be the beneficiary, for we will have contributed the tools necessary to aid the law of the land. Justice will have the honest support of physicians and scientists in the active processes of remedying or preventing what would arouse the sense of injustice.

EXTRAOLFACTORY COMPONENTS OF FLAVOR

Edward C. Clark, M.D.
and
Henry W. Dodge Jr., M.D., Rochester, Minn.

Originally stimulated by interviewing an anosmic patient who stated she could still perceive flavors, we turned to the literature on the subject of flavor and found that uncertainty continues to exist as to the importance of olfactory and extraolfactory sensations in this regard. Because of the availability of five patients whose olfactory nerves had been surgically proved to be destroyed, either by basofrontal brain tumors or by cranial trauma, the opportunity presented itself for more definitive study.

METHOD

The five patients (one the subject of a published case report [1]) mentioned in the preceding paragraph were studied, together with a group of 10 normal controls. The patients without the sense of smell were of both sexes and of varying ages and occupations and had been anosmic for varying periods. The controls fell into similar categories. Smokers and nonsmokers were present in both groups. One control had complete dentures. All subjects were free of nasopharyngeal and sinus disease. In each instance the sense of taste and the somatic sensibilities of the mouth were intact. All of the controls gave normal olfactory responses as well. The anosmics, of course, could not perceive odors. Because we could not find a test of flavor directly applicable to the situation, we devised our own. The details of this test are reported elsewhere.[2] Briefly, however, it consisted of 31

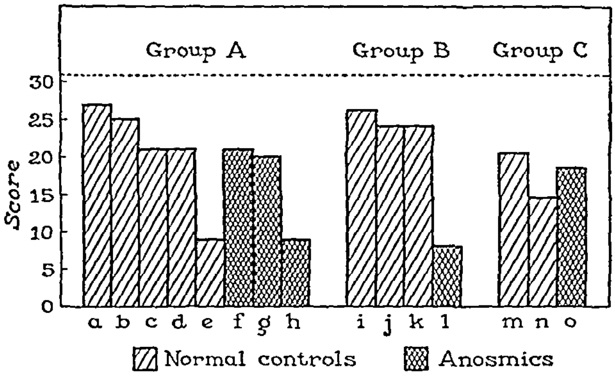
items. These were vegetables and fruits given to the subjects in different consistencies at room temperature. The test for each subject was similar in detail in every instance and was given in two separate parts on successive days or weeks so as to prevent fatigue. All solid foods were cubed so as to prevent easy identification of the substance by its shape. The subjects were blindfolded during the procedure. Their mouths were rinsed with water, and several minutes were allowed to elapse between the giving of one test food and the next. As each food was given, the subject was requested to identify it. If he could do this he was asked whether he could perceive the flavor.

RESULTS

Normal Controls.—Analysis of the responses to testing of the normal controls revealed considerable variation in the accuracy of their answers. Although women tended to do better than men, experience with cooking was not a prerequisite for superior performance. As might have been expected, these subjects did best when presented with standard dietary items in their common vehicles and in their usual consistency. The one normal control with complete dentures did poorly with the test foods (see figure, column e). Possibly his dentures affected his perception of flavor. Some of the normal controls tended to pay more attention to oral sensations than did others. It must be reiterated that all of these patients were blindfolded and were deprived, therefore, of visual recognition of the food.



Comparison of the flavor-test scores of 5 anosmic patients and 10 normal controls. Thirty-one items were used in the test; a perfect score, therefore, would have been 31. Group A includes seven housewives, three of whom were anosmic and four, normal. All had had considerable experience in cooking. The fifth control (column e) was a middle-aged man with no particular culinary experience. Group B includes four young business women who cooked occasionally. One was anosmic, and three were normal. Group C includes three men, aged 20 to 24 years. One was anosmic, and two were normal. None had experience in cooking.

Anosmic Patients.—The scores made by anosmic patients also varied considerably. While two of the anosmic housewives (columns f and g) received the highest scores of the group, experience in cooking was not necessarily related to the best performance. As might have been expected, the more expert anosmic women did better than the one young man (column o) who had lost his sense of smell. As with the normal controls, anosmic patients were more accurate when presented with foods commonly eaten in their standard vehicle and in their usual consistency than when foods were in anywise unfamiliar. Of the anosmic patients who could recall having been able to detect odors, one (column h) believed that she had been largely deprived of her ability to discern flavors. Another woman who had lost her sense of smell at the time of operation (column g) stated that she had noticed no difference in the flavor of foods before and after complete destruction of her olfactory nerves. Two other such patients (columns f and o) observed that they had lost their ability to discern a few relatively unimportant flavors along with their loss of the sense of smell. One anosmic bookkeeper (column l) could not recall ever having recognized odors. When questioned she stated that she could perceive flavors well; nevertheless, when tested she did poorly. However, she often mentioned the color and appearance of the food that she thought she had been given in the test, and she seemed to be hampered more by the blindfolding than were some of the other anosmic as well as the normal patients.

Comparison of Normal Controls and Anosmic Patients.—To clarify relative abilities we assembled the normal controls and the anosmic patients in three separate groups, as is shown in the figure. The composition of these groups is given in the accompanying legend. No anosmic patient did as well as the best normal controls in identifying test foods; however, some of the subjects without the sense of smell did as well as some of the normal controls and better than the poorest control (column e). As was expected, some of the anosmic patients did very poorly (columns h and l).

On most occasions, when the test food was correctly identified either by an anosmic or by a normal control, the subject declared that he could perceive the flavor. In a few instances, however, members of both groups identified a food by physical characteristics but stated that they could not perceive the flavor. Conversely, on occasion members of both groups would misidentify some food and state that they could discern the flavor. For example, one normal person identified a pear as a peach and stated that she could perceive the flavor of peach.

COMMENT

Contrary to what might have been expected from a review of the literature,[3] the ability of certain of the totally anosmic patients to perceive flavor was not seriously impaired by their loss of the sense of smell. The fact that these subjects were able to score as well as, or better than, some normal controls in the tests of flavor suggests that olfaction had not been of paramount importance in their ability to discern the flavor of foods prior to their losing the sense of smell. This does not imply, however, that olfaction is always of secondary importance in the perception of flavor. As was demonstrated by the low test scores of the remaining anosmic patients, loss of olfaction (and perhaps of vision) appears to have been of primary importance in their failure to perceive most flavors. In view of this, it seems that flavor must be a composite of many sensations. Consequently, separating flavor into its various components is difficult. In fact, with the data at hand, we can only speculate as to the make-up of this sensory complex.

The many odors that man can distinguish undoubtedly add materially to the enjoyment of foods. The ability to perceive sweet, salty, sour, and bitter sensations in the mouth is one of the most fundamental building blocks of this sensory composite. The widespread location of the taste buds on the tongue, palate, and nasopharynx gives man a maximal opportunity to sample each morsel of food before swallowing it. However, the act of perceiving flavors is not a simple mental combination of odor and taste. All of the somatic sensations experienced in the mouth, nasopharynx, and adjacent structures are important. For example, the temperature end-organs in the buccal cavity are our main source of information concerning the hotness or coldness of a substance at the time of eating. Most Western peoples are accustomed to a hot cup of coffee, and this coffee at room temperature is less palatable, both because of its temperature and because of its lack of aroma.

Pain is another important oral sensation associated with flavor. It prevents admission of noxious substances to the alimentary tract and, paradoxically, adds to the enjoyment of food; for example, no connoisseur of Mexican food would be entirely satisfied with a "bland" hot tamale. The wetness or dryness of foods can alter the flavor considerably, both from the standpoint of the sensation produced in the mouth and from that of the chemical changes within the food produced by hydration or dehydration. Likewise, chemical changes produced in the food by saliva may play an important part in certain instances.

The end-organs of light touch and deep pressure are utilized by the mouth, alone, together, or in combination with other sensation. Although difficult to analyze, sensibilities that play important parts in the contribution of oral sensations to flavor are vibration and other sensibilities mediated by way of the teeth and bones of the jaws, proprioceptive impulses from the muscles of mastication and expression, two-point discrimination, and stereognosis. Such terms as texture and consistency represent qualities of foods that elicit composites of many of these oral sensations. A food that exemplifies both of these qualities, as pointed out by Crocker,[3b] is taffy. This "chewy" candy is pulled by machines (or by hand) to develop brittleness and fibrous texture, which stimulate more desirable sensations and improve flavor.

One cannot, however, limit flavor to olfaction, taste, and the somesthetic sensations of the oral cavity. Vision, hearing, and the psychological state of the person at the time of eating the food also are important. Vision, for example, plays a prominent part, though one difficult to evaluate, in the perception of flavor. The tests used in this study, on both the anosmic and the control groups, necessarily excluded vision. Hearing enters into the perception of flavor in many ways. Modern advertisers recognize this in their use of such terms as crunchy and crackling, words with strong auditory components. The psychological state of the person at the time of eating may affect his perception of flavor. This psychological component has many facets. Among these, at least in part, are those just mentioned: vision and hearing. Also involved are the memories of previous experiences with the flavor, the interest the person has in food, and the setting in which the food is being eaten.

Thus, extraolfactory sensations often play major roles in the perception of flavor. However, as already has been mentioned, this does not necessarily imply that olfaction is not, at times, of primary importance in this regard. Rather, it suggests that olfaction may be one of the basic elements used in the final cerebral synthesis of flavor and that individuals may vary in their dependence on one sensation (smell, temperature, and taste for sweet, salt, or sour flavors, and so on) or another, in accordance with the sensory patterns learned previously.

One might well apply Mackay's simile [4] of the piano keyboard to these basic head sensations. Each normal individual has the full sensory keyboard at his disposal during maturation. As each person develops his sensory patterns, he may learn to use one or another, or a combination, of the various head sensations as the fundamental tone and to employ the remaining sensory modalities as the harmonics of the sensory chord. Should the fundamental tone be lacking and only the harmonics remain, the chord may become a meaningless grouping of tones and the perception of flavor may be lost. Thus the olfactory and extraolfactory sensations appear to play roles of varying importance in the discernment of flavor. One or the other is the fundamental tone, and the remaining sensations serve secondarily as the harmonics. In addition, the possibility that some undiscovered receptive mechanism in the mouth and nasopharynx may enter into the perception of flavor cannot be excluded.

This concept that flavor is a synthesis of many different sensations, in which olfaction plays a role of varying importance, raises certain semantic questions. As the word "flavor," thought to be derived from the old French term *flaur, fleiur,* meaning smell, is defined in the Oxford Dictionary as "the element in the taste of a substance which depends on the co-operation of the sense of smell," this term no longer seems adequate. The less commonly used word "savor," derived from the old French *savur, savour,* meaning "taste," seems more appropriate, and we suggest its use in this sense.

SUMMARY

When proved anosmic and normal control patients were studied to determine their ability to perceive flavors, it was found, contrary to popular belief, that several of the anosmic subjects were able to discern flavor. As olfaction was excluded in these cases, it is apparent that the extraolfactory components must at times play the major roles in identification of the flavor of substances. These extraolfactory components are the somatic sensations experienced in the mouth, nasopharynx, and adjacent structures, as well as vision, hearing, memory, and the psychological state at the moment of eating. Speculation is warranted on the mechanism of the interplay between the olfactory and extraolfactory sensations in the final sensory synthesis of flavor and on the possibility that some undiscovered receptive mechanism in the mouth and nasopharynx may enter into perception of flavor. Finally, it is felt that the word "savor" is much less attended by the connotation "smell" than is the word "flavor," and would seem to be a more appropriate term in this regard.

INTRA-ARTICULAR AND PARAVERTEBRAL INJECTION OF CORTISONE IN OSTEOARTHRITIS OF SPINE

Abraham Cohen, M.D., George E. Scott, M.D., Richard F. Turner, M.D.
and
Isadore Rose, M.D., Philadelphia

Osteoarthritis of the spine is a common ailment. While the disease is of metabolic origin, certain occupations predispose to its development. For clarity, osteoarthritis is best described in three divisions, that is, as it affects the (1) cervical vertebrae, (2) thoracic vertebrae, and (3) the lumbar vertebrae and sacroiliac and lumbosacral joints. More than one of these locations is likely to be involved.

Osteoarthritis of the cervical vertebrae is prevalent among individuals whose occupations necessitate that the head be held in one position for long periods. The telephone operator, the traffic officer, and the physician or attorney who reads a great deal are probable subjects. Early in the disease there may be only a cracking sensation in the neck. Pain may not occur at this stage, but, when it does, it is referred to the side of the neck and radiates to the shoulder and frequently down the arm. It varies in intensity from a dull ache to a lancinating pain. Sometimes pain occurs bilaterally.

The radiographic examination shows normal curvature, but exostoses are present. The lateral view readily demonstrates that they extend into the soft tissues anteriorly from the bodies of the vertebrae at the junction of the cartilage of the intervertebral disk. The anteroposterior view shows spurring in the intra-articular facets. These findings, however, are not a criterion of the actual pathological process involved, because a large area of inflammation must be present for some time before the reaction to it can result in formation of new bone.

Osteoarthritis of the thoracic vertebrae is prone to occur among individuals who pursue laborious occupations. The housewife who raises a large family and whose duties necessitate the scrubbing of floors, the weekly washing of clothes, and numerous menial household chores; the stevedore; the grocery clerk who lifts heavy loads; and the obese individual present this picture. It is a disease of the middle-aged and elderly. The usual complaint is of pain over the precordium or in the upper or middle back. Deep breathing, coughing, sneezing, bending, or exercising will precipitate pain. Tenderness over the spine is apparent upon thumping above the involved areas. This is the time-honored intercostal neuralgia. Osteoarthritis of the thoracic vertebrae is readily recognized upon radiographic examination.

The pathological changes are usually confined to the intervertebral disk and the bodies of the vertebrae. Because of continued stress at the anterior, anterolateral, and lateral margins of the cartilage and bone, a low-grade inflammation commences. As the cartilage is avascular and bone is well supplied with blood, the metabolic process results in a paucity of cartilagenous cells and an osseous outgrowth (lipping). Usually spicules of bone form on the proximal and distal margins of the bodies of the vertebrae. Eventually the spicules meet, and because of contiguity ankylosis results. Here, too, it must be borne in mind that, while radiographic examination may reveal extensive osteoarthritis, a larger area than that exposed must have been involved for the extensive inflammation reaction to have occurred. The low-grade inflammatory also affects soft tissues, so that intercostal nerves are involved in the process as well as cartilage and bone.

Osteoarthritis of the lumbar spine, lumbosacral joint, and sacroiliac joints is the most common type. Except for the knee joints, osteoarthritis most frequently involves the lower spine. Excessive weight, faulty posture, and undue effort all affect these joints. Pathologically the process resembles that of osteoarthritis in other sections of the spine.

TREATMENT

Because of the severe pain associated with osteoarthritis of the spine and because there is so little in the therapeutic armamentarium for the relief of this condition, we undertook to study its treatment with intra-articular and paravertebral injections of cortisone. Our results have led to the suggestion of a method for obtaining symptomatic relief that can supplement older proved methods of treatment. There is no intent to detract from the time-honored means for the relief of stress and strain in osteoarthritis of the spine.

Both cortisone and hydrocortisone have been injected intra-articularly in rheumatoid arthritis and osteoarthritis.[1] While not uniformly effective, cortisone has in general produced the same effects as hydrocortisone but to a lesser degree and for a shorter length of time. In rheumatoid arthritis, there has been diminution in inflammation, pain, swelling, and stiffness, and diminution or disappearance of effusion. A decrease in the total white blood cell count in the joint fluid and improvement in the quality of mucin and in viscosity of synovial fluid have occurred as well as a reduction in the intra-articular temperature. Improvement in the range of motion in patients with osteoarthritis has been reported.[1c]

From the Department of Medicine, Jefferson Medical College, and the Arthritis Clinic of the Philadelphia General Hospital.

Cortisone was furnished as Cortogen acetate injection for this study by Dr. George Babcock, Clinical Research Division, Schering Corporation, Bloomfield, N. J.

Y.: Hydrocortisone and Cortisone Injected into Arthritic Joints: Comparative Effects of and Use of Hydrocortisone as a Local Antiarthritic Agent, J. A. M. A. **147**:1629 (Dec. 22) 1951. (*c*) Bilka, P. J.: Intra-Articular Use of Hydrocortisone in Rheumatic Diseases, Minnesota Med. **35**:938, 1952. (*d*) Ziff, M.; Scull, E., and Bunim, J. J.: Effects of Intra-Articular Cortisone and Hydrocortisone in Rheumatoid Arthritis, Fed. Proc. **11**:405, 1952. (*e*) Kersley, G. D.: Intra-Articular Use of Steroids in Arthritis, read before the 8th International Congress of Rheumatic Diseases, Geneva, Switzerland, August, 1953.

In rheumatoid arthritis, the injection of hydrocortisone has resulted in marked prompt local alleviation of symptoms and signs: decreased joint swelling and pain, improved motion, and reduced joint temperature.[2] It has produced prompt and better-sustained decrease in cell count of synovial fluid and a greater and more sustained increase in viscosity as compared with cortisone. In osteoarthritis,[3] the injection of hydrocortisone into the affected joints has promptly relieved signs and symptoms. Greater relief has been obtained and for longer periods than in rheumatoid arthritis. The beneficial effects seem to indicate that hydrocortisone has anti-inflammatory as well as antirheumatic action. Relief has lasted from a few days to several weeks. Successive injections have been as effective as the first.

Many joints have been injected with cortisone or hydrocortisone, primarily the knee, the hip, the elbow, the wrist, and the ankle. Since there has been a warning against intervertebral injection, few reports on intra-articular injection in the spine have appeared, but the procedure has been accomplished successfully.[4] The procedure we have developed in extending our experience [4a] on injection into and around the spine varies with the section of the spinal column under treatment. Thus a paravertebral injection is made around the cervical vertebrae while an intra-articular injection is made in the sacroiliac joints.

PARAVERTEBRAL INJECTION OF CERVICAL VERTEBRAE

Paravertebral injection of cervical vertebrae is relatively simple. First, consideration must be given to the sensory distribution from the cervical and the brachial plexus. When occipital headache due to cervical arthritis is present, involvement of one or more of the three upper cervical vertebrae is likely. If pain radiates from the neck to the shoulder or down one or both arms, then the brachial plexus is concerned and cervical vertebrae below the third will be involved. The usual site lies between the fourth and the sixth cervical vertebrae.

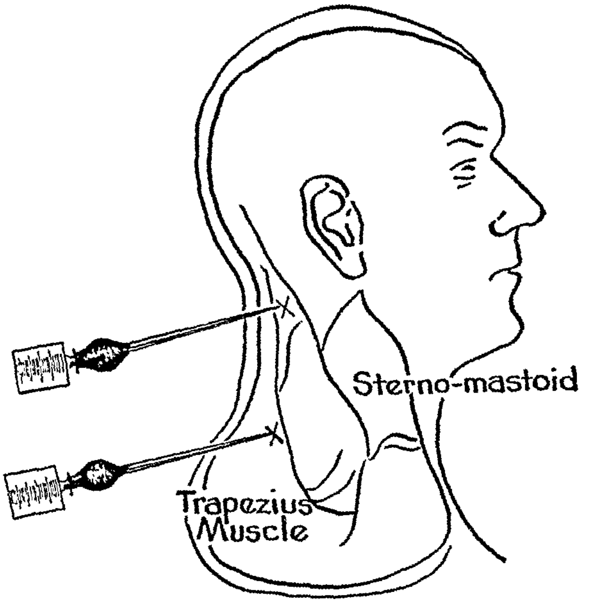

Fig. 1.—External site of paravertebral injection.

The technique of paravertebral injection is as follows. The skin is sterilized in the usual manner. If desired, 1% procaine hydrochloride may be used for local anesthesia, but we prefer to inject cortisone or hydrocortisone without the aid of a local anesthetic in order to avoid confusion in the interpretation of results. Irritation to either drug is sometimes encountered. To insure against this, an equal volume of 1% procaine hydrochloride may be injected simultaneously in the same syringe. One cubic centimeter (25 mg.) of cortisone or hydrocortisone in aqueous suspension is drawn into a syringe fitted with a long, 21-gauge needle. The needle is inserted laterally at the level of the involved area. It is then advanced medially and anteriorly at a 45 degree angle until the transverse process is encountered (fig. 1 and 2)

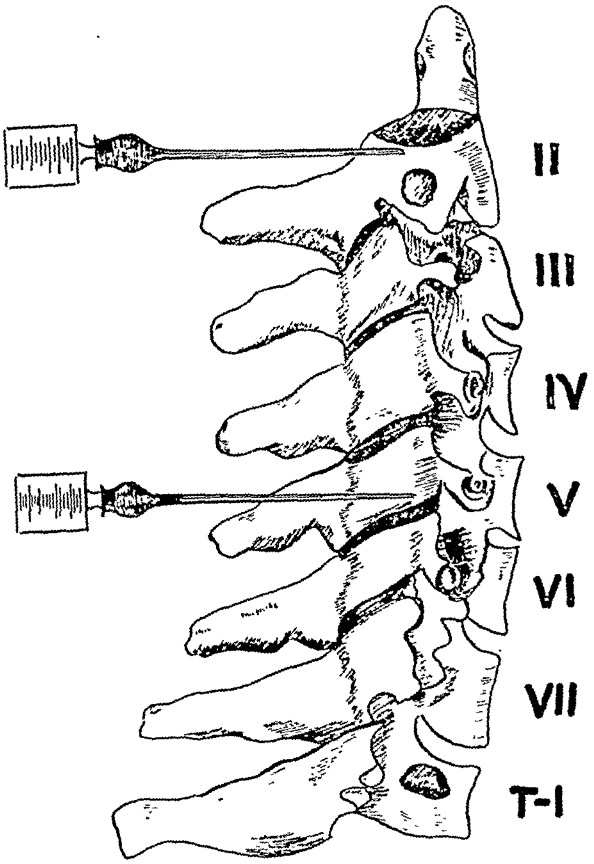

Fig. 2.—Internal site of paravertebral injection.

and then directed toward the midline. When resistance is again encountered, the cortisone or hydrocortisone suspension is infiltrated into the area. If blood is drawn into the syringe before the injection is completed, the needle should be withdrawn and the process repeated in order to avoid the injection of cortisone into a blood vessel. This is considered a paravertebral injection. True intra-articular injection cannot be accomplished because of the nature of the spinal articulations. A similar but more posterior approach may be used in the injection of thoracic and lumbar vertebrae. We have had little success in injecting the lumbosacral joints.

INTRA-ARTICULAR INJECTION OF SACROILIAC JOINTS

Injection of the sacroiliac joints is not a difficult procedure. A long, 21-gauge needle is inserted directly into the upper area of the joint and 12.5 mg. of cortisone or hydrocortisone in aqueous suspension injected. The needle is then withdrawn from the joint, but not from the subcutaneous tissue, and another 12.5 mg. of cortisone or hydrocortisone injected into the lower end of the joint.

Response to Intra-Articular Injection of Cortisone or Hydrocortisone

* Grade 1 = slight relief; grade 2 = moderate relief; and grade 3 = marked relief.
† One patient had osteoarthritis of both sacroiliac joints.

INVESTIGATION

Forty-five patients with osteoarthritis were treated by injection of cortisone or hydrocortisone into or around joints in the spine. The disease affected several sections of the spine, as follows: cervical vertebrae 26 patients, right or left sacroiliac joint 13 patients, right and left sacroiliac joint one patient, thoracic vertebrae 2 patients, lumbar vertebrae 2 patients, and thoracic and lumbar vertebrae one patient. Thus osteoarthritis in 46 locations was treated. The sex distribution among the 45 patients was approximately equal in the groups with each kind of involvement, except that the 3 patients with osteoarthritis of the lumbar spine were women.

Cortisone was injected in 37 instances and hydrocortisone in 9. The portion of the spine affected and the numbers of patients with each type of involvement treated with these substances is shown in the table. The interval between injections of cortisone or hydrocortisone usually was one or two weeks. It was one month in three patients with osteoarthritis of the sacroiliac joint. One patient with similar involvement received only one injection of cortisone and another patient injections of hydrocortisone for only two days. In general, if no benefit occurred after four injections, there was little likelihood of benefit from further injections. When patients improved with treatment, the response was subjective and consisted of varying degrees of relief of pain. The patients' responses were graded as: grade 3, marked relief; grade 2, moderate relief; and grade 1, slight relief. Paravertebral injections as described above were given in each patient with osteoarthritis of the cervical vertebrae. Twenty-two patients in this group received cortisone, and 4 received hydrocortisone. Among the cortisone-treated patients the disease had been present for two to six weeks in 6 patients, for three months to one year in 12, and for three to five years in 4 patients. It had been present between three weeks and three months in three patients treated with hydrocortisone and for one and a half years in the fourth patient in this group. Twelve patients received 2 to 5 injections of cortisone, 8 patients received between 8 and 14 injections, and one patient received 17 and another 21 injections. Hydrocortisone was injected three or four times in the four patients receiving it.

Eighteen, or four-fifths, of the patients treated with cortisone were benefited. Six patients each noted marked, moderate, or slight relief of pain. Four failed to improve. The duration of the disease had little effect on the predictability of the response. Pain disappeared from two of the four patients receiving hydrocortisone, was relieved to a moderate degree in one, and was slightly relieved in another. The groups of patients showing some response are small, but the effect of hydrocortisone did not appear to be superior to that with cortisone.

The pain in the sacroiliac joint of seven patients disappeared during treatment by intra-articular injection of cortisone and was partially relieved in four more. The condition grew worse in one patient who had had osteoarthritis of the sacroiliac joint for "many years." The disease in about half of this group of 12 patients had existed from two weeks to six months and from 1.5 to 15 years in the remainder of patients. Pain of three days' duration in the sacroiliac joint of one patient disappeared when hydrocortisone was injected on two successive days. The disease had been present for four years in the second patient so treated. Two injections of hydrocortisone were given at a one-week interval with no improvement becoming apparent.

With paravertebral injection but a slightly more posterior approach, thoracic vertebrae were injected in three patients, with cortisone in one patient and hydrocortisone in two. Moderate pain relief occurred in the cortisone-treated patient after 14 weekly injections. The disease had existed for 4 and 15 years, respectively, in the other two patients. Although 18 to 23 weekly injections of hydrocortisone were given, pain was only slightly relieved.

Osteoarthritis of the lumbar vertebrae also was only slightly or moderately improved by cortisone in two patients and by hydrocortisone in one long-standing case. Eleven and 12 injections of cortisone, respectively, were given at intervals of one or two weeks. Twenty-three injections of hydrocortisone only slightly relieved the pain around the lumbar vertebrae in the patient who also had the same number of injections around the thoracic vertebrae.

In the original report, injection of cortisone into or around the spine was given in 16 patients with osteoarthritis. Two patients with osteoarthritis of the sacroiliac joint and one with osteoarthritis of the lumbosacral joint improved. Six of seven patients with cervical vertebral disease and five of six with osteoarthritis of lumbar vertebrae improved.

Considering together all of the 62 patients in the two series with osteoarthritis of the spine receiving cortisone or hydrocortisone, 42 (67.7%) were markedly or moderately improved, 12 (19.4%) slightly benefited, 7 (11.3%) unchanged, and one (1.6%) became worse during intra-articular or paravertebral injection. The number of patients receiving hydrocortisone is too small for statistical comparison, but in general the effect with this substance was not superior to that with cortisone.

SUMMARY

Cortisone acetate or hydrocortisone acetate was injected paravertebrally around cervical, thoracic, and lumbar vertebrae and intra-articularly into the sacroiliac joints of 46 patients with osteoarthritis affecting one of these portions of the spine. The disease was of long standing in some of the patients in each group. Injections varied in number from 1 to 23 and were usually given at intervals of one to two weeks. Thirty-seven patients received cortisone acetate and nine hydrocortisone acetate. Subjective improvement consisting of relief of pain occurred in 40 patients. This was marked in 16, moderate in 12, and slight in 12. Five patients showed no change, and one grew worse during treatment. The effect of hydrocortisone did not appear to be superior to that of cortisone. If no benefit was apparent after four injections, it did not usually occur with further injections.

ADDENDUM

Subsequent to the submission of this report, we have studied prednisolone (Meticortelone) acetate injections of 25 mg. per cubic centimeter utilized as above. There were six patients with cervical osteoarthritis and four with dorsal osteoarthritis. The number of injections were cervical 48 and dorsal 22, with no untoward reactions. Intervals of injections were as above. Percentage of results were the same.

DETERMINATION OF ARTERIAL BLOOD PRESSURE IN THE LOWER EXTREMITY

USE OF AN EIGHTEEN CENTIMETER SPHYGMOMANOMETER THIGH CUFF

Capt. Oscar L. Sapp, Major Glen K. Arney
and
Col. Thomas W. Mattingly, (MC), U. S. Army

Determination of the arterial blood pressure in the lower extremity is an important part of the physical examination. This simple procedure is of particular value in the diagnosis of various conditions in which there is a significant disparity between the pressure in the arterial system of upper and lower extremities. Such conditions include (*a*) congenital coarctation of the aorta, (*b*) acquired occlusive diseases of the aorta and large arteries of the lower extremities, (*c*) extrinsic compression of the aorta, and (*d*) aortic aneurysms.

The presence of palpable pulses in the peripheral arteries of the lower extremity does not necessarily exclude the above conditions. Even an experienced clinician cannot detect minor but often significant differences in the volume of the pulses in the two extremities. Palpation of the pulses in the peripheral arteries of the lower extremities in individuals suspected of having coarctation of the aorta is an unreliable screening procedure to eliminate the existence of this lesion.[1] Accurate and prompt diagnosis of the above conditions is important, as the majority of them can be corrected by surgery or improved by appropriate medical management. On the

Lieut. Col. Herschel E. Griffin, M. C., and Corp. Irwin Kluger, Army Medical Service Graduate School, Walter Reed Army Medical Center, Washington, D. C., made the statistical analysis of these data.

[1] Dacquisto, M. P., and Mattingly, T. W.: To be published.

other hand, the determination of the arterial blood pressure in the lower extremity is not of particular diagnostic value in a variety of other vascular and nonvascular conditions.[2]

The technical difficulties involved in applying the standard 12 cm. cuff to the adult thigh caused our attention to be directed to the use of a nonstandard cuff, 18 cm. in width, especially designed to fit the adult thigh. This cuff is of a tubular design, made of heavy cloth, has easily adjustable hook straps, and remains in place during inflation. In using this cuff the values obtained differed markedly from the accepted normal for the lower extremities. Several studies have been made with use of sphygmomanometers with cuffs 12 cm. and 15.5 cm. in width, as well as direct intra-arterial measurements. Our studies are in agreement with the accepted normal blood pressure values in the upper and lower extremities when the standard 12 cm. sphygmomanometer cuff is used. They also indicate factors that modify the normal readings. The weight of the patient and the circumference of the extremity are factors that cause diversity in the normal.[3] Some observers believe the circumference to be directly related to the body weight, and the weight may therefore be the most important factor.[4] It has previously been shown that cuff size will vary readings in the same individual.[5] The influence of such factors as exercise, posture, venous congestion, and emotional lability are well recognized [6] and are not pertinent to this presentation.

It is recognized that blood pressure as measured by the sphygmomanometer is not exact. Comparison with direct intra-arterial measurements show the brachial artery systolic pressure to be 3 to 4 mm. Hg too low and the brachial diastolic pressure to be 8 mm. Hg too high.[7] Van Bergen and others [8] have shown, more recently, that the indirect readings tend to fall increasingly below the direct measurements as the blood pressure rises.

Prior to 1924 there was thought to be no difference in the arterial blood pressure in the upper and lower extremities of normal persons. In that year Bazett [9] demonstrated, in dogs, a higher systolic pressure in the femoral than in the brachial artery. The following year Burdick,[10] using photomanometric devices, recorded pressures simultaneously in the brachial and femoral arteries in human beings. He found, in normal human beings, the femoral arterial blood pressure consistently higher than the brachial arterial blood pressure. These observations have been confirmed by subsequent investigators.[11] The average values found by these workers, using a 12 cm. cuff, in the upper extremity were between 115 to 118 mm. Hg systolic and 70 to 77 mm. Hg diastolic. Using the same cuff in the lower extremity values of 150 to 154 mm. Hg systolic and 91 to 104 mm. Hg diastolic were obtained. Kotte and others [5] confirmed these findings in the upper and lower extremity using a 12 cm. cuff, but using a 15.5 cm. cuff in the lower extremity they found an average reading of 133 mm. Hg systolic and 85 mm. Hg diastolic. Intra-arterial femoral blood pressure determinations done on the same subjects revealed a systolic pressure of 126 mm. Hg and a diastolic pressure of 63 mm. Hg, indicating that the wider cuff was more accurate in determining the true systolic blood pressure in the lower extremity. These investigations were made with the patients in either the supine or prone position and do not reflect the effects of gravity.

Not having an established normal value for the 18 cm. cuff for blood pressure determination in the lower extremity, we undertook a study to determine such values and to find if the relationship of the values for the upper and lower extremities is statistically significant.

METHOD

One hundred adult males who did not have demonstrable cardiovascular disease were selected for study. All pressure determinations were made and recorded by us. Blood pressure determinations were made in both upper extremities and the right lower extremity with the standard 12 cm. cuff and in the right lower extremity with the specially constructed 18 cm. cuff. These determinations were made with the subjects under near basal conditions, supine for readings in the upper extremity and prone for readings in the lower extremity. The systolic end-point was interpreted as being the onset of the vascular sound and the diastolic end-point as being the cessation of sound. This was done in accordance with the recommendations of the American Heart Association.[12] Additional data accumulated consisted of height, weight, and the circumference of the thigh taken at a point 20 cm. above the upper margin of the patella. The age of the patients was not considered significant, since all persons examined were between 18 and 30 years of age. The blood pressure determinations are tabulated in table 1. There was no significant difference in the readings obtained in the right and left upper extremity, and only the values obtained in right arm are given.

The data presented in table 1 were subjected to statistical analysis. As shown in table 2, there is a significant difference between the systolic and the diastolic readings in the lower extremity with use of the cuffs of different width. The 18 cm. cuff shows a significantly lower systolic and diastolic blood pressure reading than the 12 cm.

cuff ($p<0.001$). The average pulse pressure in the lower extremities obtained with the 12 cm. cuff was 63.21 mm. Hg, and that obtained with the 18 cm. cuff was 54.14 mm. Hg. For the 100 adult males examined the pulse pressure was significantly greater in the 12 cm. cuff determinations.

As demonstrated by the figure, there is a relationship wherein a systolic blood pressure obtained with an 18 cm. thigh cuff could predict a systolic reading that might be obtained with a 12 cm. thigh cuff. The best fitting regression line is obtained by the least squares method and is: $y = x + 23.6$, where x is the systolic reading with the 18 cm. cuff and y is the systolic reading with the 12 cm. cuff. The data were subjected to the analysis of variance in order to see how well they fitted the curve. Table 3 summarizes the analysis of variance.[13] The F ratio clearly indicated that the chances are less than one in a thousand of obtaining an F value of this magnitude if there is no linear relationship between x and y. It should be expected that this relationship would be present, inasmuch as the same values were measured in each instance.[13] This relationship is real but not precise, i. e., a reading with use of one of the cuffs is not readily translatable into an expected reading with use of the other cuff.

TABLE 2.—*Summary of Blood Pressures, Upper and Lower Extremities, in 100 Adult Male Subjects*

Size of Cuff	Blood Pressure	Mean Blood Pressure	Standard Error of Mean
12 cm. (arm)................	Systolic	124.20	1.25
	Diastolic	74.25	0.87
12 cm. (thigh)...............	Systolic	157.36	1.80
	Diastolic	94.15	1.10
18 cm. (thigh)...............	Systolic	134.43	1.43
	Diastolic	80.29	0.95

There was no statistical relationship apparent between the thigh size and the blood pressure obtained with the 18 cm. cuff, nor was there a significant relationship between the diastolic readings, as obtained with the different cuffs, in the lower extremity.

In all instances, in this small group of normal patients, the systolic blood pressure in the thigh, as determined with either the 12 or 18 cm. cuff, was found to be higher than the blood pressure in the arm, as determined with the 12 cm. cuff. As shown in table 1, the pressure in the thigh as determined with the 18 cm. cuff more closely approximates the arm pressure as determined with the standard 12 cm. cuff. It is our opinion that a systolic pressure in the thigh lower than the systolic pressure in the arm, with use of either the 12 cm. or 18 cm. cuff, is indicative of organic disease and makes further diagnostic study mandatory.

TABLE 3.—*Analysis of Variance to Test for Linearity Between Systolic Readings* *

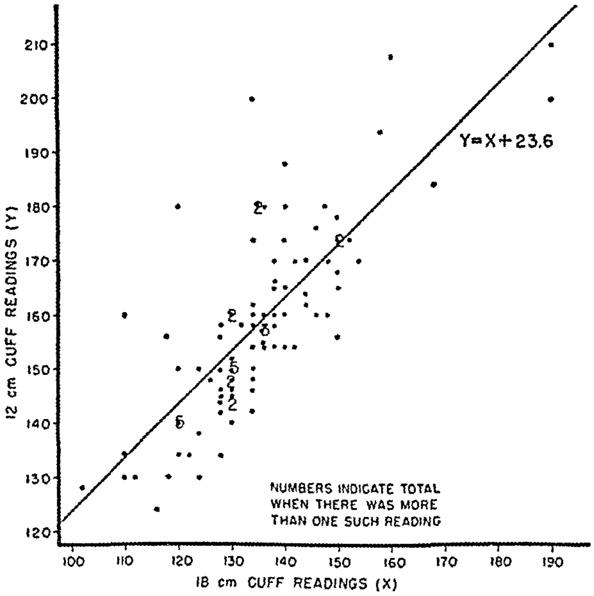
* As obtained with the 12 cm. and 18 cm. sphygmomanometer cuffs (thigh).

† Ratio of the larger mean variance between samples to the smaller mean variance within samples.



Systolic blood pressure of 100 adult males obtained with 12 and 18 cm. cuffs (thigh).

SUMMARY AND CONCLUSIONS

A study was made of the arterial blood pressure values obtained in the thigh with a nonstandard 18 cm. sphygmomanometer cuff. It is apparent that there is a significant difference in pressures so obtained when compared to the pressures obtained with the standard 12 cm. arm cuff, the difference being especially significant in the level of the systolic pressure. It is important that the examining physician recognize this difference, and when different-sized cuffs are used they should be so defined in order that values may be properly interpreted and evaluated.

---

13. Snedecor, G. W.: Statistical Methods Applied to Experiments in Agriculture and Biology, ed. 4, Ames, Iowa, Iowa State College Press, 1946, pp. 61, 127.

The values obtained with the 18 cm. cuff more closely approximate the intra-arterial reading in the femoral artery than do the values obtained from the use of the 12 cm. or 15.5 cm. cuff in the normal adult patient. This and the ease of application makes the larger cuff a more desirable diagnostic tool. It is recommended that the committee on standardization of blood pressure of the American Heart Association give consideration to a standard for procedure and normal values for the arterial blood pressure in the lower extremity.

CLINICAL NOTES

SUBACUTE BACTERIAL ENDOCARDITIS TREATED BY INTRAVENOUSLY GIVEN ERYTHROMYCIN

REPORT OF A CASE

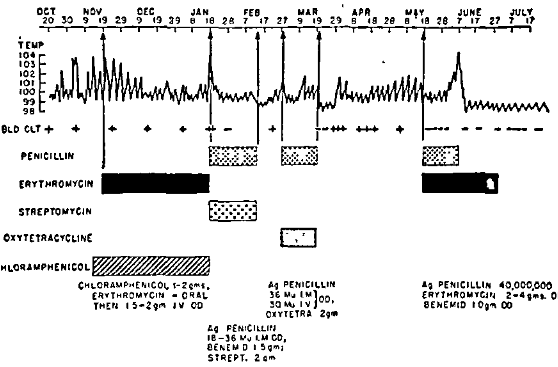
Jonathan S. Bishop, M.D.
William P. Smith, M.D.
Joanne Lloyd-Jones, M.D.
and
Christopher Longcope, M.D., New York

The present communication reports the apparent cure with intravenously given erythromycin of an antibiotic-resistant, nonhemolytic, streptococcic, bacterial endocarditis.

A 38-year-old woman was referred to our hospital on Jan. 18, 1954, with the diagnosis of an antibiotic-resistant "staphylococcic" endocarditis. The patient reported that she was a "blue baby" at birth and that she had always had a soft asymptomatic heart murmur. On Sept. 15, 1953, the patient underwent an uncomplicated dilation and curettage for menometrorrhagia of two months' duration. Because of the history of possible congenital heart disease, she was given prophylactic doses of penicillin, 1,000,000 units a day, for the six days of her hospitalization. On Oct. 15, the patient was readmitted to the same hospital with pain in her legs and a fever spiking to 104 F (40 C). A tentative diagnosis of pelvic thrombophlebitis was entertained, but pelvic examination was negative and positive blood cultures soon established the diagnosis of subacute bacterial endocarditis. The organism isolated was reported to be nonhemolytic "Staphylococcus," sensitive to chloramphenicol, bacitracin, and erythromycin but resistant to penicillin, dihydrostreptomycin, chlortetracycline, oxytetracycline, and polymixin. In the ensuing two and one-half months she was given therapeutic courses of chloramphenicol, bacitracin, sulfisoxazole (Gantrisin), and erythromycin. Chloramphenicol was given alone in amounts ranging from 250 to 500 mg. every six hours for a three week period and later in combination with the other two drugs. Bacitracin and erythromycin were given both orally and parenterally. Erythromycin was also given intravenously for a three week period, 1 gm. twice daily. During this time the blood cultures remained positive and the patient's temperature ranged from 100 to 101 F (37.7 to 38.3 C). In addition, her apical systolic murmur increased in intensity, and she experienced three episodes of pulmonary edema, for which she was digitalized. On Jan. 18, 1954, she was transferred to our hospital for further treatment.

Physical Examination.—On physical examination temperature was 100 F; pulse 100, regular; respirations 18; and blood pressure 105/60 mm. Hg. There were subsiding Osler's nodes and marked clubbing of the fingers but no icterus or petechiae. The heart was slightly enlarged to percussion, with the pulmonic second sound much accentuated, and there was a harsh precordial systolic murmur, loudest in the third intercostal space to the left of the sternum and transmitted to the left posterior part of the thorax. There was no evidence of heart failure, and the spleen was not palpable.

Laboratory Data.—The hemoglobin level was 13 gm. per 100 cc. and the leukocyte count 9,000 per cubic millimeter, with marked shift to the left. The urine was negative except for 3+ proteinuria, clearing rapidly after admission. Erythrocyte sedimentation rate was 48 mm. in one hour (Westergren), blood urea nitrogen 9 mg. per 100 cc., thymol turbidity 3+, and protein partition albumin 4.6 and globulin 3.3 gm. per 100 cc. The electrocardiogram was normal. A 2 m. chest film revealed clear lungs and a slightly enlarged heart, with accentuation of the outflow tract of the right ventricle on cardiac fluoroscopy. Cardiac catheterization ruled out patent ductus arteriosus but did not enable us to distinguish between rheumatic valvular disease and a ventricular septal defect. Blood cultures in our laboratory revealed the organism actually to be a nonhemolytic Streptococcus relatively insensitive to penicillin and streptomycin and sensitive to oxytetracycline and erythromycin.



Course of patient with subacute bacterial endocarditis.

Course.—Initial treatment was with aqueous penicillin, 3 million units every four hours intramuscularly; streptomycin, 0.5 gm. every six hours intramuscularly; and probenecid (Benemid), 0.5 gm. every eight hours orally (see figure). During this regimen blood levels of penicillin were 25 units per cubic centimeter two hours after and 12 units per cubic centimeter four hours after an injection of the antibiotic. In vitro sensitivity studies revealed that the organism was inhibited by 10 units per cubic centimeter of penicillin alone, 40 mcg. per cubic centimeter of streptomycin alone, or by a combination of 1 unit per cubic centimeter of penicillin and 5 mcg. per cubic centimeter of streptomycin. Because of this apparent resistance to penicillin, the dosage of that drug was doubled 10 days after therapy was begun and the course continued for another 15 days, with penicillin levels of 25 units per cubic centimeter four hours after the injection. During this 25 day period blood cultures were sterile and the patient afebrile, but 7 days after cessation of therapy blood cultures were once again positive. Now the organism was found to be inhibited in vitro by 20 units per cubic centimeter of penicillin alone, not inhibited by 100 mcg. per cubic centimeter of streptomycin alone, but inhibited by a combination of 4 units per cubic centimeter of penicillin in combination with 2 mcg. per cubic centimeter of oxytetracycline.

On Feb. 28, 1954, another course of antibiotic therapy was begun, with penicillin, 6 million units every four hours intramuscularly and 10 million units every eight hours intravenously (for only 66 million units per day); oxytetracycline, 0.5 gm. orally every six hours, and probenecid. After five days, an additional 250 mg. of oxytetracycline was given every eight hours in each infusion of penicillin. Blood levels of 40 units per cubic centimeter of penicillin and 8 to 10 mcg. per cubic centimeter of oxytetracycline were obtained. Once again blood cultures be-

---

From the Department of Medicine, Columbia University College of Physicians and Surgeons, and the Presbyterian Hospital in the City of New York.

The erythromycin glucoheptonate used in this case was supplied as Ilotycin by Eli Lilly Co., Indianapolis.

came sterile, but the patient's spleen became palpable and she developed distressing gastrointestinal symptoms with weight loss. She also developed extensive multilocular gluteal abscesses that had to be drained surgically, so that, after 18 days' treatment, when further intramuscular injections were impossible and all veins for intravenous administration of penicillin had been used, this therapy was discontinued. One week later blood cultures were positive again. While healing of the gluteal abscesses was awaited, the patient was given the following medication orally: tetracycline, 1 gm. per day, and benzathine penicillin G (Bicillin), 10 million units per day, with probenecid; but the blood levels of penicillin were only 0.2 units per cubic centimeter, and the blood cultures remained positive. A combination of neomycin, bacitracin, and streptomycin, which was particularly effective in vitro, had to be discontinued after 36 hours because of a return of the albuminuria and extreme pain in the quadriceps injection site.

With a return of fever spiking to 102 F (38.8 C), the situation became increasingly desperate. A reevaluation of the organism's sensitivities indicated that 3 mcg. per cubic centimeter of erythromycin was inhibitory. It was hoped that high blood levels of this drug maintained by a constant infusion would be effective where oral and intermittent intravenous administration had failed previously. Consequently 2 gm., increased after one week to 4 gm., of erythromycin was given daily, intravenously, for six weeks. In addition, 40 million units of penicillin was given daily intravenously for the first 18 days, empirically. A polyethylene catheter inserted into the lower saphenous veins caused much local thrombophlebitis and temperature spikes despite the use of heparin in the infusions. Finally, although the catheter was threaded from the femoral triangle far into the iliac vein, it was not until intravenous administration of penicillin was discontinued that these complications ceased. For the last three and one-half weeks, 4 gm. of erythromycin (plus heparin) was administered daily without incident, and blood levels of 12 to 18 mcg. per cubic centimeter were maintained. During this course, as before, blood cultures became sterile, but this time there was no recurrence of bacteremia after treatment. At the time of writing, four months after treatment, blood cultures are reported to be sterile. The patient writes that she is at home, gradually gaining weight and strength, and has had no evidence of congestive heart failure on a regimen of digitoxin and limited activity. Her main complaint is dizziness and ataxia, which is essentially unchanged since discharge and probably is a result of streptomycin intoxication.

COMMENT

This case illustrates the value of laboratory determinations of bacterial sensitivities and blood levels of the drugs used as aids to adequate antibiotic treatment of subacute bacterial endocarditis caused by an antibiotic-resistant organism. It also shows the effectiveness and freedom from toxic effects of intravenous administration of a relatively new antibiotic that was previously considered to be only bacteriostatic, like the other broad-spectrum antibiotics. The importance of erythromycin alone in effecting the cure in this case is impossible to assess because of the concomitant administration of penicillin for the first 18 days of treatment. A synergistic effect was hoped for, and cannot be ruled out, although it is noteworthy that a larger daily dose of penicillin (66 million units) with oxytetracycline, a known in vitro synergistic combination, failed to cure. It is unfortunate that in vitro synergistic tests of penicillin and erythromycin in combination were not carried out against this organism, especially since synergism is postulated in erythromycin-streptomycin combination.[1] At the time of this work a report on the only long-term clinical experience with intravenously given erythromycin had not been published; in this experience 3.5 gm. was administered daily for two weeks to a 30 lb. (13.6 kg.) child with subacute bacterial endocarditis. This case has now been reported, along with other observations on the effectiveness of intravenously given erythromycin.[2]

SUMMARY

The cure of a case of subacute bacterial endocarditis caused by a nonhemolytic Streptococcus, resistant to large doses of antibiotics, was effected by the use of erythromycin, 4 gm. daily, in a continuous intravenous drip for six weeks. No toxic effects of this drug were noted. There was a possible synergistic effect from 40 million units of penicillin added daily to the erythromycin infusion for the first 18 days. An indwelling polyethylene catheter was effectively used for the long-term administration of a heparinized infusion of the antibiotic.

ADDENDUM

In May, 1955, 10 months after discharge from the hospital, follow-up showed sterile blood cultures and slight cardiac enlargement on x-ray. The patient was continuing to improve her exercise tolerance within narrow limits and still required digitalis and had some degree of ataxia.

HAZARD OF CORTICOTROPIN AND CORTISONE THERAPY IN PATIENTS WITH HYPERCHOLESTEREMIA

David Adlersberg, M.D.
Jenny Stricker, M.D.
and
Hillard Himes, M.D., New York

Thromboembolic phenomena may represent a serious complication of the use of corticotropin and cortisone.[1] These complications were observed in five patients with hypercholesteremia, idiopathic or secondary to other disease, leading to the impression of a causal relationship between the preexisting elevated level of serum cholesterol and the thromboembolic phenomena.

REPORT OF CASES

CASE 1.—A 52-year-old female was hospitalized on Feb. 21, 1952, because of diarrhea and abdominal pain. For two years prior to admission, she had been subject to intermittent attacks of severe abdominal cramps and diarrhea. The stools were foul-

---

W.: Thromboembolic Complications Associated with ACTH and Cortisone Therapy, J. A. M. A. **147**: 924 (Nov. 3) 1951.

smelling and foamy. She complained frequently of bloating and postprandial discomfort. Study in 1950 revealed a normal gastrointestinal x-ray series and barium enema. Repeated stool analyses showed many fat globules, no ova or parasites, and a negative guaiac reaction. The hemoglobin level was 11.4 gm. per 100 cc. The white and differential blood cell counts were normal. On therapy consisting of a sprue diet supplemented with folic acid, she showed gradual improvement. Three days prior to admission, however, she again began to have severe abdominal pains, with as many as 20 diarrheal movements daily. Hospitalization was necessary because of marked dehydration.

Physical examination revealed an acutely ill female. There was marked dehydration of skin and mucous membranes. Blood pressure was 115/72 mm. Hg; pulse, 88 per minute; respiration, 20 per minute; and temperature, 98.6 F (37 C). The abdomen was somewhat distended and diffusely tender. Physical examination was otherwise negative. Urinalysis was normal. Hemoglobin level was 12.6 gm. per 100 cc.; white blood cell count was 8,750 per cubic millimeter, with segmented cells 53%, nonsegmented 10%, lymphocytes 33%, monocytes 4%, and reticulocytes 0.4%. Sedimentation rate was 60 mm. per hour (Westergren). Stool examinations revealed a few fat globules, no ova or parasites, and a negative guaiac reaction. Serum cholesterol level was 314 mg. per 100 cc. The oral glucose tolerance test (100 gm. glucose) was flat. A gastrointestinal x-ray series revealed a mild deficiency pattern.

For the first two days, treatment consisted of intravenous infusions supplemented with vitamins. Temperature was slightly elevated for the first four days. In view of the tentative diagnosis of sprue and because of the persistence of abdominal pain and diarrhea, therapy with corticotropin (ACTH) gel by intramuscular injection was instituted. The following doses were given: March 15, 20 mg.; March 16, 80 mg.; and March 17, 80 mg.—a total of 180 mg. On this therapy, the abdominal pain disappeared, the bowel movements diminished to two daily, and the patient became euphoric. On the morning of March 18, she was awakened by crushing anterior chest pain. She was acutely ill, orthopneic, and cyanotic. Blood pressure was 146/85 mm. Hg and pulse rate was 110 per minute. The heart sounds were of good quality. The electrocardiogram revealed S-T and T-wave changes suggesting coronary insufficiency. Corticotropin therapy was discontinued. On the following day, the condition remained critical. She suffered another attack of crushing precordial pain accompanied by profuse diaphoresis. The blood pressure was 150/90 mm. Hg; the pulse, 132 per minute; and temperature, 101 F (38.3 C). The electrocardiogram revealed depression of S-T in lead 2 and inversion of T wave in lead 3. The clinical impression was that of an acute myocardial infarction. Treatment with bishydroxycoumarin and digitalis was instituted. Meperidine (Demerol) was required repeatedly for chest pain. On the third day a loud precordial friction rub was heard. Sedimentation rate rose from 33 to 65 mm. per hour. On March 22, the electrocardiogram showed further S-T depression and T wave inversion. Her condition gradually improved. On April 9, the electrocardiogram was normal. Since discontinuation of corticotropin therapy, she has had no further diarrhea and only minimal abdominal discomfort. Because of the elevated levels of her serum cholesterol (314 mg. per 100 cc.), the patient's siblings who were clinically well were studied. The data are summarized in the table.

Case 2.—A 38-year-old male was hospitalized in May, 1953, because of pain and swelling of the ankles and hands of five weeks' duration. The patient gave a history of two or three attacks of joint pain and swelling yearly since 1943. Therapy (salicylates) in previous attacks gave only partial relief. For the present attack, he took cortisone irregularly in doses of 100 to 150 mg. daily for several days without relief. Physical examination revealed a well-developed obese male. Tenderness was present over the internal and external malleoli bilaterally and over the phalangeal heads on the undersurface of the toes of both feet. He was unable to flex the third and fourth fingers of the right hand, and there was redness and swelling of the interphalangeal joints. The physical examination was otherwise within normal limits. The blood cell count revealed 10,400 white blood cells per cubic millimeter with a normal differential count; hemoglobin level, 15.3 gm. per 100 cc.; sedimentation rate, 5 mm. per hour; hematocrit value, 52%. Urinalysis was normal. Serum uric acid level was 3.5 mg. per 100 cc. Antistreptolysin titer was less than 100 units. Roentgenograms of the involved joints showed no abnormalities.

For four days after admission, the patient received salicylates with no improvement. Ten days after admission, therapy with cortisone, given orally in doses of 200 mg. daily, was instituted. After 13 days, the patient felt so well that he was permitted to leave the hospital on a pass. On the same afternoon, while changing an automobile tire, he developed sudden severe pain in his right lower chest. The pain was aggravated by deep breathing and coughing and was accompanied by diaphoresis and severe headache. Despite bed rest, cough and chest pain increased in severity and the patient returned to the hospital. At this time he was complaining of excruciating precordial pain radiating down the right arm and of severe coughing.

Physical examination revealed a desperately ill male. Temperature was 104 F (40 C) and pulse rate, 120 per minute. The patient was extremely apprehensive, covered with perspiration, and was in marked distress from the chest pain. There was dulness at the right lung base, with decrease in breath sounds and tactile fremitus in this area. There was no evidence of peripheral venous thrombosis. The electrocardiogram revealed a deepening of S in leads 1 and AVL, with lowering of T waves in leads 1, V_5, and V_6. Roentgenogram of the chest revealed an infiltration at the right base compatible with pulmonary infarction. Shortly thereafter he began to expectorate blood-tinged sputum. A pleural friction rub was heard at the right base. Anticoagulant therapy was instituted with heparin and bishydroxycoumarin. At this time clotting and prothrombin values were normal. For the next five days, the patient's condition remained critical, with persistence of cyanosis, tachypnea, hemoptysis, fever, and leukocytosis. Roentgenologic changes and clinical signs consistent with small infarctions in the opposite lung field appeared during this period. The patient's condition improved slowly. The fever persisted for 10 days and the chest signs for 20 days. At this point anticoagulant therapy was discontinued and the patient was discharged. In view of the observations made concerning familial hypercholesteremia in case 1, serum cholesterol studies were performed in the patient. The level was 298 mg. per 100 cc. The results obtained in his immediate family are summarized in the table.

Case 3.—A 40-year-old male was hospitalized because of sudden onset of severe anterior chest pain. He had suffered a myocardial infarction at the age of 36. At this time xanthoma tendinosum over the metacarpophalangeal joints of both hands and of the Achilles tendons was noted. His father died of myocardial infarction at the age of 52. Four days prior to the current admission he took hydrocortisone, in doses of 20 mg. several times daily, for gouty arthritis. He had taken a total of 220 mg. of the drug when he was seized with sudden precordial chest pain radiating to the back and neck. The pain was aggravated by respiration and was accompanied by a temperature of 102 F (38.9 C). Two days later, x-ray examination revealed blunting of the left phrenicocostal sinus. The electrocardiogram showed changes consistent with the diagnosis of an old myocardial infarction. The clinical impression was that the patient had suffered a pulmonary embolus. Recovery was uneventful. Serum cholesterol level when first observed was 440 mg. per 100 cc., falling to 322 mg. per 100 cc. on a low-fat, low-cholesterol diet. Serum uric acid level was 7 mg. per 100 cc. The serum cholesterol levels of the patient's siblings are presented in the table.

CASE 4.—A 47-year-old female with known duodenal ulcer and rheumatoid arthritis was hospitalized because of melena. For the past eight years she had been suffering from severe rheumatoid arthritis involving multiple joints of the extremities. Because of progressive disability and failure to respond to other forms of antirheumatic therapy, a course of cortisone therapy was thought to be indicated. The duodenal ulcer, which had been demonstrated radiologically several years previously, was considered to have healed under appropriate therapy. Consequently, for the four months prior to admission, she received cortisone orally, in doses of 100 mg. daily in divided doses. On this therapy there was considerable symptomatic improvement. One day prior to admission she began feeling faint and noticed melena. She was hospitalized and given a transfusion. Cortisone therapy was discontinued. On the day after admission, she suddenly developed precordial pain and dyspnea. Examination at this time revealed extreme respiratory distress, tachypnea, orthopnea, and cyanosis. Blood pressure was 95/65 mm. Hg; pulse rate, 100 per minute; respiration, 30 per minute; and temperature 100 F (37.8 C). There were diminished breath sounds at the right base and coarse rales at the left base. Examination of the heart revealed sinus tachycardia; the second pulmonic sound was accentuated. Sedimentation rate was 100 mm. per hour (Westergren) and hemoglobin level, 10 gm. per 100 cc.; white blood cell count was 10,000 per cubic millimeter, with a normal differential count. Chest roentgenogram revealed fluid at the right base, increased markings, and multiple plate-like areas of atelectasis at both bases. Electrocardiogram showed low T waves in leads 2, V_2, and V_3. Repeated electrocardiograms showed diphasic T waves and depressed S-T segments in the precordial leads. Cholesterol level was 390 mg. per 100 cc., with 250 mg. per 100 cc. esters. The diagnosis of multiple pulmonary infarctions was made. The patient was treated with bed rest, oxygen, antibiotics, and digitalis. Her condition remained critical for two weeks and improved slowly thereafter. Analyses of serum cholesterol revealed values between 340 and 390 mg. per 100 cc., with esters 205 to 250 mg. per 100 cc. There were no members of the patient's family available for study.

COMMENT

Considerable attention has been accorded certain of the complications attending the use of corticotropin and the cortisones. Physicians are constantly alert to the possibility of ulcerations with bleeding and perforation of the gastrointestinal tract, alterations of cardiovascular dynamics including those caused by salt and water retention, and abnormalities in the central nervous system, to name but a few possible sequelae. The likelihood of the occurrence of thromboembolic phenomena, a complication of corticosteroid therapy more likely to terminate fatally, has received less prominence than its seriousness and incidence warrant.

The group of patients presented in this paper developed thromboembolism after the institution of corticotropin or cortisone therapy for a variety of diseases. There was a striking time relationship between the institution of hormone therapy and the onset of the complications. The ages of these patients ranged from 38 to 52. Two patients were men and two were women. One patient was treated for a sprue-like syndrome, one for gout, and two for rheumatoid arthritis. Study of the group revealed one common denominator, namely, elevation of the serum cholesterol level above the upper limit of normal (280 mg. per 100 cc. by the Schoenheimer-Sperry method). In three instances in which family members were available for study, the familial character of the abnormality was suggestive.

Several clinical observations deserve brief discussion. In the patient in case 1, a myocardial infarction occurred after only three days of corticotropin therapy. This relatively short duration of therapy, in our opinion, does not preclude the possibility of a causal relationship. Eisenmenger and his associates [2] have observed portal vein thrombosis occurring after even shorter periods of therapy (see below). The patient presented in case 2 was fully ambulatory for a period of two weeks prior to the occurrence of pulmonary infarctions. Consequently, we do not believe that the exertion of changing a tire was an important contributing factor. The patient presented in case 3 was the only person of the four showing evidence of preexisting cardiovascular disease. He developed a pulmonary infarction after a short period of hydrocortisone therapy. It was not our impression that there was any relationship between the pulmonary infarction and the myocardial infarction that had occurred four years previously. In the patient presented in case 4, it is difficult to evaluate the possible role of anemia. It must be stressed, however, that the anemia was of moderate degree. The clinical impression in all these patients was that corticotropin and cortisone might have been a contributing factor in the production of the thromboembolic phenomena.

Predisposition to vascular disease is a common accompaniment of the error of lipid metabolism of which hypercholesteremia is a part.[2a] One may then conclude that any drug associated with the risk of thromboembolism should be used with caution in patients in whom the predisposition to vascular disease already exists. Our observations are in agreement with those of other workers who encountered thromboembolic complications after the use of corticotropin and cortisone. Cosgriff and his co-workers [1c] observed 40 episodes of thromboembolism in 28 of 700 patients treated with corticotropin or cortisone. Smith [1a] and Cosgriff [1b] demonstrated that a state of hypercoagulability results from steroid therapy. Cosgriff [1b] emphasizes the necessity for maintaining an awareness of the potentiality of these agents for producing a prethrombotic state, particularly in patients in whom other factors are present that also predispose to intravascular thrombosis. To these other factors, which include infection, postoperative and postpartum state, malignancy, and bed rest, we would like to add, on the basis of our experience, an abnormal state of lipid metabolism manifested by hypercholesteremia. In these individuals the combination of the predisposition to vascular disease and the tendency to hypercoagulability may act synergistically in producing intravascular clotting.

Eisenmenger and co-workers [2] observed portal thrombosis in three patients treated with corticotropin for cirrhosis of the liver. Cessation of gingival bleeding was observed in four patients. Since patients with advanced cirrhosis exhibit deficiencies in blood coagulation factors, including plasma prothrombin, fibrinogen, and platelets, these observations were of additional importance. It is of interest, however, that Russek and co-workers[3] failed to observe a single instance of thromboembolism in 86 patients suffering from advanced cardiovascular and/or cerebral vascular disease, who were treated with large doses of cortisone. Fourteen of these patients were bedridden, while 72 were ambulatory or semiambulatory. In our opinion, there is considerable risk involved in the use of corticosteroid therapy in patients suffering from coronary disease. We have seen several thromboembolic complications in patients in this category treated with corticosteroids.

[2a] Adlersberg, D.: Hypercholesteremia with Predisposition to Atherosclerosis: An Inborn Error of Lipid Metabolism, Am. J. Med. **11**: 600, 1951.

A question of practical importance concerns the use of anticoagulant therapy in individuals predisposed to vascular disease receiving corticosteroid therapy. Cosgriff[1c] and Eisenmenger[2] recommend the use of anticoagulants. The latter suggests the use of heparin in preference to bishydroxycoumarin. Russek[3] emphasizes that the potential dangers of anticoagulant therapy far outweigh those of corticosteroid therapy. The following case illustrates, however, the advisability of the use of anticoagulants in association with corticosteroid therapy in predisposed individuals.

CASE 5.—A 52-year-old man was suffering from the nephrotic stage of glomerulonephritis. He was treated with corticotropin and cortisone in an attempt to promote diuresis. He had had a myocardial infarction four years previously and subsequently had several attacks of angina pectoris. During the course of steroid therapy, he experienced attacks of crushing, severe chest pain, which subsided when the medication was discontinued. Although the electrocardiograms showed no changes, it was decided that, since these attacks were anginal in character, anticoagulants should be given in conjunction with the hormonal therapy. Whereas previously he had developed chest pains within a few days after the start of steroid therapy, he remained asymptomatic when anticoagulants were used simultaneously. On a subsequent occasion when cortisone was given without anticoagulants, he developed anginal pain and electrocardiographic evidence of acute myocardial infarction. The serum cholesterol level of this patient was in the range of 500 mg. per 100 cc.

SUMMARY

Four patients, ranging in age from 38 to 52 years, suffered thromboembolic accidents while undergoing treatment with corticotropin or the cortisones for a variety of illnesses. Serum cholesterol level was elevated in all of these patients, only one of whom had clinically evident preexisting cardiovascular disease. Examination of the members of the three families available for study defined the hypercholesteremia as being familial in nature. We suggested that the hypercoagulability induced by the corticosteroids, when superimposed on the vascular disease that may be associated with this metabolic error, acts synergistically to predispose the individual to thromboembolic phenomena. Caution in the administration of steroid therapy to hypercholesteremic individuals is advised. Prophylactic anticoagulant therapy may be indicated in some instances.

PARAGONIMUS WESTERMANI INFESTATION INVOLVING THE ANTERIOR ABDOMINAL WALL

REPORT OF A CASE SIMULATING ACUTE APPENDICITIS

Saul Kay, M.D., Richmond, Va.

As the geographical distribution[1] of Paragonimus westermani infestation in humans is generally confined to the Far East, and especially to parts of Japan, Korea, and Formosa, it is not expected that the American physician would ordinarily come in contact with patients harboring these parasites. The quartering of our troops in Japan, however, and especially the recent campaigns in Korea, should make us more alert to the possibility of eventually finding various disease syndromes attributed to this worm in American veterans. The case about to be discussed, while concerning a Korean woman temporarily residing in the United States, is of especial interest because of the rare involvement by the parasite of the anterior abdominal wall, so that the clinical picture of acute appendicitis was simulated.

The usual life history of Paragonimus westermani is as follows: The eggs are generally passed in the sputum or feces and under suitable conditions develop into two larval stages within the fresh-water mollusk host and fresh-water crabs and crayfish hosts respectively. If infested poorly cooked or raw crabs or crayfish are ingested, the encysted larva escapes from the digested cyst wall, penetrates the upper jejunum, and gains access to the peritoneal cavity. The parasite then penetrates the diaphragm to enter the pleural space and ultimately invade the lung, where maturation to an hermaphrodite adult worm takes place.

REVIEW OF PERTINENT LITERATURE

An extensive search through the literature reveals that the organisms may be found in many unusual locations within the human body, outside its natural and more usual habitat. Musgrave[2] in 1907 studied 17 cases, in 8 of which autopsy was done. Of the latter, skin lesions were present in two out of six cases where the skin was actually examined. Two out of eight cases showed lesions in the pectoral major muscle, and in three the psoas or other muscles contained abscesses.

A case similar to that of this paper was described by Choy and Ludlow[3] in 1926. These authors described a 25-year-old Korean male with a tumefaction in the epigastric region. Ova of Paragonimus were found in the sputum and feces. At operation, a vascular lesion was found adherent to the skin and muscle fascia. This was removed and the ova of the parasite identified within the vascularized connective tissue stroma. At follow-up, no ova could be discovered again within sputum or feces. The authors stated that this was the first case with in-

volvement of the abdominal wall to be found in Korea and that they could find no similar case recorded in the Western literature. Several references were appended, however, from the Japanese literature concerning parasites or ova found outside the lung. Choy and Ludlow [4] in 1931 subsequently reported two cases of Paragonimus encysted within the omental contents of inguinal hernial sacs.

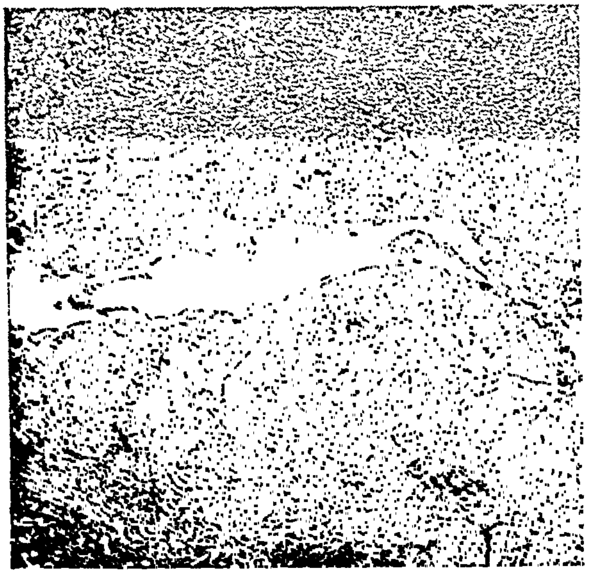

Fig. 1.—Granulomatous reaction in abdominal mass with central cystic degeneration (× 60).

In 1934 Bercovitz and Rogers [5] described the case of a 29-year-old Korean woman. She was admitted with abdominal swelling of several years' duration following a previous removal of large ovarian cysts. Following paracentesis an exploratory operation was done and the peritoneum found studded with vesicles. The mesenteric nodes were enlarged, and the clinical impression was abdominal carcinomatosis. Masses from the omentum as well as mesenteric nodes were excised for study, and these showed the ova of Paragonimus westermani. No adult worms were found.

A case involving the abdominal wall was also reported by Ko[6] in 1939. A 9-year-old Formosan boy had a mass in the left side of the abdomen that was associated with fever. Incision produced brown-yellow pus, and examination of discharges and curettings from the sinus wall showed many ova of Paragonimus. The author concluded that the origin of these ova was apparently from the migration of a fluke from the intestines to the muscles of the abdominal wall, where the eggs were subsequently laid to produce an abscess. A later check of the patient revealed cough and occasional ova within the sputum. A somewhat similar case was reported in 1947 by Pesigan and others.[7] A 28-year-old male Filipino was discharging pus through the umbilicus. At operation, a granulomatous mass was found attached to the umbilicus between the peritoneum and rectus sheath. Eggs of Paragonimus were identified in the granuloma, and serial sections failed to reveal an adult fluke.

Canizares and Celis [8] in 1951 reviewed their experiences with paragonimiasis seen at the Quezon Institute during the previous five years. They cited the rare invasion by the fluke into skin and muscle but gave no specific example. More recently Roque and others [9] discussed involvement of the skeletal muscles by the parasite, as well as lesions in the skin and subcutaneous tissues. Such involvement was presumed to be due to hematogenous dissemination.

REPORT OF A CASE

The patient, a 29-year-old Korean woman, was awakened at 1 a. m. by dull, aching pain in the right lower quadrant of the abdomen. Nausea and vomiting developed one-half hour later. This episode had been preceded the night before by localized myalgia. The pain had lessened somewhat after the attack of nausea and vomiting, but direct and rebound tenderness was quite marked over McBurney's area on physical examination. There were no other positive findings. History revealed infestation in Korea with Ascaris lumbricoides, but stools had become negative after medication. There was also a history of rather severe dysmenorrhea. The laboratory data showed a white blood cell count of 16,650 per cubic millimeter, with differential of 83% polymorphonuclear leukocytes, 16% lymphocytes, and 1% monocytes. The hemoglobin level was 12.4 gm. per 100 cc. The urine was essentially negative. The patient was operated on at 2:30 p. m., the day of the attack, after a diagnosis of acute appendicitis had been made.

On exploration a mass approximately 4 cm. in maximal diameter was found between the peritoneum and transversalis muscle, just below the McBurney incision. The mass was poorly circumscribed, appeared to involve a portion of the muscle, and showed a central excavation that communicated with the peritoneal cavity. The appendix, cecum, and terminal ileum appeared normal. The mass as well as the appendix was excised. The patient has remained perfectly well after operation. A follow-up chest roentgenogram was normal, and the patient has been unable to produce any sputum for examination for ova. To this writing all stool specimens have shown only ova of Trichuris trichiura and Trichostrongylus orientalis.

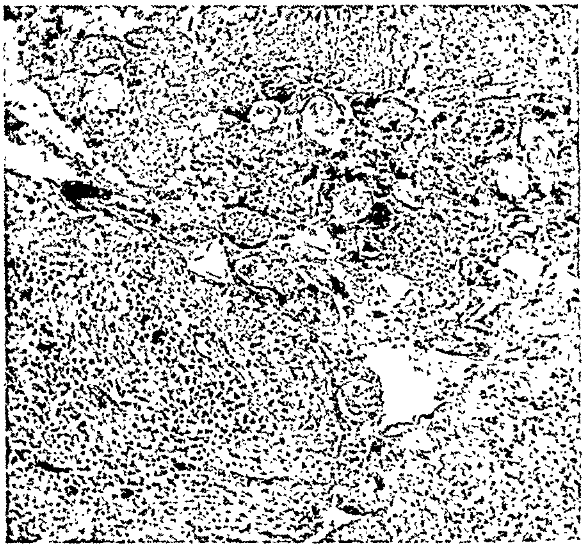

Fig. 2.—Higher magnification of right margin of figure 1 to show many well-defined ova (× 150).

PATHOLOGICAL FINDINGS

The extraperitoneal mass measured 4 by 2.5 by 1.5 cm. On cut section, gray, glistening tissue containing several cysts was revealed. These ranged from 5 to 18 mm. in diameter and had a dark red, rough lining. Light tan areas were also noted in the solid regions. The appendix was not remarkable. Microscopically the mass consisted of dense fibrous scar tissue and fat, which were the seat of multiple foreign-body-type granulomas. Some of the granulomas showed cystic degeneration, and there was a lining of epithelioid cells covered with a necrotic membrane (fig. 1). Within the cavity, as well as within the necrotic tissue and walls of the granulomas, there were numerous ova (fig. 2). The latter were generally oval and showed a thick yellow shell (fig. 3). Opercula could be identified in some of the ova, which also showed developing embryos (fig. 3). Though serial sections were made of the tissue, no adult worm was seen. The slides were shown to Dr. E. C. Nelson of the department of parasitology, who identified the ova as definitely belonging to Paragonimus westermani.

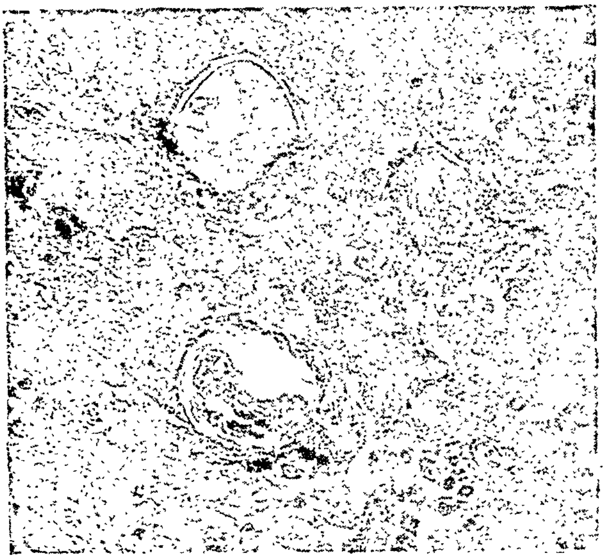

Fig. 3.—High-power view of ova to show greater detail. Note doubly contoured shell and developing larva in lower ovum (× 450).

COMMENT

The association of a simulated attack of appendicitis and paragonimiasis of the anterior abdominal wall must be a rare phenomenon. The granulomatous abscess caused by the ova of the worm was undoubtedly responsible for the localized pain in the right lower quadrant, since surgical removal has rendered the patient free of all symptoms. The systemic findings of nausea and vomiting are a little more difficult to explain but can be accounted for on the basis of absorption of toxic products caused by destruction of tissue.

The localization of the eggs of the parasite in the abdominal wall is a puzzling feature. The worm must have migrated to this site and subsequently died, since none could be found after serial sectioning of the surgically removed tissues. Whether migration took place from the intestine [6] or by way of the blood stream [9] cannot be proved, though the former method seems most probable. It is unlikely that the fluke has reached its usual site of the lung, since the patient has no cough or sputum and a chest roentgenogram is entirely negative.

SUMMARY

In a case of Paragonimus westermani infestation involving the anterior abdominal wall the patient had a simulated attack of acute appendicitis necessitating abdominal exploration. A poorly circumscribed mass was found in the anterior abdominal wall, which on removal was found to consist of a granulomatous abscess caused by the ova of Paragonimus westermani. The patient has been entirely free of symptoms after surgery, and follow-up studies of stool specimens have revealed no ova of Paragonimus.

EFFECT OF TOPICALLY APPLIED ANTIBIOTIC AGENTS ON AXILLARY ODOR

Walter B. Shelley, M.D., Ph.D.
and
Milton M. Cahn, M.D., Philadelphia

The distinctive odor of the axilla in man has long been correlated with the unique presence of apocrine sweat in this area. Recently, it has been shown that this odor is not an intrinsic property of apocrine sweat when it first appears on the skin surface.[1] It was found that the characteristic odor developed only after the normal surface bacteria had acted upon the apocrine sweat. This phenomenon of odor production by bacteria could be observed in vivo or in vitro. Also, it was discovered that the intensive use of the antibacterial hexachlorophene detergents could abolish odor for more than 18 hours in most individuals. The present study was undertaken to determine the effectiveness of topically applied antibiotic therapy on the inhibition of axillary odor.

MATERIAL

The following five preparations and control vehicles were studied as pairs, one being applied to each axilla, according to the method discussed below: (1) Myciguent cream, a cream containing 5 mg. of neomycin sulfate per gram (equivalent to 3.5 mg. neomycin base), and Myciguent cream base (control), a water-washable, nongreasy vanishing-type cream base containing methyl paraben 0.1%; (2) Mycimist, a lotion containing 5 mg. of neomycin sulfate per cubic centimeter (equivalent to 3.5 mg. neomycin base), and Mycimist base (control), a lotion containing methyl paraben 0.1%, and *n*-butyl *p*-hydroxybenzoate 0.4%; (3) Spectrocin, an ointment containing 2.5 mg. of neomycin hydrochloride per gram of neomycin base and 0.25 mg. of gramicidin per gram, and Spectrocin base (control), a non-water-absorbing ointment containing 95% mineral oil and

* Shaving, washing, or other treatment of area not permitted.
† Total number in each group: 10.
‡ Seven days after last application all subjects had strong axillary odor.

METHOD

The subjects were normal adult males who had not used axillary deodorants or antiperspirants for at least two months. In preliminary testing, all developed the typical axillary odor within 18 hours after washing the area with plain toilet soap and water.

An initial study was undertaken in the spring of 1954, to determine the effect of a single application of (1) Myciguent cream and (2) chloramphenicol cream. Twenty-five subjects were used in each of the two groups, and the antibiotic creams and placebo bases were applied immediately after washing the axilla to the point where no odor was detectable. No further applications or washings were permitted. Observations were made after one, two, four, and eight days (table 1).

In the fall of 1954 study was made of the effect of repeated daily application of each of the five antibiotic preparations and control bases to the axilla of 10 men. The first application was made immediately after the axilla had been washed free of odor. Then the antibiotics were applied liberally twice each day. Washing, shaving, and other topical applications were completely interdicted. Final readings were made two weeks later, 18 hours after the last application of the topically applied antibiotic and its paired control (table 2). Odor was simply recorded as present or absent. No attempt was made at grading or quantitation. Previous study had indicated the difficulties of measuring the degree or amount of odor, even with instrumentation. At all times the observers were kept ignorant of the treatment or procedures used by the subjects. The results are tabulated in tables 1 and 2.

COMMENT

Previous study [1] has shown micrococci (staphylococci) to probably be responsible for production of axillary odor. They are commonly the predominant flora of the normal human axilla. In this investigation neomycin in a concentration of 3.5 mg. base per gram proved to be the most effective topically applied agent. This might be expected on the basis of the work of Livingood and his associates [2] who demonstrated in vitro that neomycin is superior to all other antibiotics in regard to its effect on all strains of staphylococci. The present work adds confirmatory evidence that bacteria are the primary cause of axillary odor. The daily application of a neomycin cream or lotion was completely effective in preventing the appearance of any axillary odor in all of the subjects tested. It appears, however, that only repeated applications of neomycin in a concentration of 3.5 mg. of base per gram or more will prevent this formation of odor in the axilla.

Comment should be made regarding the effect of the control vehicles. In some subjects these bases proved effective, possibly due to their bacteriostatic action (parabens content) or to an adsorption or chemical change in the fatty acids known to be responsible for the odor.[3] This aspect of the problem was not studied. The standard commerically available aluminum deodorant preparations are highly effective and can be recommended to most individuals. However, in clinical practice Myciguent cream, Mycimist, and also Polysporin (polymyxin B sulfate, 10,000 units per gram) have proved of value for use in those few patients who do not tolerate the standard aluminum salt deodorants.

Two auxiliary studies were done to assay the effect of systemic antibacterial agents. In the first, 10 men who had received orally 2 gm. of chlortetracycline (Aureomycin) per day for three weeks were checked for axillary odor. All of them proved to have the characteristic odor. The second experiment was suggested by the observation of Kelley and Dittmer,[4] who found that milk from cows fed with menadione showed a lower rate of bacteriological souring than normal. Since apocrine sweat is a prototype of milk, it was reasoned that perhaps menadione was secreted by the apocrine as well as the mammary gland and that this could have a bacteriostatic effect on the axillary microflora with a consequent inhibition of axillary odor. Twenty men were given 50 mg. a day of menadione orally in divided dosage, and a control group of 20 was given placebo tablets. No difference in the axillary odor could be observed after one week of treatment.

SUMMARY AND CONCLUSION

Topically applied antibiotic agents have a considerable effect in preventing the appearance of normal axillary odor. The repeated application of neomycin cream or lotion (in a concentration of 3.5 mg. of base per gram of vehicle) completely inhibited the production of odor in the axilla of 20 men. This provides further evidence that axillary odor results from the action of bacteria on apocrine sweat. Clinically, the topically applied antibiotic agents provide an alternative measure for the patient who does not tolerate the standard aluminum salt deodorants.

THORACIC AORTOGRAPHY

John W. Pender, M.D.
John W. Kirklin, M.D.
and
George D. Davis, M.D., Rochester, Minn.

Translumbar aortography has proved to be a useful diagnostic procedure, but it has some limitations. One of these is the difficulty in visualizing lesions of the upper abdominal aorta. To overcome this difficulty or to visualize suspected lesions of the thoracic aorta, the needle through which the contrast medium is to be injected has been introduced through the left posterior thoracic wall to pierce the aorta above the diaphragm. The following technique has been employed satisfactorily for six patients during the past year.

MATERIALS AND METHODS

All food and drink is withheld for four to six hours before the procedure. The patient, with no premedication, is placed prone on a roentgenographic table with arms abducted and forearms flexed so that the left hand is near the face, which is turned to the left. A lead marker is placed over the spinous process of the fourth or fifth thoracic vertebra and a scout (preliminary survey) film is taken of the thorax below the lead marker and of the upper part of the abdomen, depending on the location of the suspected lesion. While the scout film is being developed, a needle is inserted in a vein in the middle third of the left forearm and, if not contraindicated, 50 to 100 mg. of meperidine hydrochloride is given slowly and cautiously. After this injection, an apparatus is attached to the needle for later administration of 2.5% solution of thiopental (Pentothal) sodium.

From observation of the wet scout film, the most advantageous site for introduction of the special aortography needle (Becton-Dickinson no. 462, LNR, 6 in., 18 gauge) is carefully selected. The site at which the thoracic aorta extends the greatest distance to the left of the midline is usually chosen. This probably will be over the interspace below the left fifth, sixth, or seventh rib and can be accurately located on the skin from the known relation to the position of the lead marker, which is visible on both skin and film. The skin and subcutaneous tissue at this site are infiltrated with about 10 cc. of 1% solution of procaine hydrochloride. All equipment having been prepared and a test dose of 3 or 4 cc. of thiopental sodium having already been given without unusual reaction, the patient is now given an additional 4 to 8 cc. of thiopental sodium, depending on his reaction to the test dose. A competent anesthetist must be responsible for the maintenance of a satisfactory airway at all times.

As soon as the patient becomes lightly anesthetized, the aortography needle is inserted perpendicularly to the skin to pass just to the left of the left lateral surface of the body of the appropriate vertebra and to pierce the thoracic aorta or the descending portion of the arch of the aorta. A sense of resistance to the passage of the needle followed by a sudden disappearance of this resistance is usually felt as the tip of the needle pierces the wall of the aorta. Spurts of bright red blood through the needle, when the stilet is removed, are evidence that the tip of the needle is in a large artery. The entire lumen of the tip of the needle must be in the lumen of the aorta at the time the contrast medium is injected in order to avoid periaortic injection. One end of a transparent plastic tubing is now attached to the hub of the aortography needle by means of a Luer-Lok adapter (Becton-Dickinson no. H/468L), and a 20 cc. syringe, filled with 19 cc. of isotonic sodium chloride solution and 1 cc. of contrast medium, is attached to the other end of the plastic tube through a Luer-Lok one-way valve (Becton-Dickinson no. L606 and LL/S1). Ten cubic centimeters of isotonic sodium chloride–medium mixture is injected and then pressure on the plunger is released to see if blood will flow back into the plastic tubing in spurts.

If no reaction to the test dose of medium occurs, a syringe containing 20 cc. of 70% sodium acetrizoate (Urokon) or 75% sodium iodomethamate (Neo-Iopax) is attached to the one-way valve in place of the isotonic sodium chloride containing syringe and all members of the team should prepare to carry out their part of the procedure at the proper time. Accurate timing is essen-

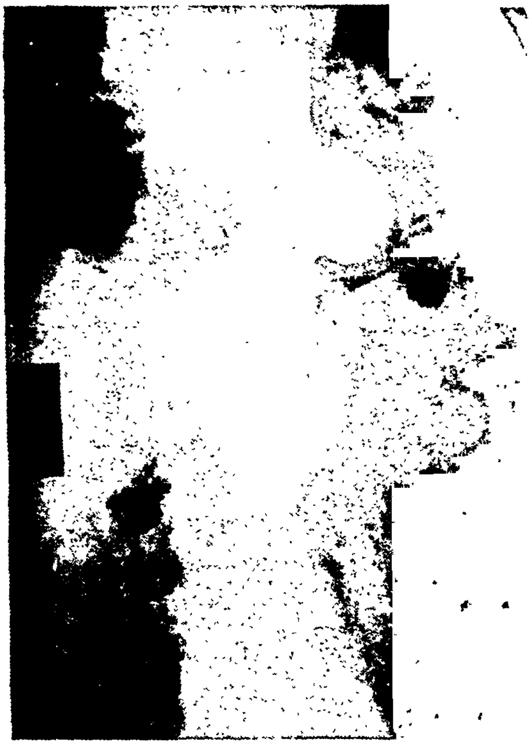
The Mayo Foundation is a part of the Graduate School of the University of Minnesota.

tial for obtaining good roentgenograms with small amounts of medium. One member of the team should give the signals, usually the one performing the injection. The anesthetist gives 4 to 8 cc. of thiopental sodium and, as soon as this takes effect, the 20 cc. of medium is injected in two to three seconds. Just before the last of the contrast medium is injected, the roentgenogram is taken, using an exposure time of 0.1 second. All needles should be left in place until the wet film can be studied for the information desired. If necessary, a second injection of medium and a second aortogram may be made.

COMMENT

By means of thoracic aortography in these six patients the following diagnoses were made: two aneurysms of the thoracic aorta (see figure) associated with fusiform dilatation of the abdominal aorta, one aneurysm of the hepatic artery, one arteriovenous fistula between right renal artery and vein, and two normal aortas for which abdominal exploration had been recommended after the clinical diagnosis of aneurysm of the proximal part of the abdominal aorta. In spite of no complications having occurred in these patients, thoracic aortography is not recommended as a routine procedure, but we believe it is a valuable diagnostic aid for special problems. Pneumothorax and hemorrhage from puncture of the aorta or intercostal arteries were carefully looked for after each of these procedures, but none occurred.



Thoracic aortogram showing two aneurysms of distal thoracic aorta.

CONCLUSIONS

Transthoracic aortography is a valuable aid in diagnosing lesions of the lower thoracic aorta and the upper abdominal aorta and its branches.

DIAGNOSTIC PROBLEMS

PRESENTATION OF CASE

James M. Kidd, M.D., Chicago

In February, 1948, a 5-year-old girl had measles followed by chickenpox. During this time she began to have attacks of abdominal pain associated with vomiting. At times the vomitus was said to contain small blood clots. These episodes lasted two or three days and were infrequent. In August they became more severe and more frequent, occurring every week and associated with a temperature of 102 to 103 F (38.9 to 39.4 C). She was able to go to school between attacks, but her teachers stated that she seemed to be listless. In November, December, and January she received combined diphtheria, pertussis, and tetanus immunization. She was sick after each dose. On Jan. 27, her mother noted a yellow tint to her scleras, and within a week her skin was definitely jaundiced. Associated with the onset of visible icterus was the presence of dark urine and white stools. On a fat-free diet the jaundice lessened but did not entirely clear. In the next two months she had two similar episodes in which the jaundice became more intense and was associated with abdominal pains and white stools. On April 22 she was admitted to the hospital.

Physical Examination.—On admission the patient was moderately jaundiced and had an enlarged, firm, tender liver, whose edge extended two fingerbreadths below the right costal margin. The spleen was not palpable, and no lymphadenopathy was present.

Laboratory Findings.—Icteric index was 91 units; van den Bergh gave strong direct and indirect reactions; total protein level was 9.6 gm. per 100 cc.; albumin level was 4 gm. per 100 cc.; globulin level was 5.6 gm. per 100 cc.; cephalin flocculation test was 4+; cholesterol level was 200 mg. per 100 cc.; cholesterol esters, 70 mg. per 100 cc.; urine, 4+ bile and urobilinogen 0.7 mg. per 100 cc. on a single voided specimen; stool tests were negative for bile and urobilinogen was 2+; and blood cultures were negative.

Course.—The patient remained at bed rest for three weeks and received a high-protein, high-carbohydrate, high-vitamin diet. Her jaundice lessened, the icteric index decreasing to 62. Her stools remained pale but not completely acholic. She was sent home on May 12. Following discharge she felt generally better, but the icterus did not lessen and a history of intermittent light and dark stools was obtained. The urine was persistently dark and always contained bile, and the liver remained enlarged. Her icteric index on June 18 was 143 units and on Aug. 15 was 123 units. She was readmitted at this time, and a liver biopsy showed disruption of liver cell cords. The liver cells were large, swollen, and granular, and many cells contained four to eight nuclei. The laboratory findings were essentially the same as those found three months earlier.

From the Otho S. A. Sprague Memorial Laboratory, Children's Memorial Hospital.

In the next two years she was followed in the clinic, during which time she had infrequent attacks of asthma. Jaundice, to some extent, was always present, and her liver remained firm and enlarged. On Nov. 19, 1951, this child, then 9 years old, was again admitted to the hospital. She appeared critically ill and complained of abdominal pain of sudden onset and diarrhea of one day's duration. A roentgenogram of the abdomen revealed no evidence of intestinal obstruction but did reveal an oval density in the right upper abdominal quadrant. There was a "ground glass" appearance to the rest of the abdomen. The patient was still moderately icteric. Her liver extended to the level of the umbilicus, and a fluid wave was demonstrable by abdominal palpation. An abdominal paracentesis was performed, and 600 cc. of sterile bile-containing fluid with 16.5 mg. of protein per 100 cc. was removed. She was discharged after four weeks improved and was readmitted on Feb. 7, 1952, with a history of low-grade fever and severe pain in the right side of the abdomen associated with anorexia of six weeks' duration and a more constant low-grade fever of 12 days' duration. On admission the liver was palpable in the epigastrium but not below the right costal margin. A firm spleen was felt five fingerbreadths below the left costal margin. The skin was clear and nonicteric. The abdominal pain disappeared soon after admission, and after an intravenous pyelogram, which revealed no abnormality, the child was discharged on the sixth day.

* Strong immediate direct and indirect reaction.
† Biphasic moderately delayed direct and indirect reaction.

She was readmitted on March 6, 1954. She was then 11 years old and for the past 18 months had been permitted fairly normal activity. Except for an occasional feeling of fatigue she felt generally well. For three weeks prior to admission she had noted blood in her urine. For two weeks previously she had rectal bleeding. Bleeding from the gums of two days' duration was also noted. Physical examination revealed her liver to be enlarged to two fingerbreadths and her spleen to three fingerbreadths below the costal margin, both being firm to palpation. Her skin was pale but not icteric. She exhibited palmar erythema, skin atrophy, multiple telangiectasia, and several spider angiomas. A complete genitourinary study revealed no source of bleeding. Fluoroscopy of the esophagus failed to demonstrate any varices. A cholecystogram revealed poor visualization of the gallbladder about the previously noted opacity, which has increased somewhat in size. The patient's prothrombin time was slightly increased. A sigmoidoscopic examination added no further information. The urine became free of blood, and she was discharged.

She returned to the hospital in May, 1954, and a contracted, deformed gallbladder, containing no bile but two moderate-sized pigmented stones, was removed. The liver was described as being small, firm, and nodular. A biopsy specimen was taken, and sections revealed prominent perilobular fibrosis, round cell infiltration, and proliferation of bile ducts. The patient's postoperative course was unremarkable, and she was discharged on the 12th day. In November she was readmitted, complaining of progressive abdominal swelling of one month's duration and swelling of the feet for two days prior to admission. Physical examination revealed mild scleral icterus, hepatosplenomegaly, ascites, and peripheral pitting edema of the lower extremities. Blood studies revealed further reversal of the albumin-globulin ratio and elevation of serum bilirubin level, predominantly direct. On bed rest her edema decreased and she became more comfortable. She was discharged on the 10th day. Her edema persisted, and when she was seen at the clinic from time to time her urine contained albumin and occasionally erythrocytes. On May 31, 1955, she suddenly became confused and unresponsive and was admitted to the hospital for the eighth time. Physical examination revealed peripheral edema, ascites, and dehydration. In spite of the judicious use of intravenously administered fluids and supportive therapy she failed to respond. She died within 24 hours of admission (see *table*).

ANATOMIC DIAGNOSIS

The body was that of a slightly icteric but relatively well-nourished and well-developed child of 12 years; 100 cc. of clear, straw-colored fluid was found in the peritoneal cavity. A few adhesions extended from the duodenum to the scarred bed of the previously removed gallbladder. The liver weighed 700 gm. (average normal 1,000 gm.) and presented both a nodular and finely granular surface. The cut surface was dark yellow-brown and lobulated. Glisson's capsule was greatly thickened.

The spleen was enlarged, weighing 850 gm. (average normal, 100 gm.). On cut section a moist purple surface was exposed. The heart was grossly normal. The lungs were diffusely congested. The lower third of the esophagus presented a few faintly visible varices. Microscopic sections of the liver revealed a thickened capsule from which connective tissue septums of variable width extended inward to form an irregular anastomosing network giving a pseudolobular pattern to the hepatic parenchyma. The lobules varied greatly in size. The broad connective tissue bands were characterized by proliferation of bile ducts and capillaries and the presence of either localized or diffuse aggregations of chronic inflammatory cells. Rare areas showed almost complete replacement of hepatic cells by a more dense fibroblastic connective tissue with similar or even more pronounced proliferation of bile duct epithelium. Most of the circumscribed islands of liver tissue revealed a widespread parenchymal degeneration as evidenced by vacuolization, cytoplasmic smudging, and loss of nuclear detail. The spleen presented a picture of intense congestion and subcapsular fibrosis. Varices were found in sections through the lower part of the esophagus. A widespread, pronounced congestion of the lungs was present.

COMMENT

Joseph D. Boggs, M.D., Chicago

This case well illustrates the prolonged course and eventually fatal termination of cirrhosis in childhood. The early phase of the disease in this child, the progression of changes seen in the liver biopsy specimens, and certain of the laboratory examinations are worthy of special note. From the beginning of the child's illness until the time of the first appearance of jaundice, 11 months elapsed. During this period the patient had bouts of abdominal pain, vomiting, and fever without any indication of clinical jaundice. Although the beginning of illness appeared to coincide with measles and chickenpox, prolonged vomiting productive of blood is exceedingly rare following either of these diseases, particularly when associated with abdominal pain. One is therefore led to the possibility of a long period of liver disease before the appearance of overt symptoms readily suggesting hepatic damage. The patient received hypodermic injections about 60 days before the development of jaundice. The possibility of a chance inoculation with hepatitis virus exists, for this incubation period is well within that for homologous serum hepatitis. Hepatitis without jaundice is well known. Stokes,[1] working with human volunteers; Denber [2]; Capps [3]; and others have reported such cases. If changes as seen in the first liver biopsy specimen here reported represent a viral hepatitis as reported by some, the early stage of this child's disease may represent a subacute case of hepatitis. Several writers have emphasized the prominence of abdominal pain and vomiting in conjunction with the anicteric form of hepatitis.[4] The liver should not be overlooked as the possible source of disease in the nonjaundiced child with prolonged abdominal pain or vomiting.

The liver biopsy specimens are of particular interest, in that they demonstrate a progression of liver changes. The first specimen in this case was taken 18 months after the onset of vomiting and abdominal pain and 10 months after onset of jaundice. In this specimen cirrhosis was not present, but instead the liver cells were described as swollen, granular, and multinucleated. These changes are not those seen in the early stages of the development of cirrhosis in adults but have frequently been reported in children. Gellis,[5] Craig,[6] Schwartz,[7] and others have described the formation of giant cells in infants and a hepatitis of viral origin has been suggested as a causative factor.[6] In a number of such patients reported by Gellis [5] and exhibiting identical liver changes early in the disease, cirrhosis developed later in childhood. It would appear that the early changes seen here represent a stage of rapid hepatic regeneration with amitotic division of the proliferating cells, producing so-called liver giant cells. Craig and Landing,[6] describing the changes seen in infantile as opposed to adult hepatitis, suggested a difference in blood supply and infantile liver resistance to necrosis as a possible explanation for the difference. Also to be considered is the inherently greater cellular capacity for regeneration in liver cells of children. The second liver biopsy specimen, following by nine months the first, presented different findings, the liver having developed a well-advanced cirrhosis. The liver at autopsy revealed a cirrhosis not appreciably far-progressed beyond that seen in the second biopsy specimen.

Laboratory findings at each hospital admission revealed abnormal thymol turbidity and cephalin cholesterol flocculation and increased 1 and 30 minute van den Bergh readings. Although acute infections may produce transitory changes in liver function, these changes are not as prolonged or as marked as those noted here. Hepatitis virus most frequently produces these changes. The consistently high total protein with an absolute increase of the globulin is noted to have developed in this patient before the development of cirrhosis. This change had occurred concomitant with the period of "giant cell" hepatitis. Although measurements are not given here of specific protein fractions, a rise of the gamma and beta globulin fractions in the serum of patients with hepatitis is generally recognized. Although much circumstantial evidence suggests that hepatitis virus exists in children such as this one, with later development of cirrhosis, all of the story has not been told. The possibility of viral infectious agents other than those producing infectious hepatitis or homologous serum hepatitis must be entertained. Hepatitis in children is not uncommon, nor is cirrhosis an oddity in the wards of a children's hospital. Little is known regarding the epidemiology or etiology.

CORPORATE GIVING TO HOSPITALS

Added evidence of the disappearance of the soulless corporation is the rather liberal support given by many companies to nonprofit, tax-exempt hospitals. The facts that the gifts are deductible from the corporate earnings and that the company must justify the expenditure to the shareholders by showing that its employees benefit by having the hospital in the community do not alter this view. Because most companies now recognize a responsibility to the community in which they operate and support local hospitals with gifts of money, equipment, or services such as electric power, the National Better Business Bureau conducted a survey to determine (1) what criteria corporations use in deciding whether to support a given hospital and (2) how they decide how much to give.[1] Although the maintenance and operation of hospitals has become one of the country's 10 top industries, the nonprofit hospitals have never been completely self-supporting. In 1954 the average cost to these hospitals of patient care per patient per day was $22.78. The patients paid directly or through their insurance an average of only $21.07, leaving a deficit of $1.71 per patient per day. This deficit must be made up through gifts large and small, and much of it now comes from business organizations. The exact amount cannot be determined, because some corporate contributions to community funds include hospitals along with other charities and contributions to medical schools are applied in part to research and teaching hospitals. Many firms contribute to hospitals substantially but indirectly by paying a certain proportion of the hospital insurance carried by their employees.

According to the survey, 20% of the companies participating had no firm policy governing their giving but 56% based their giving on the extent to which the hospital was in a position to benefit their employees. Other useful criteria applied by some companies included (1) proof that the hospital needed funds to supplement their receipts; (2) proof that the hospital served the community as a whole without imposing racial, religious, or other restrictions on the patients; (3) proof of efficient operation with a view to eventually becoming self-supporting; and (4) proof of acceptance by the Joint Commission on Accreditation of Hospitals. Determination of the amount of their contribution was based on such factors as so much per employee, the number of bed-days of care furnished to employees in the preceding year, the total amount of individual contributions made by the employees, a percentage of the total amount of the drive, a percentage of the company's total allotment for philanthropies, recommendations of local management, and the size of the contributions made by other companies in the area coupled with relative size and importance of the company in the community. More often than not a combination of these considerations entered into the determination of the amount to be given. Some companies used a formula based on the number of their employees, the average size of family per employee, the population of the area served, and the amount the hospital sought to raise. Many participants believed however that a formula, if used, should not be too rigid but should rather serve as a guide.

The survey was strictly a fact-finding device and was not meant to establish any policies, but rather, by presenting various approaches to the two problems presented (whether to give and, if so, how much), to stimulate those in management to think of the problems in terms of their own special situation. Having done so, it is hoped that they will not only continue to give but to give wisely.

EDUCATION OF PHYSICIANS FOR INDUSTRY

In early December, the National Fund for Medical Education with the co-sponsorship of the Council on Medical Education and Hospitals and the Council on Industrial Health of the American Medical Association, as well as the Association of American Medical Colleges, conducted a conference on the Education of Physicians for Industry at the Mellen Institute in Pittsburgh. Medical educators, occupational physicians, and industrialists engaged in three days of panel discussions and symposiums designed to evaluate the problems and growing needs in the important field of occupational medicine.

The education of physicians for industry was discussed from undergraduate, graduate, and postgraduate aspects. It was generally agreed that occupational medicine is that branch of medicine that deals with the relationships of man to his occupation for the purpose of the prevention of disease and injury and the promotion of optimal health, productivity, and social adjustment. Due recognition was given to the fact that American industry is the backbone of modern American civilization and is perhaps the greatest reason for our nation's preeminence in world affairs today. Obviously, our working force is industry's most valuable asset, and the health problems of all engaged in industry are of vital concern to continued national progress.

One of the important problems confronting medical educators and occupational physicians is the necessity of creating an awareness of, and interest in, this field among teachers and students in our medical schools. This does not appear to necessitate any radical revision of undergraduate curriculums, but it does involve the introduction into undergraduate clerkships of contact with qualified industrial physicians as members of the teaching staff. Physicians engaged in this field of medical care have a genuine challenge in effectively presenting the needs of occupational medicine so that interest and awareness is aroused in their professional colleagues as well as in medical students.

---

[1] Corporate Contributions to Hospitals, New York, National Better Business Bureau, Inc., 1955.

Graduate educational opportunities in the field of occupational medicine are increasing. A sound graduate educational program has been outlined, with standards and approval mechanisms as well as training facilities carefully described. Relatively recently an American Board of Occupational Medicine has been developed as one of the special certifying units of the American Board of Preventive Medicine; this should be a further stimulus to attract qualified physicians into this field. The need of special postgraduate opportunities for physicians in private practice who give part time to certain aspects of occupational medicine constitutes another area of challenge to medical education.

The National Fund for Medical Education and its co-sponsors are to be congratulated for developing this timely and important conference on the education of physicians for industry. The intercommunication that took place did much to clarify some areas of misunderstanding and to highlight areas of mutual concern to industry and to medicine. It is to be hoped that the proceedings of this useful conference will receive widespread distribution to industry as well as to the administrators and faculties of our medical schools. The field of occupational medicine represents a dual challenge meriting wholehearted support of medical educators and industrialists.

DILATATION OF ESOPHAGUS (MEGAESOPHAGUS)

Megaesophagus is a distinct disease entity characterized by dysphagia and abnormal dilatation of the organ. The terms cardiospasm, achalasia, and megaesophagus have been used interchangeably for many years. According to Effler and Rogers,[1] this is unfortunate and adds unnecessary confusion to an already confused state of affairs. They assert that the terms cardiospasm and achalasia imply lack of relaxation of the cardiac sphincter; in other words, the circular muscle of the terminal esophagus fails to relax in coordination with the act of swallowing and dysphagia ensues. In patients in whom functional cardiospasm occurs, even the most careful radiographic and endoscopic examinations rarely demonstrate an organic pathological condition. Indeed, the most important feature of functional cardiospasm, or achalasia, is that it is not followed by progressive dilatation of the esophagus. For that matter, neither is megaesophagus the end-product of mechanical obstruction.

Megaesophagus is a distinct organic disease entity associated with obvious structural change, quite different from achalasia or functional cardiospasm. This disease occurs at all ages. Patients with megaesophagus may present severe nutritional disturbances, with profound weight loss and the appearance of frank starvation. This does not occur in functional cardiospasm. Although the etiology of megaesophagus is unknown, Effler and Rogers maintain that the disease is featured by a pathological contraction of the circular muscle in the cardiac esophagus and by proximal dilatation of the organ. The diagnosis of megaesophagus is based on the clinical history and on radiography. Dysphagia secondary to the contraction of the hypertrophic inferior constrictor muscle and food retention are the major clinical features of the disease. Radiographic findings offer a conclusive diagnosis in most cases. On the other hand, with simple cardiospasm the esophagus may be quite normal in appearance, with some delay occurring as the barium enters the stomach. In megaesophagus, the organ clearly shows dilatation and impairment or absence of normal peristalsis.

Medical therapy and dilation offer symptomatic relief in most instances of cardiospasm or achalasia. Careful distinction, however, should be made between patients with functional cardiospasm and patients who have the characteristic organic changes of megaesophagus. Attempts to relieve the tonic contraction of the cardiac sphincter and megaesophagus by means of sympathomimetic drugs, sedatives, antispasmodics, or procaine derivatives have been singularly unsuccessful. A wide variety of dilation procedures have been recommended in the treatment of megaesophagus. In selected cases, where the esophagus is not tortuous, bouginage is sometimes successful; in other instances, patients who have had repeated dilations over a prolonged period of time display transient improvement only.

Effler and Rogers recommend surgery in patients with clinical evidence of true megaesophagus in whom there are no obvious contraindications to surgery. In general, surgical intervention to correct megaesophagus has utilized both the abdominal and the transthoracic routes. Although many operative modifications have been proposed, they differ primarily in detail and conform to one of three basic approaches: (1) esophagogastroplasty, (2) linear myotomy, and (3) subtotal resection and anastomosis of the esophagogastric cardia. In 1951, Wangensteen[2] described an extensive procedure in which the terminal esophagus as well as the upper stomach are resected, with a direct anastomosis between the esophagus and the gastric remnant. In the opinion of Effler and Rogers, treatment by linear esophagomyotomy offers prompt and lasting relief of symptoms. In a group of 32 patients treated surgically, 12 were treated by esophagocardioplasty, and all but 3 required a secondary operation. The 20 patients who were treated by transthoracic linear myotomy obtained complete relief from dysphagia and food retention.

THE PRESIDENT'S PAGE

A MONTHLY MESSAGE

Many physicians have written to me and have asked why the American Medical Association is opposed to the physicians of the country being included in the Social Security program. About twice as many others have written and demanded that the A. M. A. never become a part of the Social Security "fiasco," as they call it. Between these two extremes there must be an answer to the whole problem. Let us see if we can find it. As I have traveled around the country, I have found a great deal of misinformation concerning the whole Social Security program. The men who want Social Security are the younger men, who are desirous of family protection in case they die. They are enthusiastic about the survivors' benefits. They claim that these benefits are much greater than any they can buy from the private insurance industry for the price they pay. These men are not interested in the retirement benefits that come to the man or woman at age 65, for they know they can, except in rare instances, earn more than $1,200 or $1,400 yearly long after they attain the eligible age. The older men and the younger men both are not interested in these latter benefits. Most men in both categories are amazed when I tell them that the House of Delegates of the American Medical Association has never been opposed to voluntary inclusion of physicians in the program.

Let us then look at some pertinent facts: First, Social Security was originally intended, back in the middle 1930's, to take care of the elderly worker when he was out of a job, so that the younger man could have work. It was a service that was to be supported by a tax on wages and a tax on management. Today, from an insurance angle, the tax premiums are not based on sound actuarial figures, because not one single individual who is drawing Social Security benefits has contributed or paid rates that from a strictly insurance point of view are sound actuarially. The insurance industry points out that at age 65 the life expectancy of an individual is 14 years. That means that $14,000 would have to be set aside from the premiums paid (taxes) to satisfy the demand. That also means that no one today drawing Social Security has paid in as premiums (taxes) as much as $1,000, yet they will draw an average total of $14,000 for the balance of their lives. To make it completely simple—the young man today is paying the tax premium to cover this inadequacy.

Let us look then for a moment at what has happened. Each succeeding Congress has amended the Social Security bill, adding more and more benefits, and the tax premium will be soon getting larger and larger. This is a deductible tax at the source. The last benefit added was the total disability freeze. Before the ink was dry on that one, and before anyone could find out what the effect would be on the tax premium, the House of Representatives before recess passed H. R. 7225, which reduces the age for women from 65 to 62 years, and added the provision for cash total disability payments to anyone age 50 or above. This bill passed the House without any public hearings and by a parliamentary procedure with limited floor debate. The bill is now in the Finance Committee of the Senate. We are obliged to oppose this bill because it definitely puts the physician in the middle of what could be a very dangerous situation. Carrying out the provisions of this amendment could place the whole Social Security financial program in jeopardy or up the premium taxes to such an extent that eventually the younger worker, compelled to contribute a larger and larger share of his wages, would rebel against the whole program. The American Medical Association is not opposed to Social Security. We are opposed to having the benefits increased by Congress at each session because we believe that (1) we will find we cannot afford it, (2) when dependency upon the federal government increases beyond a certain point we will automatically have the welfare state firmly established, and (3) a welfare state is state socialism, and state socialism is the first cousin of Soviet communism.

For the above reasons we are intensely interested in H. R. 7225. We will be obliged to join with many other groups and organizations that fear the destruction of free enterprise, and that believe that rich though we are we cannot afford this latter extravagance, to petition the Senate to stop, look, and listen before they pass this legislation. We would ask that this whole Social Security problem be removed from politics as such and that a thorough study of the whole problem be made by a commission appointed either by the Senate or by the President. If such a study is made, we, together with many of our friends in other walks of life, feel that the Social Security program can be made to work effectively, that it will more than accomplish the purpose for which it was originally intended, and that removed from politics it will serve a useful purpose. Is this too much to ask? Or is the need for votes so important that otherwise conservative and patriotic citizens who represent us in our legislative halls are willing to sell their own as well as our birthright for a mess of pottage?

ELMER HESS, M.D., Erie, Pa.

ORGANIZATION SECTION

WORLD MEDICAL ASSOCIATION MEETING IN VIENNA

Following is a brief abstract of the proceedings of the ninth general assembly of the World Medical Association. —ED.

The Neues Rathaus in Vienna, Austria, was the site of the ninth general assembly of the World Medical Association from Sept. 20 to 26, 1955. Delegates and alternate delegates from 35 national medical associations were present. The sessions were also attended by representatives of 16 other international organizations and 10 national organizations and by 179 members of the United States Committee, Inc., of the World Medical Association. The ninth general assembly was the first international medical group to convene in Austria since this country was freed of occupying forces.

The assembly was convened by Prof. Dr. A. Spinelli of Italy, who in his presidential address pointed out that the World Medical Association has acquired world-wide prestige, esteem, and recognition. Each year the scope of activities and the enthusiasm and responsibility of the delegates increase.

Greetings and words of welcome were heard from Dr. Theodor Korner, President of the Federal Republic of Austria; Dr. Karl Niederberger, President of the Austrian Medical Association; His Honor, the Lord Mayor of Vienna; Mr. Karl Maisel, Minister of Social Affairs; and the President of the National Board of Trade.

The ninth general assembly elected Dr. Karl Niederberger, Austria, president for 1955-1956. Dr. Niederberger assumed the chair and delivered his inaugural address (*World Medical Journal,* vol. 2, no. 6, November, 1955), pointing out that the aim of the doctors of the world must be to serve suffering humanity. Prof. Dr. L. A. Hulst, Netherlands, on the request of the president and with the approval of the council, was elected presiding officer for the business sessions.

Amendments to Constitution and Bylaws

Following the return of delegates and the adoption of the standing orders, bylaw 19, paragraph ii of the constitution and bylaws, which provides the authorization for other delegations to represent member associations unable to attend, was adopted for the duration of the session.

Article 18 of the bylaws was amended to provide for the appointment of a presiding officer for the business sessions of the general assembly if the president so desires. Article 32 of the bylaws was amended to provide the appointment of a group to administer the affairs of the association in the event that financial or other emergency situations made it impossible for the council to be convened as a whole.

Applications for Membership

Membership in the association was granted to the following national medical associations:

Medical Confederation of Morocco
(Confédération des Syndicats Médicaux du Maroc)
Vatican Medical Association
(Associazione Medica Dello Vaticano)
Medical Federation of Venezuela
(Federación Médica Venezolana)

Report of the Council

Dr. Dag Knutson, Sweden, chairman of the council, presented the annual report of the council to the general assembly, which approved the following council resolutions. 1. Sincere appreciation was extended to each member association that had voluntarily increased its subscription rate to one swiss franc per member per year. 2. The council appointments and tentative program for the World Medical Association committee on occupational health services were approved. 3. The International Council of Nurses was granted permission to use the name of the World Medical Association on its health report form. 4. National medical associations in countries that have not yet ratified the 1949 Red Cross Geneva Convention were urged to recommend to their governments that this ratification be facilitated. 5. The association endorsed a resolution adopted by the International Society of Clinical Pathologists recommending that a licensed doctor of medicine be the effective head of all laboratories devoted to the diagnosis, treatment and prophylaxis of human disease. 6. The first sentence of the International Code of Medical Ethics as adopted by the assembly in 1949 was amended to read "A doctor must always maintain the highest standards of professional conduct toward both the individual and society." The assembly devoted considerable time to discussing new projects that might be undertaken. These included assistance to underdeveloped countries and national medical associations, visiting teams of experts, and regional meetings.

Reports of Secretaries

Asia.—Dr. S. C. Sen, India, secretary for Asia, reported that the government of India was in the process of implementing its medical benefit system under social security and that the shortage of well-qualified doctors to participate in the plan was creating critical problems in medical education, with the government considering the use of doctors from homeopathic and indigenous education systems for servicing its program.

Australasia.—In the absence of Dr. J. G. Hunter, secretary for Australasia, Dr. L. R. Mallen, Australia, presented a statistical report on the Australian national health service, which is under the direction of the Minister of Health who consults the medical profession at the planning level and accepts the recommendations of the profession in implementing the program.

Europe.—Dr. Paul Cibrie, France, secretary for Europe, informed the assembly that the most urgent problem in his area was the establishment of the proper relationship between the medical profession and the social security organizations. A regional meeting is planned for the purpose of comparing the status of the doctors in the systems now operating in the various countries. He reported that the results of the first world conference on medical education could be seen slowly affecting the medical schools in Europe and, finally, that the European doctor suffered economic hardship from a lack of understanding of the excessive costs connected with medical equipment and professional expense, which are not deductible under current income tax assessments.

Latin America.—Dr. Hector Rodriguez, Chile, secretary for Latin America, stressed the urgent need in his area for assistance in developing well organized efficient medical associations competent to assist in raising the standards of medical care and medical education.

Medical Education Committee

Sir Lionel Whitby, chairman of the medical education committee, reported that progress was being made on the plans for the second world conference on medical education scheduled in the United States in 1959. Studies of the proceedings of the first conference from member associations are beginning to be received and are proving helpful in planning the next conference. The topic "Postgraduate Medical Education" was recommended as the theme of the second world conference and approved by the assembly. The World Health Organization and the International Association of Universities will assist in sponsoring the program.

Miscellaneous Business Committee

Dr. Otto Rasmussen, Denmark, chairman of the miscellaneous business committee, presented a progress report on its investigation of establishing a central repository for medical credentials. Investigation is now in progress to establish legality of various forms of the original record and means of identification of the individual with his record. Continued study is also being made of promoting closer cooperation between the medical profession and the daily press.

International Liaison Committee

Dr. Jean Maystre, Switzerland, chairman of the international liaison committee, reported that meetings had been held between representatives of the World Medical Association; International Committee of the Red Cross; International Committee on Military Medicine and Pharmacy; and the World Health Organization for the purpose of discussing international medical law. The problem is an extensive one that will require investigation in various fields and must be studied comprehensively. In addition the committee was continuing its activity to find and establish legal recognition of an emblem for the protection of civilian doctors and medical care services during war time. Dr. P. Glorieux, Belgium, a member of the international liaison committee, pointed out that the medical profession must assume its responsibility not only in educating the people of the world relative to the provisions on the 1949 Geneva Convention but also in establishing the rights, duties, and responsibilities of the medical profession under this convention.

Planning and Finance Committee

Dr. Otto Leuch, Switzerland, treasurer and chairman of the planning and finance committee, presented the two reports together as they were interdependent. The financial reports for 1954 were accepted; the subscription rate for 1956 was set at 60 swiss centimes per member of a member association; the 1956 budget was adopted; and the subscription rates for ensuing years were set as follows: 1957—80 swiss centimes per member of member association, and 1958—1 swiss franc per member of member association. The subscription rate ceiling was abolished by the assembly and each member association was granted the option of paying its subscription rate above a definite proportion to be established by council either from its own treasury or from funds contributed by its supporting committee. Reports from the World Medical Association supporting committees in Australia, Canada, Sweden, and the United States of America were heard.

Social Security Committee

Dr. Dag Knutson, Sweden, chairman of the general assembly committee on social security, presented the committee report on the meeting of the committee with representatives of the International Social Security Association for the purpose of clarifying the meaning of the 15 conclusions on relations between social security institutions and the medical profession. The group had only completed consideration of about half of these conclusions; further meetings would be set and the results of the discussions made available to member associations as soon as feasible.

The topic of the social security discussion was a realistic approach to the economic and political aspects of social security. Dr. Knutson presented a paper entitled "Social Security in the Field of Health Care—Its Background and Prospects" (see THE JOURNAL Nov. 5, 1955, p. 1054).

Liaison Officers Reports

WHO, ILO, and ISSA.—Dr. Jean Maystre, Switzerland, liaison officer to the World Health Organization, the International Labour Organization, and the International Social Security Association, discussed activities of these organizations of interest to the medical profession. He noted particularly the program in occupational health programs under ILO, an expert committee on medical care in WHO, and the current interest of ISSA in the economic and technical problems of medical social security.

UNESCO and CIOMS.—Dr. Paul Cibrie, France, liaison officer to UNESCO and CIOMS, informed the assembly of developments in the programs of these two organizations. Of special interest to the medical profession is the intensified program under UNESCO in the field of research in cell growth and children's mental health; CIOMS continues its program to assist all types of scientific and professional organizations to organize and co-ordinate conferences.

ICMMP.—Dr. P. Glorieux, Belgium, liaison officer to the International Committee on Military Medicine and Pharmacy, reported that this organization was recommending that the student doctors during their medical course be taught treatment of wounds caused by weapons—especially atomic weapons. In addition he recommended that the national medical associations immediately establish a program for the care of the civilian population in the event of war. Such a program would require cooperation with the government and military officials and a wide education of the civilian population. It is a program that must be fully established during peace time.

Member Association Resolutions

The ninth general assembly adopted the following resolutions submitted from member associations:

A medical education exchange program for well qualified young doctors (Ecuador);

Assistance in incorporating the Association's social security principles in the nations health legislation (Thailand);

Recommendation for the complete autonomy of medical organizations and their freedom from government interference (Cuba);

Reaffirmation of the 12 principles of social security of the World Medical Association (Cuba); and

Creation of local and national centers of the World Medical Association (Pakistan).

Unfinished Business

A progress report was received on the formation of a joint committee between the World Medical Association and the International Union of Medical Press for editing publications. The council was instructed to consider the advisability of increasing the registration fee at general assemblies for those who were not members of official delegations.

Scientific Session

Prof. Dr. J. Bock of Austria presided over the scientific session. The following papers were heard and discussed:

Viennese Medical Teaching of Interest in Foreign Countries
Prof. Dr. Leopold Schonbauer, director of the I University Surgical Clinic

Practical Problems in Rheumatology and Balneology
Prof. Dr. Karl Fellinger, director of the II University Medical Clinic

The Significance of Pathogenesis in Therapy
Prof. Dr. Ernst Lauda, director of the I University Medical Clinic

Medical Editors Conference

Prof. Dr. Karl Fellinger, Austria, executive editor of *Wiener Zeitschrift für innere Medizin* presided at the conference of medical editors. The luncheon for medical editors was sponsored by Mr. Milton Lasdon of the Nepera Chemical Company, Yonkers, N. Y. The papers heard and discussed were:

The Scientific Medical Press in Germany
Dr. med. Walter von Brunn, editor, *Deutsche medizinische Wochenschrift*

The Scientific Medical Press in Austria
Dr. Braunsteiner, editor, *Innere Medizin*

The Professional-Political Press in Germany
Dr. med. Ernst Fromm, editor, *Hamburger Arzteblatt*

The Professional Medical Press in Austria
Dr. E. Mazanek, executive editor, *Osterreichische Arztezeitung*

Medical Problems in the General Press in Germany
Mr. J. F. Volrad Deneke, representative of *the Central Press Agency of the German Medical Association*

Survey of the History of Medical Journalism in Austria
Dr. Gerhard Joseph, Cand. Phil.

Future Meetings

The assembly reaffirmed the selection of Havana, Cuba, as the venue of the 10th general assembly, Oct. 9-15, 1956. Turkey was selected as the venue of the 11th general assembly, September, 1957.

Election

President-Elect.—Dr. Augusto Fernandez Conde, Cuba, was unanimously elected president-elect for the year 1955-1956.

Council Vacancies.—The following persons were elected to council for the ensuing three years: Dr. L. A. Hulst (Netherlands); Dr. Dag Knutson (Sweden); Sir Lionel Whitby (Great Britain).

THE JOURNAL INDEX

The index to volume 159 of The Journal will appear in the issue for Jan. 14, 1956. Extra copies of the index will be available free of charge for those who wish to bind The Journal without mutilating the index number. Address requests to the Order Department, American Medical Association, 535 N. Dearborn St., Chicago 10, Ill.

HONORED BY SCHOOL HEALTH GROUP

Fred V. Hein, Ph.D., consultant on health and fitness in the A. M. A. Bureau of Health Education, was honored recently when he was named president-elect of the American School Health Association. Dr. Hein, who holds degrees in health and physical education, was elected at the association's meeting in Kansas City. During the past year, he has served as vice-president in charge of the convention program. Before joining the A. M. A. staff 10 years ago, Dr. Hein served as supervisor of health and physical education in Oshkosh, Wis., public schools.

PROCEEDINGS OF THE BOSTON CLINICAL MEETING

ABSTRACT OF PROCEEDINGS OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION AT THE CLINICAL MEETING IN BOSTON, NOV. 29-DEC. 2, 1955

(Continued from page 1663)

Report of Judicial Council

Dr. Homer L. Pearson, Chairman, presented the report of the Judicial Council (see THE JOURNAL, Oct. 29, 1955, pages 926-927), which was referred to the Reference Committee on Miscellaneous Business.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, read the following report, which was adopted:

Report of the Judicial Council: Your reference committee considered the report of the Judicial Council and recommends the adoption of this report. Your committee desires to stress particularly the concept of the Council that "the principles of Medical Ethics are uniform in application and universal in their acceptance." Your committee desires to commend the Council's conclusion that state associations have the right to supervise the actions of their component societies and that if the right of appeal to the state association is granted it must be presumed that the state has the right to act on the appeal as its judgment dictates. The committee desires also to stress with the Council that matters of discipline are matters for local resolution.

Likewise, the committee desires to call to the attention of the House the conclusion of the Council that "the Principles of Medical Ethics of the Association proscribe as unethical all voluntarily associated activities with cultists."

Supplementary Report of Judicial Council

Dr. Homer L. Pearson, Chairman, presented the following supplementary report of the Judicial Council, which was referred to the Reference Committee on Miscellaneous Business.

Medical ethics are basically the same as ethics for any other homologous group of people working together in a common cause. They differ only in specialized particulars concerned with the service or activity which may be unique to a particular group and of little or no concern to another. Ethics are principles. They represent generations of experience by trial and error. As such, they are blueprints for the practices and behavior of the individuals who make up the group. They distill the best of the past, sustain the needs of the present, and point to the possibilities for improvement of the future. The Golden Rule is the solid core of all ethics.

Like the Golden Rule, the root principle of ethics cannot change. Interpretation and application inevitably vary to a greater or lesser degree from period to period in history. Variations come from special situations and changes of circumstance. Even when they occur after prolonged and careful consideration by adequate numbers representative of the group, they are dangerous. When forced by a powerful minority within or without a group or when selfishly motivated, variations may become extreme and basic principles distorted or forgotten altogether. In effect the old pattern is rendered completely unrecognizable, and a totally new one replaces it. All past experience is discarded, and the new plan is expected to bear its load without any certain foundations or supports. No wonder the work that results is often unsound and the structure erected collapses, destroying many innocents along with the foolish planners and builders. The only safe rule, apparently, is this: If a majority of the group agrees to change certain traditional interpretations and promulgate a new plan or rule of application in order to adapt to a real and permanent change in society or environment, it may and should very definitely do so, *provided* the alteration does not extend the structure dangerously beyond the supporting foundation of essential basic principles.

This is the age of ballyhoo. The so-called "allied commercial organizations" who make apparatus and the new "physik" have fallen under the spell and utter strange and often incomprehensible claims for their products. It's not surprising, then, that many physicians seriously question the wisdom of abiding by old-fashioned rules for the preservation of dignity and rigid honesty. These virtues wax and wane in popularity. Now they are at a rather low ebb throughout the world. We of the medical profession are told we should try to foster and certainly participate in a moral and religious rededication. If medicine wishes to provide its expected share in leadership at this important period in our history, we should be slow to change our present rules for individual conduct and behavior. Liberalization at this time may well be misinterpreted as capitulation. The advantages of more liberal interpretation on scores of thorny points are many, and they tempt us mightily. At times it seems we are engaged in a tough fight with one good arm tied behind us by our own foolish choice. We do have a most extraordinary birthright; however, if you look closely some of those immediate advantages which might be gained look a bit like pottage! Pottage may be very tempting to a hungry Esau, so let's be sure what we're trading for!

The Judicial Council views with some misgivings the trend in recent years to amend, to modify, to clarify, to reword, the Principles of Medical Ethics. These principles have been handed down to us through the years and are our birthright. Principles do not change; rules of conduct and laws may change, but principles do not. We pride ourselves in having such high ideals. The opening sentence of our principles of ethics reads: "The prime object of the medical profession is to render service to humanity; reward or financial gain is a subordinate consideration." That is a principle. It is not the desire of anyone to change it, but there are times when we wonder whether "reward or financial gain is a subordinate consideration." Birthrights are hard to come by, but their selling price is sometimes very cheap—sometimes the price is a meatless stew.

Recently this House by a large majority vote resolved to change our Principles of Medical Ethics so that it would not be unethical to own a drugstore or sell drugs and appliances "as long as there is no exploitation of the patient." Whether this is right or wrong is not for us to say. But the question arises: Where does profit end and exploitation begin? One of our principles reads: "The ethical physician, engaged in the practice of medicine, limits the sources of his income received from professional activities to services rendered the patient." Which is the undefiled heritage and which is the pottage?

There have been a number of resolutions introduced in this House concerning the division of fees. This Council was asked to determine how insurance payments could be made so that each man could get his pro-rated share. This we tried to do, but our principle is that the division of fees under any guise is unethical. Consider the matter of birthright. Consider the price of a meatless stew.

We hear a great deal these days about security. Every man must have a measure of security or he cannot survive. Let us be sure, then, just where our security lies—in the pot with the meatless stew or in a heritage undefiled. Does our security rest in the small advantages of these "extras" we have been considering or in a birthright of confidence? Does even financial advantage rest at last in the "extras" or in our heritage from honorable professional forebears? Can we deal lightly, can we afford to deal lightly, can we risk our credit to deal lightly with this bequest of confidence now reposed in us, not more as scientists than as men? Where is our security? "The prime object of the medical profession is to render service to humanity. . . ." Is this outmoded, empty phrasing or is it our birthright? "Reward or financial gain is a subordinate consideration." Is this "poppycock" or principle, a slogan or an integral part of our real security?

Invert these principles and what shall we gain—security or a mess of pottage? In the decisions of this House rests the case.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, read the following report, which was adopted:

Supplementary Report of Judicial Council: Your reference committee studied with pleasure the beautifully worded supplementary report of the Judicial Council presented by its chairman, Dr. Homer L. Pearson, and it supports the viewpoints that "The prime object of the medical profession is to render service to humanity; reward or financial gain is a subordinate consideration"; and that "our principle is that the division of fees under any guise is unethical."

Your committee desires further to support Dr. Pearson's conclusion in discussion before the reference committee that "there are few instances in which it is necessary to change principles in a short period of time." The committee therefore favors a plan which would foster the procedure of requiring that all resolutions dealing with changes in the Principles of Medical Ethics shall be considered over a period between sessions of the House before final adoption. The Speaker of the House has given your committee the interpretation that a "session" is one concurrent group of meetings which may last one, two, three or more days. Thus, the House customarily holds two sessions each year; one an annual session and one an interim or clinical session.

Your committee recommends the adoption of the supplementary report of the Judicial Council.

Report of Council on Medical Education and Hospitals

Dr. H. G. Weiskotten, Chairman, presented the report of the Council on Medical Education and Hospitals (see THE JOURNAL, Oct. 29, 1955, pages 927-935), which was referred to the Reference Committee on Medical Education and Hospitals.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George M. Fister, Chairman, Utah, submitted the following report, which was adopted:

Report of Council on Medical Education and Hospitals: In submitting its annual report, the Council on Medical Education and Hospitals has presented the various problems referred to it by the House of Delegates and the actions which it has taken in regard to them. The Council's report includes a historical background of the various actions taken by the House of Delegates relative to the internship since 1948, and presents the various steps the Council has taken prior to preparing its revision of the "Essentials of an Approved Internship." The Council presented a summary report to the House of Delegates which was published in THE JOURNAL of the American Medical Association on May 7, 1955, and subsequently included in the Handbook of the House of Delegates for the June, 1955, meeting in Atlantic City. In preparing the revision of the Essentials, the Council has taken full cognizance of the studies made by the Ad Hoc Committee on Internships of the House of Delegates and its recommendations, together with resolutions No. 51 and 55 adopted by the House of Delegates at Atlantic City concerning the educational standards of the internship and the nature of the internship. A complete statement summarizing the revision of the "Essentials of an Approved Internship," together with the full text of the revision is included in the present report of the Council as Appendix A.

Your reference committee understands that the Council also gave careful consideration to Resolution No. 82, submitted at the Atlantic City Meeting, in regard to the exclusion of obstetrics and gynecology from a straight internship. Your reference committee heard from the representatives of several obstetric and gynecologic groups requesting the reinstatement of straight internships in obstetrics and gynecology. After thorough review of the evidence presented, your reference committee concurs with the position of the Council that in the majority of instances the best preliminary preparation whether for specialty or general practice is a rotating internship. Your reference committee understands that in the past the Council has recognized straight internships in a number of the major clinical specialties as educationally sound, and therefore the Council has agreed to continue to recognize only a straight internship in medicine, surgery, pediatrics, and pathology. Your reference committee agrees with the Council's position relative to the continued approval of these internships.

Your reference committee has studied the revised "Essentials of an Approved Internship," as presented in Appendix A of the Council's report, including the proposal regarding straight internships, and recommends their adoption.

Your reference committee noted that the Council on Medical Education and Hospitals has indicated it is interested in Resolution No. 22 on general practice submitted to the House of Delegates at the Miami Meeting in 1954, and that in the current Educational Number of THE JOURNAL, issued on Oct. 8, 1955, it has included data concerning the activities of medical schools in this phase of medical education.

Further, your committee wishes to report that the Council on Medical Education and Hospitals has been cooperating with the Council on Medical Service in the studies being made in connection with Resolution No. 28 on the policy of medical practice by tax-supported medical schools, which was submitted to the House at its Miami session in December, 1954. It notes that the Council believes that important issues of this type are not solved by "ducking them," and that it is planning to devote a morning session of its next Annual Congress on Medical Education and Licensure on Feb. 13, 1956, to a symposium, cosponsored by the Council on Medical Service, to present facts and discussion in relation to problems of this area of concern to medical schools and to the profession. The members of the House of Delegates can expect a progress report in June, 1956.

In response to Resolution No. 14 on residency training in pediatrics, introduced at the Atlantic City Meeting in June, 1955, the Council is endeavoring to expedite the approval of residencies by the residency review committees as rapidly as is consistent with sound policy.

Your reference committee reports that the Council on Medical Education and Hospitals has prepared a statement on Resolution No. 45 on postgraduate medical education and pharmaceutical and drug houses, which was submitted to the House of Delegates at its June, 1955, meeting. This statement has recently been presented to the Board of Trustees for its consideration.

Your reference committee has reviewed the "Essentials of Approved Residencies and Fellowships," as presented in revision form in Appendix B of the Council's report and recommends their adoption.

Your reference committee has reviewed the "Essentials for Approved Examining Boards in the Medical Specialties," as presented in Appendix C and recommends their adoption.

Your reference committee has reviewed the "Essentials of an Acceptable School of Physical Therapy," as presented in Appendix D and recommends their adoption.

Your reference committee has reviewed the "Essentials of an Accredited School of X-Ray Technology," as presented in Appendix E and recommends their adoption.

Your reference committee recommends that in view of the possibility that there may be changes or readjustments in the names of some of the collaborating agencies cooperating in the preparation of the essentials that the Council's staff be given authority to make such editorial changes as may be necessary in keeping with the current status of these collaborating agencies.

Your reference committee has reviewed the activities of the numerous standing and special committees of the Council that have been assigned to specific topics and that have engaged individually or in collaboration with organizations concerned with certain areas of their activities. The reference committee has also noted the active participation of the Council on Medical Education and Hospitals with numerous other organizations and activities in areas closely related with or impinging on the area of medical education. Your reference committee wishes to commend the individuals and organizations represented on these committees for their cooperation with and support of American medicine.

Your reference committee calls to your attention the activities of the Council on Medical Education and Hospitals in the conduct of surveys of medical schools in conjunction with the Association of American Medical Colleges, that the University of California at Los Angeles completed its four year organizational program and graduated its first class last June, and that next June the University of Miami will graduate its first class. We wish to call attention to the new medical schools under development at the University of Florida, Seton Hall, and Yeshiva University, and the transition of the two year schools at Mississippi, Missouri, and West Virginia into full four year medical schools.

Your committee wishes to report with interest the development of five additional residency review committees since the Council's last report to the House, including a residency review committee for general practice. There are now 16 of these committees functioning in the important area of evaluating training programs at the residency level. Your reference committee wishes to commend the committees for the work they are doing in cooperation with the Council in elevating the standards of training at the residency level.

Your reference committee desires that your attention be called to the establishment of the Internship Review Committee in 1954, which is now a permanent Council committee and which consists of members representing the American Academy of General Practice, the Association of American Medical Colleges, the Federation of State Medical Boards of the United States, the American Hospital Association, and the Council on Medical Education and Hospitals.

The National Intern Matching Program appears to be progressing satisfactorily and is functioning better each year.

Your reference committee calls your attention to the continued activities of members of the Council's field staff in cooperation with the Joint Commission on Accreditation of Hospitals. Pending completion of the special study of the Joint Commission's activities, as authorized by the House, your reference committee notes that the Council will continue to carry out its responsibilities with the Joint Commission on the basis of its present commitments.

The Council should be commended for its very comprehensive report. We realize that its length is necessary to acquaint members of the House of Delgates with its various and complex activities. Your reference committee recommends the adoption of the report of the Council on Medical Education and Hospitals in its entirety.

Report of Council on Medical Service

Dr. Joseph D. McCarthy, Chairman, presented the report of the Council on Medical Service (see The Journal, Oct. 29, 1955, pages 935-945), which was referred to the Reference Committee on Insurance and Medical Service.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

The report of the reference committee on the report of the Council on Medical Service will be found on page 1649 of the Dec. 24, 1955, issue of The Journal.

Supplementary Reports of Council on Medical Service

Dr. Joseph D. McCarthy, Chairman, presented the following supplementary reports of the Council on Medical Service, nos. 1 and 2, which were referred to the Reference Committee on Insurance and Medical Service:

1. Resolution on Policy of Medical Practice by Tax-Supported Medical Schools

During the December, 1954, session of the House of Delegates, Dr. J. P. Culpepper Jr., introduced for the Mississippi delegation a resolution on medical practice by medical schools. This resolution reads as follows:

Whereas, It is imperative that a climate of free enterprise and ethical, private professional practice prevail toward the end of providing all Americans with the best possible medical care; and

Whereas, Corporate, and tax-subsidized practice manifestly defeats these ends of service; and

Whereas, There patently exists a barrier to these ends in the device of a tax-supported medical school that is engaged in the practice of medicine in which fees are levied and collected under a policy allowing this practice to employed physicians; now therefore be it

Resolved, That the American Medical Association reaffirm its unalterable opposition to socialized and state subsidized medicine regardless of the form that it may assume; and be it further

Resolved, That the House of Delegates of the American Medical Association is of the opinion that these principles should be considered by constituent and component medical societies together with all other facts pertinent to the local situation in all controversies arising in the employment of the medical faculty by state (tax) supported medical schools and be fully considered in effecting action within the framework of this policy.

The reference committee report adopted by the House was:

Resolution No. 28 on Policy on Medical Practice by Tax-Supported Medical Schools: Your reference committee, while reaffirming the portion of the resolution regarding the unalterable opposition to socialized medicine on the part of the American Medical Association, recommends that this resolution be referred, without approval or disapproval at this time, to the Council on Medical Service, which is currently undertaking a thorough study of the various aspects of this subject.

As pointed out in the reference committee report, the Council on Medical Service through its Committee on Medical and Related Facilities, had been concerned with the general problems arising from medical practice by full-time clinical faculty members of medical schools. For some time prior to the introduction of the Mississippi resolution, this Committee had been reviewing these problems and had invited personal representatives from two areas to appear before the committee.

With the introduction of the Mississippi resolution, the Council had the choice of instructing the committee to consider the resolution itself and make recommendations relative to it, or to continue its review of the general problems concerned with medical practice by full-time clinical faculty members, including the resolution as a part of the study. With full recognition of the feeling of urgency on the part of some constituent associations, the Council requested the Committee on Medical and Related Facilities to continue its study, expand it to all facets of the problem, and make a progress report at this time. The following is a progress report on the work of this Committee submitted to the House of Delegates for its information. A complete report is planned for presentation to the June, 1956, session in Chicago.

Method of Operation.—In developing this project the Council first discussed ways and means of obtaining information with representatives of the Council on Medical Education and Hospitals and the Association of American Medical Colleges. As the result of this conference an Advisory Committee was selected, consisting of representation from these two groups, the Council on Medical Service, and the American Hospital Association. This Advisory Committee has met twice, in February and November, 1955, and is presently composed of Drs. H. B. Mulholland, Charlottesville, Va., Chairman; D. Henry Poer, Atlanta, Ga.; John B. Youmans, Nashville, Tenn.; Herman G. Weiskotten, Skaneateles, N. Y.; Victor Johnson, Rochester, Minn.; Vernon Lippard, New Haven, Conn.; Robert Moore, Pittsburgh; James M. Faulkner, Cambridge, Mass.; Edwin L. Crosby, Chicago; Sarah H. Hardwicke, Chicago; and Madison B. Brown, Philadelphia. Staff personnel are Drs. Dean Smiley and E. L. Turner, and Mr. George W. Cooley, Chicago. With the advice and assistance of this committee the staffs of the four groups met on four occasions and prepared a questionnaire to be sent to the medical schools by the Liaison Committee of the Council on Medical Education and Hospitals and the Association of American Medical Colleges.

As a second step a special questionnaire was mailed to state medical associations and county medical societies in areas where medical schools are located.

As of November 1, all but five of the 75 four-year schools, had replied. Replies also had been received on 30 schools from state medical associations and on 31 schools from county medical societies. The results of the medical school questionnaire were compiled and tabulated by the staffs and have been reviewed by the Committee on Medical and Related Facilities and the Advisory Committee. The results of the medical society questionnaire are being processed but will not be completed until more replies have been received.

In reviewing this material the Committee has tried to keep in mind the views of private medical practitioners as well as the problems and views of the medical school deans. However, it was evident that something more than a written questionnaire would be necessary to lay a firm groundwork for proper evaluation of the situation.

As a third step, then, the Committee decided to hear first hand from some of those close to this problem. Since the primary areas of present controversy seemed to be Colorado, Georgia, Mississippi, Oregon, and Washington, the Committee on Medical and Related Facilities invited representatives of these state medical associations and the deans of their state medical schools to meet with the committee in Chicago. Two of the five deans and representatives from four state associations were able to attend. The other three deans wrote indicating their desire to cooperate but stating they were unable to attend. Those attending were:

David S. Pankratz, M.D., Dean, University of Mississippi School of Medicine
Samuel P. Newman, M.D., Denver, President, Colorado State Medical Society
R. C. McGahee, M.D., Augusta, First Vice-President, Medical Association of Georgia
J. W. Chambers, M.D., LaGrange, Chairman, Council, Medical Association of Georgia
S. Lamar Bailey, M.D., Kosciusko, President, Mississippi State Medical Association
H. H. McClanahan, Jr., M.D., Columbus, Committee on Medical Education, Mississippi State Medical Association
A. O. Pitman, M.D., Hillsboro, President, Oregon State Medical Society
Russell L. Baker, M.D., Portland, Chairman, Study Committee of the University of Oregon Medical School and Affiliated Institutions
G. N. Aagaard, M.D., Dean, University of Washington School of Medicine
Cyrus W. Anderson, M.D., Denver, President, Denver Medical Society
Tom Goodwin, M.D., Augusta, Speaker, House of Delegates, Medical Association of Georgia
Steve Brown, M.D., Augusta, Member of Richmond County Medical Society
George E. Twente, M.D., Jackson, Secretary, Mississippi State Medical Association
Mr. R. B. Kennedy, Jackson, Executive Secretary, Mississippi State Medical Association
E. G. Chuinard, M.D., Portland, President-Elect, Oregon State Medical Society
Mr. Clyde C. Foley, Portland, Executive Secretary, Oregon State Medical Society and Multnomah County Medical Society

In separate sessions, the Committee heard from each group and interrogated them on their various problems and viewpoints.

The fourth step taken by the Committee was a request to the Law Department to undertake a review of the state statutes, rulings, and court decisions relating to medical school organization and operation. This is in process and will be reported to the committee at its next meeting.

A fifth step, worked out in cooperation with the Council on Medical Education and Hospitals, is to be a symposium on the program of the Annual Congress on Medical Education and Licensure in February. At that time representatives of this committee, the deans of medical schools, and private practitioners will present in open meeting the results of the study, the views and problems of the deans, and the views of private practice. Dr. George Klump, Williamsport, Pa., will be moderator, with Drs. Robert L. Novy, Detroit, and Willard A. Wright, Williston, N. D., presenting the results of the medical school and medical society questionnaires; Joseph Hinsey, Ph.D., Director, New York Hospital, Cornell Medical Center, discussing the problems as the medical school sees them; Dr. D. Henry Poer, Atlanta, Georgia, giving the medical practitioner's viewpoints; and Mr. Edwin Holman, American Medical Association Law Department, reviewing some of the legal problems, followed by discussion from the audience.

These, then, are the steps taken to date by the committee. It may be that others will be indicated and, if so, they will be undertaken. In view of the projected symposium in February and the need to await more replies of the medical societies, the committee does not wish to present any conclusions or make any recommendations at this time. It does, however, wish to review briefly some of the areas with which the Committee is concerned in this study. These are:

1. The legal and statutory limitations on medical schools relating to this problem.
2. The relationship between private practice privileges for full-time clinical faculty and the Principles of Medical Ethics.
3. The extent of and effectiveness of liaison between medical schools and the local medical profession.
4. The necessity for using private patients, with all of the doctor-patient relationship factors that exist in private practice, to maintain the diversity in clinical material necessary to adequate teaching and research programs.
5. The extent of the use of fees collected from the private patients of full-time clinical faculty members (*a*) to supplement salaries of the clinical faculty so as to attract competent physicians as teachers; (*b*) to stimulate research by the clinical faculty, the teaching fellows, and the resident physicians; (*c*) to supplement general medical school operating funds; (*d*) to supplement financing of hospital operations; (*e*) to meet or underwrite the expenses incurred by the medical school or hospital in providing facilities and services for such private patients; and (*f*) to what extent is there need for such use of private practice fees relative to (*a*) (*b*) (*c*) (*d*) and (*e*).
6. The necessity for private practice privileges to serve private physicians throughout the state who request such special services or facilities as are available in the medical school or its hospital.
7. The necessity, because of such things as the expansion of voluntary health insurance and the requirements of welfare laws, to supplement the number of indigent (teaching) patients through the use of private patients.
8. The importance of maintaining a balance between private practice privileges, where such privileges are granted, and the need for clinical material, salary supplementation, etc., as well as the effectiveness of present methods used in maintaining such a balance, including (*a*) limitation to "patients referred by physicians"; (*b*) limitation as to "amount of income"; (*c*) limitation as to "time allowed"; and (*d*) limitation as to "number of patients."
9. The present use of such terms as "absolute full-time" and "geographic full-time" faculty and possible alternative titles.

Other areas may well come to the committee's attention as the medical society replies are reviewed. In addition the suggestions of individual physicians who have knowledge of or are concerned with this problem will be welcomed and given thorough consideration.

2. Resolution on Continuing Commission on Economic Policy

The Council on Medical Service has considered Resolution No. 54 (June, 1955), which was referred to it by the House of Delegates. The resolution proposed the establishment of a continuing Commission on Economic Policy. The Council has heard an able presentation by Dr. Lewis A. Alesen, California, concerning the intent of the resolution. While the Council is in sympathy with the philosophy expressed in Resolution No. 54, it is of the opinion that the Council does not have the authority or means, which includes budget, to activate a commission of such wide scope. With this in mind the Council recommends that *this resolution be submitted to the Board of Trustees for further consideration and action.*

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, the first portion of which, dealing with supplementary report 1 of the Council on Medical Service, was adopted.

On motion duly made, seconded, and carried, supplementary report 2 of the Council on Medical Service was substituted for the second portion of the report of the reference committee, and was adopted.

Supplementary Report of Council on Medical Service No. 1: This is a progress report by the Council on the subject matter of the resolution introduced by Dr. J. P. Culpepper Jr. at the December, 1954, session of the House of Delegates. Considerable discussion ensued. *The introducer of the original resolution* emphasized that the issue involved is the tax-subsidized practice of medicine which is essentially a form of socialized medicine and a practice which if allowed to continue will ultimately result in complete socialization of the profession. The chairman of the Council, in explaining this supplementary report, emphasized the fact that this is a progress report and is not by any means a final recommendation. He further emphasized the fact that the Council on Medical Education and Hospitals and the Council on Medical Service have arranged a symposium on the program of the Annual Congress on Medical Education and Licensure to be held in Chicago in February, 1956, at which time the entire subject will be thoroughly explored by representatives of the Councils, the deans of medical schools, and private practitioners. The Council has experienced difficulty in receiving returns to its questionnaire sent to state and county medical associations on this subject. Your committee urges complete and prompt compliance.

Your committee commends the action of the Council in studying thoroughly each phase of this problem and recommends no action at this time.

Supplementary Report of the Council on Medical Service No. 2: This deals with Resolution No. 54 presented at the Atlantic City meeting in June, 1955, by the California delegation under the subject of "Continuing Commission on Economic Policy." The Council reports: "While the Council is in sympathy with the philosophy expressed in Resolution No. 54, it is of the opinion that the Council does not have the authority or means, which includes budget, to activate a commission of such wide scope. With this in mind the Council recommends that this resolution be submitted to the Board of Trustees for further consideration and action."

Because this resolution does not appear in the material in the hands of the delegates, it is quoted herewith:

> WHEREAS, Governmental encroachment in the field of medical care is proceeding at a rapidly accelerating rate notwithstanding carefully conceived and well-executed measures to prevent such encroachment; and
>
> WHEREAS, This continuous erosion of medical freedom will if unchecked seriously impair and ultimately degrade if not destroy the excellent medical care now available to the American people; and
>
> WHEREAS, It may be trite and repetitious, but nonetheless most important, to emphasize constantly that medical freedom is just one of the component parts of our traditional freedom inseparably blended with religious freedom, academic freedom, economic freedom, and social freedom, to mention just a few of our God-given rights so highly prized by our founding fathers; and
>
> WHEREAS, The effectiveness of the medical profession in protecting the health of the American people has been and is seriously weakened by the quaint, antediluvian and unrealistic ostrich-head-in-the-sand concept that medicine can continue to exist as an island of freedom in a sea of collectivism; now therefore be it
>
> *Resolved,* That there is hereby created by the House of Delegates and answerable to it a continuing Commission on Economic Policy; and be it further
>
> *Resolved,* That this commission shall consist of five members of the House appointed by the Speaker; the terms of the members of this commission shall ultimately be three years, arranged at the discretion of the Speaker in his original and subsequent appointments so that these terms shall be staggered; and be it further
>
> *Resolved,* That the purpose and function of this Commission on Economic Policy shall be to make a thorough study of the relationship of the American physician to the economic milieu in which he lives and, with the aid and advice of the Director of the Bureau of Medical Economic Research, to formulate and present for the consideration of this House a constructive economic platform for the American Medical Association.

The following report of the Reference Committee on Hygiene, Public Health, and Industrial Health was adopted by the House in June:

> *Resolution No. 54 on Continuing Commission on Economic Policy.*—Your reference committee feels that the attention of the Council on Medical Service should be drawn to this resolution since it has a commission devoted to the economics of medicine. Your committee feels that this is a well-drawn and exceptionally well-worded resolution and approves it in principle, but does not feel it is one for action by the House unless the Council on Medical Service so requests.

Your committee discussed the implications and ramifications of this proposal. The objective is to place the American Medical Association in a position of superior and unquestioned leadership in all phases of medical care by insisting that food, clothing, shelter, and every environmental factor to which our patients are subjected are of almost equal, if not entirely equal, importance with the more technical phases of diagnosis and treatment. Thus it becomes imperative that the doctor of medicine, individually and through his organizations, cultivate a thorough understanding of the economic process and take the initiative in suggesting constructive steps whereby there may be a constantly increasing amount and variety of goods and services available to every individual living within our economy at a price that individual can afford to pay and in an environment in which he is encouraged to produce to his utmost, to exchange the products of his brain and hands with his fellows, and to provide for independence of himself and his family in his later years. Your committee recommends that this resolution do pass.

Report of Council on Constitution and Bylaws

The report of the Council on Constitution and Bylaws (see THE JOURNAL, Oct. 29, 1955, pages 945-946) was referred by the Speaker to the Reference Committee on Amendments to the Constitution and Bylaws with the exception of the item on "Revision of Principles of Medical Ethics," which was referred to the Reference Committee on Miscellaneous Business.

REPORT OF REFERENCE COMMITTEE ON AMENDMENTS TO THE CONSTITUTION AND BYLAWS

Dr. Jay J. Crane, Chairman, Section on Urology, submitted the following report, which was adopted:

Your reference committee on Amendments to the Constitution and Bylaws wishes to compliment the members of the Council on Constitution and Bylaws. Drs. Louis A. Buie, Chairman, Warren W. Furey, Floyd S. Winslow, Stanley H. Osborn, B. E. Pickett Sr., Edwin S. Hamilton, Elmer Hess, George F. Lull, Ernest B. Howard, E. Vincent Askey, and Louis M. Orr, on the excellent work they have performed over the period of years giving the American Medical Association a workable and intelligent yardstick governing its diversified activities. Your committee especially wishes to praise Dr. Louis A. Buie for his tireless devotion and study while serving as a member of the Judicial Council as well as chairman of the Council on Constitution and Bylaws.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, presented the following report, which was adopted:

Revision of the Principles of Medical Ethics: Your reference committee reviewed that section of the report of the Council on Constitution and Bylaws which deals with the revision of the Principles of Medical Ethics. Your reference Committee recommends that this portion of the report of the Council be adopted.

Supplementary Report of Council on Constitution and Bylaws

Dr. B. E. Pickett Sr., Acting Chairman, read the following supplementary report, sections 1 and 5 of which were referred to the Reference Committee on Miscellaneous Business, and sections 2, 3, 4, 6, and 7 to the Reference Committee on Amendments to the Constitution and Bylaws:

This supplementary report pertains to items which are not included in the annual report of the Council on Constitution and Bylaws.

1. The Board of Trustees submitted to the Council for consideration and possible implementation a resolution made by the Commission on Medical Care Plans "that the Constitution and Bylaws be amended to provide that amendment to the Principles of Medical Ethics proposed at a session of the House of Delegates shall be held over until the next session before final action is taken, and that during this period the Judicial Council shall consider such proposed amendments and report to the House of Delegates at the session at which final action is taken."

Neither the Principles of Medical Ethics nor the Constitution and Bylaws provide for amendment to the Principles, but changes approved by a majority vote of the House of Delegates have long been recognized as valid. The members of the Council believe that changes should be made in the Principles only after most careful consideration, but they recognize that the House of Delegates should not be required to refer such changes to the Judicial Council only. The Council on Constitution and Bylaws therefore recommends that a new section be added, as a final section, to the Principles of Medical Ethics as follows:

> These Principles may be amended on approval of two-thirds of the members of the House of Delegates present and voting, provided an amendment shall not be acted on until the session following that on which it is introduced.

It is the opinion of the members of the Council on Constitution and Bylaws that the interval between the sessions of the House of Delegates will provide ample opportunity for anyone, including the Judicial Council, to give appropriate consideration to the proposed amendment.

2. The attention of the Council has been called to the fact that whereas Chapter I, Section 1, of the Bylaws provides for the exemption of Associate Members from the payment of American Medical Association membership dues, such provision is not contained in Chapter III which is devoted to the subject of dues. It is therefore recommended that Chapter III be amended by adding to Section 4 a new paragraph (F), as follows:

> (F) Associate members shall not be required to pay membership dues to the American Medical Association and shall not receive any publication of the American Medical Association except by subscription.

3. In June, 1955, the House of Delegates approved a report of the Reference Committee on Sections and Section Work which recommended that the name of the Section on Dermatology and Syphilology be changed to Section on Dermatology, and that the name of the Section on Physical Medicine and Rehabilitation be changed to Section on Physical Medicine. Therefore, the Council recommends that Chapter VII, Section 1(J) of the Bylaws be amended by deleting the words "and Syphilology," and that Chapter VII, Section 1(S) of the Bylaws be amended by deleting the words "and Rehabilitation."

4. At its meeting in June, 1955, the Council considered some matters referred to it by both the Board of Trustees and the Council on Scientific Assembly. These matters related to suggestions designed to clarify the provisions of the Bylaws governing the activities of the Scientific Assembly. Two of the suggestions were approved by this Council and subsequently by the Board of Trustees, and the following changes in the Bylaws are therefore recommended:

(A) Chapter VI, Section 1, of the Bylaws provides: "General meetings of the Scientific Assembly shall be arranged by the Board of Trustees. The general meetings shall be presided over by the President-Elect or in his absence or at his request by the Vice President or by a member of the Board of Trustees." Because of the fact that the Scientific Assembly, the Board of Trustees, and the House of Delegates all meet on the same day, it is becoming increasingly difficult for the President-Elect, Vice President or a member of the Board to preside at meetings of the Scientific Assembly. Therefore, the Council recommends that Chapter VI, Section 1, be amended by deleting the second sentence providing: "The general meetings shall be presided over by the President-Elect or in his absence or at his request by the Vice President or by a member of the Board of Trustees," and substituting therefor the sentence, "The Board of Trustees shall select the official who will preside at the general meetings of the Scientific Assembly," so that Chapter VI, Section 1, as amended will provide: "General meetings of the Scientific Assembly shall be arranged by the Board of Trustees. The Board of Trustees shall select the official who will preside at the general meetings of the Scientific Assembly."

(B) Chapter VII, Section 4, of the Bylaws provides: "The election of officers of the several sections, except the Section on Miscellaneous Topics, shall be the first order of business of the second meeting of the section at each Scientific Assembly. Only those may participate in an election who have indicated on registering the desire to affiliate with that section." Often, the second meeting of a section is a joint meeting with another section and confusion may result if an election of officers must be held at that time. Sections may make rules for the conduct of their proceedings and these rules may provide for an election of officers at some other time during the annual meeting if the first sentence of Chapter VII, Section 4 of the Bylaws were eliminated. Therefore, the Council recommends that Chapter VII, Section 4, be amended by deleting from lines 3 and 4 the words, "the first order of business of the second meeting of the section at each Scientific Assembly," and substituting therefor the words, "held during the annual meeting of the section," so that Chapter VII, Section 4, as amended will provide: "The election of officers of the several sections, except the Section on Miscellaneous Topics, shall be held during the annual meeting of the sections. Only those may participate in an election who have indicated on registering the desire to affiliate with that section."

5. In June of 1952, the House of Delegates assigned to the Council on Constitution and Bylaws the task of revising the Principles of Medical Ethics. The Council realized immediately the magnitude of the assignment, and recognized several factors which would delay its consummation. For example, a committee had been appointed by the Board of Trustees to study the osteopathic problem and later a committee was appointed by the Board to study the entire subject of ethical behavior of physicians. Obviously, the Council on Constitution and Bylaws could not complete its consideration of these subjects until the reports of these committees had become available. As you know, the reports of these committees were not made known until the last session of the House of Delegates in June of this year.

Another problem of obvious significance is the fact that, in all likelihood, there may be insufficient time during any session of the House to give appropriate consideration to a complete revision of the Principles. Therefore, the members of the Council decided to devote their attention to those principles which appeared to demand immediate consideration and to offer recommendations regarding them to the House of Delegates.

Accordingly, a Preamble was prepared which was approved by the House of Delegates in December, 1953, and during subsequent sessions of the House recommendations regarding revision of Sections 2, 4, 5, 6, 7 and 8 of Chapter I were approved.

The Council has now completed its study of the remainder of the Principles and is prepared to offer several recommendations. These proposals will require careful consideration by the members of the House of Delegates, and it is possible that sufficient time will not be available during this session to complete the task. The decision regarding this phase of the problem rests with the members of the House. Your attention is called to the fact that disagreement regarding any of the Council's proposals need not necessitate reconsideration of the entire revision.

In addition, the Council has devoted its attention to the following matters: (1) Several Principles appear to require revision, and recommendations regarding such revision have been prepared; (2) certain sections or portions of section have been found to be repetitious, and proposals regarding alteration or deletion have been prepared; (3) the members of the Council believe that Section 3 of Chapter VI is obsolete, and request that the members of the House consider the advisability of its deletion; (4) The sentiment expressed in some of the Principles which have not received attention appears to conflict with some of those which have been revised, and proposals have been prepared to correct these discrepancies; (5) An over-all editorial study has been made of the unrevised portion of the Principles, and proposals have been prepared which will correct wording without altering intent; (6) A study has been completed in which those principles which pertain to the domain of manners have been identified and the Council recommends that they be separated from the main body of the Principles of Medical Ethics. In order to accomplish this, it is proposed that the Principles be divided into two parts and that Part I be devoted to the Domain of Medical Ethics and that Part II be devoted to the Domain of Manners.

In their present form the Chapter headings are confusing and appear to serve no useful purpose. Therefore, it is recommended that they be abandoned and that a complete cross index be prepared which will provide for quick reference to subject matter and in general facilitate utilization of the Principles of Medical Ethics.

Following is the complete proposed revision of the Principles:

PROPOSED PRINCIPLES OF MEDICAL ETHICS AND PRECEPTS OF MANNERS

Preamble

These principles are intended to serve the physician as a guide to ethical conduct as he strives to accomplish his prime purpose of serving the common good and improving the health of mankind. They provide a sound basis for solution of many of the problems which arise in his relationship with patients, with other physicians, and with the public. They are not immutable laws to govern the physician, for the ethical practitioner needs no such laws; rather they are standards by which he may determine the propriety of his own conduct. Undoubtedly, interpretation of these principles by an appropriate authority will be required at times. As a rule, however, the physician who is capable, honest, decent, courteous, vigilant, and an observer of the Golden Rule, and who conducts his affairs in the light of his own conscientious interpretation of these principles, will find no difficulty in the discharge of his professional obligations.

Part One

THE DOMAIN OF MEDICAL ETHICS

Section 1.—The prime object of the medical profession is to render service to humanity; reward or financial gain is a subordinate consideration. Whoever chooses this profession assumes the obligation to conduct himself in accord with its ideals. A physician should be "an upright man, instructed in the art of healing." He must keep himself pure in character and be diligent and conscientious in caring for the sick. As was said by Hippocrates, "He should also be modest, sober, patient, prompt to do his whole duty without anxiety; pious without going so far as superstition, conducting himself with propriety in his profession and in all the actions of his life."

Section 2.—The avowed objective of the profession of medicine is the common good of mankind. Physicians faithful to the ancient tenets of this profession are ever cognizant of the fact that they are trustees of medical knowledge and skill and that they must dispense the benefits of their special attainments in medicine to all who need them. Physicians dedicate their lives to the alleviation of suffering, to the enhancement and prolongation of life, and to the destinies of humanity. They share whatever they have learned and whatever they may discover with their colleagues in every part of the globe. They recognize instinctively that the need for improvement of medical knowledge and skills is never at an end, and while they strive toward satisfaction of this need they are zealous in making available to physicians a good character who possess the desire and the ability to learn the aggregate of progress in medical education, research, and discoveries as they may exist at the time. They do not remain content to limit their activities to the care of the infirm, since they recognize also their useful rank among the vast concourse of citizens on whose shoulders the destiny of our nation rests. At the same time they will resist attempts to debase their services by diverting them to ignoble purposes. In their relationships with patients, with colleagues, and with the public, they maintain under God, as they have down the ages, the most inflexible standards of personal honor.

Section 3.—The ethical principles actuating and governing a group of clinic are exactly the same as those applicable to the individual. As a group or clinic is composed of individual physicians, each of whom, whether employer, employee or partner, is subject to the principles of ethics herein elaborated, the uniting into a business or professional organization does not relieve them either individually or as a group from the obligation they assume when entering the profession.

Section 4.—Solicitation of patients, directly or indirectly, by a physician, by groups of physicians or by institutions or organizations is unethical. This principle protects the public from the advertiser and salesman of medical care by establishing an easily discernible and generally recognized distinction between him and the ethical physician. Among unethical practices are included the not always obvious devices of furnishing or inspiring newspaper or magazine comments, concerning cases in which the physician or group or institution has been, or is, concerned. Self laudations defy the traditions and lower the moral standard of the medical profession; they are an infraction of good taste and are disapproved.

The most worthy and effective advertisement possible, even for a young physician, especially among his brother physicians, is the establishment of a well merited reputation for professional ability and fidelity. This cannot be forced, but must be the outcome of character and conduct. The publication or circulation of simple professional cards is approved in some localities but is disapproved in others. Disregard of local customs and offenses against recognized ideals are unethical.

Section 5.—Many people, literate and well educated, do not possess a special knowledge of medicine. Medical books and journals are not always easily accessible or readily understandable.

The medical profession considers it ethical for a physician to meet the request of a component or constituent medical society to write, act or speak for general readers or audiences. On the other hand, it may often happen that the representatives of popular news media are the first to perceive the adaptability of medical material for presentation to the public. In such a situation the physician may be asked to release to the public some information, exhibit, drawing or photograph. Refusal to release this material may be considered a refusal to perform a public service, yet compliance may bring the charge of self-seeking or solicitation.

An ethical physician may provide appropriate information regarding important medical and public health matters which have been discussed during open medical meetings or in technical papers which have been published, and he may reveal information regarding a patient's physical condition if the patient gives his permission, but he should seek the guidance of appropriate officials and designated spokesmen of component or constituent medical societies. Spokesmen should be empowered to give prompt and authoritative replies and a list should be issued which identifies them and discloses the manner in which they may be reached. These provisions are made with full knowledge that the primary responsibility of the physician is the welfare of his patient but proper observation of these ethical provisions by the physician concerned should protect him from any charge of self-aggrandizement.

Scientific articles written concerning hospitals, clinics or laboratories which portray clinical facts and techniques and which display appropriate illustrations may well have the commendable effect of inspiring public confidence in the procedure described. Articles should be prepared authoritatively and should utilize information supplied by the physician or physicians in charge with the sanction of appropriate associates.

When any sort of medical information is released to the public, the promise of radical cures or boasting of cures or of extraordinary skill or success is unethical.

An institution may use means, approved by the medical profession in its own locality, to inform the public of its address and the special class, if any, of patients accommodated.

Section 6.—The ethical physician, engaged in the practice of medicine, limits the sources of his income received from professional activities to services rendered the patient. Remuneration received for such services should be in the form and amount specifically announced to the patient at the time the service is rendered or in the form of a subsequent statement.

Unethical methods of inducement to refer patients are devices employed in a system of patronage and reward. They are practiced only by unethical physicians and often utilize deception and coercion. They may consist of the division of a fee collected by one physician ostensibly for services rendered by him and divided with the referring physician or physicians or of receiving the entire fee in alternate cases.

When patients are referred by one physician to another, it is unethical for either physician to offer or to receive any inducement other than the quality of professional services. Included among unethical inducements are split fees, rebates, "kickbacks," discounts, loans, favors, gifts, and emoluments with or without the knowledge of the patient. Fee splitting violates the patient's trust that his physician will not exploit his dependence upon him and invites physicians to place the desire for profit above the opportunity to render appropriate medical service.

Billing procedures which tend to induce physicians to split fees are unethical. Combined billing by physicians may jeopardize the doctor-patient relationship by limiting the opportunity for understanding of the financial arrangement between the patient and each physician. It may provide opportunity for excessive fees and may interfere with free choice of consultants, which is contrary to the highest standards of medical care.

Section 7.—A physician may patent surgical instruments, appliances, and medicines or copyright publications, methods, and procedures. The use of such patents or copyrights or the receipt of remuneration from them which retards or inhibits research or restricts the benefits derivable therefrom is unethical.

Section 8.—It is not unethical for a physician to prescribe or supply drugs, remedies, or appliances as long as there is no exploitation of the patient.

Section 9.—The acceptance of rebates on prescriptions and appliances or of commissions from those who aid in the care of patients is unethical.

Section 10.—The prescription or dispensing by a physician of secret medicines or other secret remedial agents, of which he does not know the composition, or the manufacture or promotion of their use is unethical.

Section 11.—An ethical physician will observe the laws regulating the practice of medicine and will not assist others to evade such laws.

Section 12.—A physician should not base his practice on an exclusive dogma or a sectarian system, for "sects are implacable despots; to accept their thralldom is to take away all liberty from one's action and thought."[*] A sectarian or cultist as applied to medicine is one who alleges to follow or in his practice follows a dogma, tenet or principle based on the authority of its promulgator to the exclusion of demonstration and scientific experience. All voluntary professional relationships with cultists are unethical.

Section 13.—Patience and delicacy should characterize the physician. Confidence entrusted by patients to a physician and deficiencies in the disposition or character of patients observed during medical attendance should never be revealed unless their revelations is required by law. Sometimes, however, a physician must determine whether his duty to society requires him to reveal information, obtained through confidences entrusted to him as a physician, to protect the health and welfare of the community. In such instance, the physician should act as he would desire another to act toward one of his own family in like circumstances. Before he determines his course, the physician should know the law of his community concerning privileged communications.

Section 14.—The physician should neither exaggerate nor minimize the gravity of a patient's condition. He should assure himself that the patient, his relatives or his responsible friends have such knowledge of the patient's condition as will serve the best interests of the patient and the family.

Section 15.—A physician is free to choose whom he will serve. He should, however, respond to any request for his assistance in an emergency or whenever temperate public opinion expects the service. Once having undertaken a case, the physician should not neglect the patient, nor should he withdraw from the case without giving notice to the patient, his relatives or his responsible friends in time to allow them to secure the services of another physician.

Section 16.—A physician is expected to uphold the dignity and honor of his vocation. In order that a physician may best serve his patients, he is expected to exalt the standards of his profession and to extend its sphere of usefulness.

Section 17.—For the advancement of his profession, a physician should affiliate with medical societies and contribute of his time, energy and means so that these societies may represent the ideals of the profession.

Section 18.—A physician should aid in safeguarding the profession against admittance to it of those who are deficient in moral character or education. He should expose, without fear or favor, incompetence or unethical conduct on the part of members of his profession. Such problems should be considered before appropriate committees.

Section 19.—In a case of serious illness, especially in doubtful or difficult conditions, the physician should request consultations.

Section 20.—In every consultation, the benefit to the patient is of first importance. All physicians interested in the case should be candid with the patient, a member of his family or a responsible friend.

Section 21.—All physicians concerned in consultations should be punctual. When, however, one or more of the consultants are unavoidably delayed, the one who arrives first should wait for the others for a reasonable time, after which the consultation should be considered postponed. When the consultant has come from a distance, or when for any other reason it will be difficult to meet the physician in charge at another time, or if the case is urgent, or it be the desire of the patient, his family or his responsible friends, the consultant may examine the patient and mail his written opinion, or see that it is delivered under seal to the physician in charge. Under these conditions, the consultant's conduct must be especially tactful; he must remember that he is framing an opinion without the aid of the physician who has observed the course of the disease.

Section 22.—When a patient is sent to a consultant and the physician in charge of the case cannot accompany the patient, the physician in charge should provide the consultant with a history of the case, together with the physician's opinion and outline of the treatment, or so much of this as may be of service to the consultant. As soon as possible after the consultant has seen the patient he should address the physician in charge and advise him of the results of the consultant's investigation.

Section 23.—A physician, in his relationship with a patient who is under the care of another physician, should not give hints relative to the nature and treatment of the patient's disorder; nor should a physician do anything to diminish the trust reposed by the patient in his own physician. In embarrassing situations, or whenever there seems to be a possibility of misunderstanding with a colleague, a physician should seek a personal interview with his fellow.

Section 24.—Whenever there arises between physicians a grave difference of opinion, or of interest, which cannot be promptly adjusted, the dispute should be referred for arbitration, preferably to an official body of a component society.

Section 25.—Poverty of a patient, and the obligation of physicians to attend one another and the dependent members of the families of one another, should command the gratuitous services of a physician. Institutions and organizations for mutual benefit, or for accident, sickness and life insurance, or for analogous purposes, should meet such costs as are covered by the contract under which the service is rendered.

Section 26.—A physician should not dispose of his services under conditions that make it impossible to render adequate service to his patients, except under circumstances in which the patients concerned might be deprived of immediately necessary care.

Section 27.—Contract practice as applied to medicine means the practice of medicine under an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization, political subdivision or individual, whereby partial or full medical services are provided for a group or class of individuals on the basis of a fee schedule, or for a salary or for a fixed rate per capita.

Contract practice *per se* is not unethical. Contract practice is unethical if it permits of features or conditions that are declared unethical in these Principles of Medical Ethics or if the contract or any of its provisions causes deterioration of the quality of the medical services rendered.

Section 28.—Free choice of physician is defined as that degree of freedom in choosing a physician which can be exercised under usual conditions of employment between patients and physicians. The interjection of a third party who has a valid interest, or who intervenes between the physician and the patient does not *per se* cause a contract to be unethical. A third party has a valid interest when, by law or volition, the third party assumes legal responsibility and provides for the cost of medical care and indemnity for occupational disability.

---

[*] Nicon, father of Galen.

Section 29.—A physician should not dispose of his professional attainments or services to any hospital, lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit exploitation of the services of the physician for the financial profit of the agency concerned. Such a procedure is beneath the dignity of professional practice and is harmful alike to the profession of medicine and the welfare of the people.

Section 30.—Physicians, as good citizens, possessed of special training, should advise concerning the health of the community wherein they dwell. They should bear their part in enforcing the laws of the community and in sustaining the institutions that advance the interests of humanity. They should cooperate especially with the proper authorities in the administration of sanitary laws and regulations.

Section 31.—Physicians, especially those engaged in public health work, should enlighten the public concerning quarantine regulations and measures for the prevention of epidemic and communicable diseases. At all times the physician should notify the constituted public health authorities of every case of communicable disease under his care, in accordance with the laws, rules, and regulations of the health authorities. When an epidemic prevails, a physician must continue his labors without regard to the risk to his own health.

Part Two

THE DOMAIN OF MANNERS

Section 1.—As a general rule, a physician should not attempt to treat members of his family or himself. Consequently, a physician should cheerfully and without recompense give his professional services to physicians or their dependents if they are in his vicinity. When a physician from a distance is called to advise another physician about his own illness or about that of one of his family dependents, and the physician to whom the service is rendered is in adequate financial circumstances, a compensation that will at least meet the traveling expenses of the visiting physician should be proffered him. When such a service entails a pecuniary loss to the visitor such loss may, in part at least, be provided for in the compensation offered.

Section 2.—When a physician or a member of his dependent family is seriously ill, he or his family should select a physician to take charge of the patient. The family may ask the physician in charge to consult other physicians.

Section 3.—After the physicians called in consultation have completed their investigations, they and the physician in charge should discuss the course to be followed. Statements should not be made nor should discussion take place in the presence of the patient, his family or his friends, unless all physicians concerned are present or have consented to the arrangement.

Section 4.—The physician in charge of the case is responsible for treatment of the patient. Consequently, he may prescribe for the patient at any time and is privileged to vary the treatment outlined and agreed on at a consultation whenever, in his opinion, such a change is warranted. However, after such a change, it is best to call another consultation; then the physician in charge should state his reasons for departing from the course decided at the previous conference. When an emergency occurs during the absence of the physician in charge, a consultant may assume authority until the arrival of the physician in charge, but his authority should not extend further without the consent of the physician in charge.

Section 5.—Should the physician in charge and a consultant be unable to agree in their view of a case, another consultant should be called or the differing consultant should withdraw. However, since the patient employed the consultant to obtain his opinion, he should be permitted to state it to the patient, his relative or his responsible friend, in the presence of the physician in charge.

Section 6.—When a physician has acted as consultant, he should not become the physician in charge except with the consent of the physician who was in charge at the time of the consultation or in response to the demands of the patient, his family or responsible friends.

Section 7.—When a physician makes social calls on another physician's patient he should avoid conversation about the patient's illness.

Section 8.—When a physician does succeed another physician in charge of a case, he should not disparage, by comment or insinuation, the one who preceded him. Such comment or insinuation tends to lower the confidence of the patient in the medical profession and so reacts against the patient, the profession and the critic.

Section 9.—When a physician is called in an emergency because the personal or family physician is not at hand, he should provide only for the patient's immediate need and should withdraw from the case on the arrival of the personal or family physician. However, he should first report to the personal or family physician the condition found and the treatment administered.

Section 10.—When several physicians have been summoned in a case of sudden illness or of accident, the first to arrive should be considered the physician in charge. However, as soon as is practicable, or on the arrival of the acknowledged personal or family physician, the first physician should withdraw. Should the patient, his family or his responsible friend wish some one other than he who has been in charge of the case, the patient or his representative should advise the personal or family physician of his desire. When, because of sudden illness or accident, a patient is taken to a hospital without the knowledge of the physician who is known to be the personal or family physician, the patient should be returned to the care of the personal or family physician as soon as is feasible.

Section 11.—When a physician is requested by a colleague to care for a patient during the colleague's temporary absence, or when, because of an emergency, a physician is asked to see a patient of a colleague, the physician should treat the patient in the same manner and with the same delicacy that he would wish used in similar circumstances if the patient were his responsibility. The patient should be returned to the care of the attending physician as soon as possible.

Section 12.—When a physician attends a woman who is in labor because the one who was engaged to attend her is absent, the physician summoned in the emergency should relinquish the patient to the first engaged, on his arrival. The one in attendance is entitled to compensation for the professional services he may have rendered.

Section 13.—Physicians should recognize and promote the practice of pharmacy as a profession and should encourage the cooperation of the pharmacist in education of the public concerning the practice of ethical and scientific medicine.

Part Three

MISCELLANEOUS

Section 1.—The House of Delegates may amend these Principles at any session on the approval of two-thirds of the members of the House of Delegates present and voting, provided the proposed amendment shall have been introduced at the preceding session.

6. Chapter XII, Sec. 4, of the Bylaws provides: "(G) Amendments to the Constitution and Bylaws to which shall be referred all proposed amendments to the Constitution or Bylaws;" The Council believes that matters relating to the Principles of Medical Ethics should also be referred to the Reference Committee on Amendments to the Constitution and Bylaws. It therefore recommends that Chapter XII, Sec. 4(G) be amended by deleting the semicolon after the word "Bylaws" and adding the words "and matters pertaining to the Principles of Medical Ethics of the American Medical Association."

7. The reference committees of the House of Delegates are provided for and enumerated in Chapter XII, Section 4 of the Bylaws. This enumeration is not in alphabetical order and the Council therefore recommends that Chapter XII, Section 4(A) through (M) be arranged in the following order:

(A) Amendments to the Constitution and Bylaws
(B) Board of Trustess and Secretary, Reports of
(C) Credentials
(D) Executive Session
(E) Hygiene, Public Health, and Industrial Health
(F) Insurance and Medical Service
(G) Legislation and Public Relations
(H) Medical Education and Hospitals
(I) Medical Military Affairs
(J) Miscellaneous Business
(K) Reports of Officers
(L) Rules and Order of Business
(M) Sections and Section Work

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, submitted the following report, which was adopted:

Supplementary Report of Council on Constitution and Bylaws: Your reference committee in consultation with members of the Council on Constitution and Bylaws gave careful consideration to sections 1 and 5 of this supplementary report, and your reference committee recommends that these portions of the report be tabled for further consideration and action at the annual meeting of the House of Delegates to be held in Chicago in June, 1956.

Proposed Principles of Medical Ethics and Precepts of Manners of the American Medical Association: Your reference committee in consultation with members of the Council on Constitution and Bylaws and of the Judicial Council considered carefully the proposed Principles of Medical Ethics and Precepts of Manners of the American Medical Association. In discussion it became evident that there was need for wide distribution of these Principles and careful study of the proposed changes not only by this reference committee but also by all members of the House and in fact all members of the Association. It seemed desirable also that the two Councils, the Council on Constitution and Bylaws and the Judicial Council, should meet in joint session to consider these proposals. Your reference committee therefore recommends that these proposals be tabled for further consideration at the next annual session of the House to be held in Chicago in June, 1956. In the meantime, it is recommended that these proposals in their entirety be widely publicized and that consideration be given to publishing, in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and also in state medical journals, these proposed changes in the Principles. It is also recommended that consideration be given to the mailing of copies to each member of the Association. Finally, your reference committee recommends that prior to the meeting in Chicago next June the Council on Constitution and Bylaws and the Judicial Council meet in joint session to consider these proposed changes.

REPORT OF REFERENCE COMMITTEE ON AMENDMENTS TO THE CONSTITUTION AND BYLAWS

Dr. Jay J. Crane, Chairman, Section on Urology, read the following report, which was adopted:

Your Reference Committee on Amendments to the Constitution and Bylaws has carefully reviewed assignments referred to it consisting of paragraphs 2, 3, 4A and B, 6, and 7 of the supplementary report of the Council on Constitution and Bylaws.

Paragraph 2 of the supplementary report proposes that a new paragraph (F) be added to Section 4, Chapter 3, of the Bylaws, which provides that Associate Members shall not be required to pay membership dues to the American Medical Association and shall not receive any publication of the American Medical Association except by subscription. Your reference committee recommends approval of this paragraph of the report.

The Council recommended in paragraph 3 that the name of the Section on Physical Medicine and Rehabilitation be changed to Section on Physical Medicine, and that the name of the Section on Dermatology and Syphilology be changed to Section on Dermatology. The Council recommends therefore that Chapter VII, Section 1 (J), of the Bylaws be amended by deleting the words "and Syphilology," and that Chapter VII, Section 1 (S), of the Bylaws be amended by deleting the words "and Rehabilitation." Your reference committee recommends approval of this paragraph of the report.

Paragraph 4 (A) of the Council's supplementary report related to suggestions designed to clarify the provisions of the Bylaws governing the activities of the Scientific Assembly. Two of these suggestions were approved by the Council on Constitution and Bylaws and the Board of Trustees. Chapter VI, Section 1, of the present Bylaws provides that the general meetings shall be presided over by the President-Elect or in his absence or at his request by the Vice President or by a member of the Board of Trustees. Because of the fact that the Scientific Assembly, the Board of Trustees, and the House of Delegates all meet on the same day it is becoming increasingly difficult for one of these officers to preside at these general meetings, it has been propsed and recommended by the Council that Chapter VI, Section 1, be amended so that the "general meetings of the Scientific Assembly shall be arranged by the Board of Trustees. The Board of Trustees shall select the official who will preside at the general meetings of the Scientific Assembly." Your reference committee recommends approval of this part of paragraph 4 of the report.

Paragraph 4 (B): Chapter VII, Section 4, of the present Bylaws provides: "The election of officers of the several sections, except the Section on Miscellaneous Topics, shall be the first order of business of the second meeting of the Section at each Scientific Assembly. Only those may participate in an election who have indicated on registering the desire to affiliate with that section." Often, the second meeting of a section is a joint meeting with another section and confusion may result if an election of officers must be held at that time. Sections may make rules for the conduct of their proceedings and these rules may provide for an election of officers at some other time during the annual meeting. If the first sentence of Chapter VII, Section 4, of the Bylaws were eliminated, the amended Bylaws will provide "The election of officers of the several sections, except the Section on Miscellaneous Topics, shall be held during the annual meeting of the Section." Your reference committee recommends approval of paragraph 4 (B) of the report.

Paragraph 6: Chapter XII, Section 4 (G), of the Bylaws reads, "Amendments to the Constitution and Bylaws to which shall be referred all proposed amendments to the Constitution or Bylaws." The Council believes that matters relating to the Principles of Medical Ethics should also be referred to the Reference Committee on Amendments to the Constitution and Bylaws and recommends that Chapter XII, Section 4 (G), be amended by deleting the semicolon after the word "Bylaws" and adding the words "and matters pertaining to the Principles of Medical Ethics of the American Medical Association." Your reference committee recommends approval of paragraph 6 of the Council's supplementary report.

Paragraph 7: The reference committees of the House of Delegates are provided for and enumerated in Chapter XII, Section 4, of the Bylaws. This enumeration is not in alphabetical order and the Council therefore recommends that Chapter XII, Section 4 (A) through (M) be rearranged in the following order:

(A) Amendments to the Constitution and Bylaws
(B) Board of Trustess and Secretary, Reports of
(C) Credentials
(D) Executive Session
(E) Hygiene, Public Health, and Industrial Health
(F) Insurance and Medical Service
(G) Legislation and Public Relations
(H) Medical Education and Hospitals
(I) Medical Military Affairs
(J) Miscellaneous Business
(K) Reports of Officers
(L) Rules and Order of Business
(M) Sections and Section Work

Your reference committee recommends approval of this portion of the Council's supplementary report.

Report of American Medical Education Foundation

Dr. Louis H. Bauer presented the report of the American Medical Education Foundation of which he is President, (see The Journal, Oct. 29, 1955, pages 946-947), which was referred to the Reference Committee on Medical Education and Hospitals.

Mr. Speaker and Members of the House: I am not going to read the report, but I would like to invite your attention to some items that I think should be stressed. There are several states that have given treasury gifts. We received one this morning from California, we received one last June from New Jersey, and we have also had treasury gifts from Oregon, Kansas, Virginia, Massachusetts, and Tennessee. I understand that Virginia, although it has made one gift this year, is going to make another. But what I think we fail to realize is that there are some state societies that have increased their dues, and the dues increase has been going to the support of the Foundation. I believe Illinois leads the parade. I think Illinois started that in 1952, and has been doing it every year since. Utah followed in 1954, and since then Nevada, California, and Idaho have followed suit.

I would not want to stand here and tell the state societies what they ought to do about increasing their dues for medical education, but I do think that every society ought to do its share, and I think it is hardly fair that the physicians of Illinois should contribute so large a share of the total amount. I think we owe a debt of gratitude to the Illinois State Medical Society and to those other state medical societies that are seeing that the physicians participate in this program, but I also think all of you should go back and see that your states do proportionately well. Whether you do it on a voluntary or a compulsory basis is your business, but let's see if we can do a little better than we have been doing in the past, because it is going to be tragic if we are unable to support our medical schools.

This spring there will be a Medical Education Week, and we are going to suggest to the state societies that they gear their campaigns so as to tie into this Medical Education Week. Sometimes it is easier to raise money in a short space of time than it is over a long period.

I also want to pay tribute to the Woman's Auxiliary. The Auxiliary raised about $80,000 this year, which might also put some of us to shame. It is also engaging in a campaign during Medical Education Week.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George M. Fister, Chairman, Utah, presented the following report, which was adopted:

Your reference committee reviewed the report of the American Medical Education Foundation and was pleased at the spontaneous enthusiasm of various members of the Association who appeared before it recommending that the Association raise its dues designating that increase to the Foundation. Your reference committee wishes to commend the Foundation for its activities to date and because of the stimulation which developed in the hearing, your committee wishes to recommend that the Board of Trustees give consideration to a dues increase for its members for this and other purposes.

Report of Committee on Blood

Dr. Leonard W. Larson, Chairman, submitted the following report, which was referred to the Reference Committee on Miscellaneous Business:

The Committee on Blood has not met since the last meeting of the House of Delegates. You will recall that in the Committee's report to this House last June, it was announced that the Blood Foundation had been incorporated. Your attention is directed to the report of the Committee on Blood which was published in The Journal of the American Medical Association, Aug. 6, 1955, in which the history of the Committee was briefly reviewed, the principles relative to blood banking as adopted by this House were stated, the Red Cross Blood Program was reviewed, and reference was made to the establishment and bylaws of the Blood Foundation.

The name of the Blood Foundation has been changed to "Joint Blood Council, Inc." Dr. Frank Wilson, formerly director of the American Medical Association's Washington Office, has been employed as Executive Vice President of the Council, and the headquarter's office has been established in Washington, D. C.

It is the sincere hope of the members of the Committee on Blood that the purpose for which the Joint Blood Council was organized will be fulfilled. The Council will succeed if those who are concerned with blood banking in the United States will give it their whole hearted cooperation.

The purpose of the Joint Blood Council is as follows:

> To develop ways and means to make blood and its derivatives available to all persons in the United States; to stimulate and advise on areas of research in the collection, preservation, and use of blood and its derivatives; to collect, study and disseminate information on blood and blood derivatives; to establish minimal standards for voluntary accreditation of blood banks and to establish a means of inspection for accreditation; to coordinate existing systems and encourage and institute plans where necessary for the exchange of blood or blood credits between accredited banks on a state, regional and national basis; to encourage the public through appropriate means to donate blood for civilian and defense requirements and to assist in the establishment of uniform national publicity policies; to disseminate annually a list of blood banks accredited by this organization; to serve, on invitation, as a fact-finding and arbitration body in disputes arising from the collection and use of blood and its derivatives; to serve, on invitation, as an advisory group to federal and military agencies having to deal with blood and its derivatives.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, read the following report, which was adopted:

Report of the Committee on Blood: Your reference committee has studied the report of the Committee on Blood and notes with approval the establishment of the Joint Blood Council, Inc., and the continued interest of our Committee on Blood in this entire program. Your reference committee recommends that this report be adopted.

Report of the Committee on Medical Practices

The Speaker called the attention of the House to the fact that action on the report of the Board of Trustees on the Report of the Committee on Medical Practices had been held over from the June, 1955, meeting (see The Journal, July 2, 1955, page 735) so that the members of the House might have opportunity to study the full report of the Committee. The Speaker declared that the report is hereby entered into the House, and referred it to the Reference Committee on Insurance and Medical Service.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

The report of the reference committee on the report of the Committee on Medical Practices will be found following supplementary report F of the Board of Trustees on page 1652 of the Dec. 24, 1955, issue of The Journal.

Introduction of Resolutions

The Speaker called for the introduction of resolutions as numbered.

No. 1. Resolution on Woman's Auxiliary Support of American Medical Education Foundation

Dr. James M. Kolb, for the Arkansas delegation, introduced the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

> Whereas, The American Medical Association established in 1950 the American Medical Education Foundation "to provide an instrument through which individual physicians, state and county medical societies, and other professional organizations can make contributions in support of medical education"; and
>
> Whereas, The Woman's Auxiliary to the American Medical Association has made contributions to this Foundation annually since 1951, showing an increasing interest in its success; therefore be it
>
> *Resolved,* That the House of Delegates of the American Medical Association requests the Woman's Auxiliary to continue its efforts in raising funds for medical education by urging each of its constituent auxiliaries to participate actively in financial support of the American Medical Education Foundation.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, presented the following report, which was adopted unanimously.

Resolution No. 1 on Woman's Auxiliary Support of A. M. E. F.: Your reference committee fully supports this resolution that the House request the Woman's Auxiliary to continue efforts to raise funds for medical education by urging each of its constituent auxiliaries to participate actively in financial support of the American Medical Education Foundation. In doing so your reference committee wishes especially to recommend that the House extend to the Woman's Auxiliary an expression of its sincere appreciation of the magnificent contributions already made by the Woman's Auxiliary in support of medical education. Your reference committee recommends that this resolution be adopted.

No. 2. Resolutions on Distribution of Salk Poliomyelitis Vaccine

Dr. Milford O. Rouse, for the Texas delegation, presented the following resolutions, which were referred to the Reference Committee on Hygiene, Public Health, and Industrial Health:

> Whereas, Dr. Jonas Salk has accomplished for the National Foundation for Infantile Paralysis one of its major purposes, namely, the development to a commercial state of an apparently effective vaccine against poliomyelitis; and

Whereas, Further research by him and other investigators gives promise of improvement of poliomyelitis immunization with consequent continued need of supporting funds; and

Whereas, The National Foundation for Infantile Paralysis stated its intention to be out of the business of purchasing and supplying poliomyelitis vaccine by Oct. 1, 1955; now therefore be it

Resolved, That we, the members of the American Medical Association, do heartily approve the publicly expressed policy of the National Foundation for Infantile Paralysis to return to, and maintain, its original policy of devoting its funds to proper research and to assistance in the actual care of patients disabled by poliomyelitis; and be it further

Resolved, That the House of Delegates of the American Medical Association go on record as recommending that the further purchase and distribution of Salk vaccine be carried on by the presently available commercial avenues used for other immunizing agents.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, read the following report, which was adopted:

Resolution No. 2 on Distribution of Salk Poliomyelitis Vaccine and Resolution No. 13 on Distribution of Salk Vaccine: Your committee considered Resolutions No. 2 and No. 13 jointly as they both contained parallel subject matter. These resolutions were provocative of much discussion contributed by many persons. After prolonged consideration your committee wishes to present a substitute resolution consisting of Resolution No. 2 with the addition of the following final paragraph: "and be it further *Resolved,* That all vaccines, once proven, should enter the usual channels of distribution."

No. 3. Resolutions on Amendment of Constitution of United States Regarding Electoral College

Dr. Milford O. Rouse, on behalf of the Texas delegation, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

PREAMBLE

In the election of the President of the United States the form of representation of the states has long been violently distorted by use of the general ticket in each state's election of its presidential electors—election of party slates, en bloc, by simple statewide pluralities. This distortion of the form of representation has put a high premium on small pluralities in large pivotal states where organized pressure groups all too often hold the balance of political power in presidential elections, giving these groups an influence on the election of a President which they do not have in the election or the Congress. The presidential electors were designed to be counterparts in number of each state's representation in the Congress in order to give each state the same voice in the election of a President that it has in Congress. In view of these considerations, now therefore be it

Resolved, That the Constitution of the United States be amended to provide for the choosing of presidential electors in the same manner in which members of the Congress are elected; and be it further

Resolved, That copies of this resolution be sent to the members of the Congress of the United States and to the members of the legislatures of the several states.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, read the following report, which was adopted:

Resolution No. 3 on Amendment to Constitution of the United States Regarding Electoral College: Your committee, while in sympathy with the purpose of this resolution, feels, after careful consideration, that this is a matter for individual decision by each citizen. It therefore commends thorough study of the proposal to physicians as citizens. Your committee recommends, therefore, that no other action on the resolution be taken at this time.

No. 4. Resolution on Doctor-Draft Law

Dr. Milford O. Rouse, for the Texas delegation, submitted the following resolution, which was referred to the Reference Committee on Medical Military Affairs:

Whereas, In spite of the feeling of the medical profession that no further drafting of physicians as a class into the military services was justifiable on the basis of exigency, the President and Congress did extend this legislation for two years; and

Whereas, Such legislation is strictly class legislation and therefore discriminatory and unconstitutional; now therefore be it

Resolved, That the Board of Trustees of the American Medical Association be requested and empowered to prepare and financially support a test case of the present Doctor-Draft Law through the federal courts to and including the Supreme Court of the United States for the purpose of securing a direct, final, and clear judicial opinion in the constitutionality of the said Doctor-Draft Law.

REPORT OF REFERENCE COMMITTEE ON MEDICAL MILITARY AFFAIRS

Dr. Charles H. Richardson Sr., Chairman, Georgia, read the following report, which was adopted:

Your committee would now like to report on Resolution No. 4 proposed by the Texas Delegation. In essence, this resolution proposes an American Medical Association-sponsored test of the legality of the Doctor-Draft Law. By way of introduction it is to be stated that since the passage of this special draft act in September, 1950, with subsequent extensions, it has plagued the medical profession. It is openly conceded that this is discriminatory legislation and disliked by legislators, government administrators, and physicians in and out of uniform. Your committee is reminded that this law was extended on June 30, 1955, for two additional years and will continue in force until July 1, 1957.

To support Resolution No. 4 would present innumerable and complex legal and administrative problems for the American Medical Association. Legal advice is to the effect that the Association cannot be the plaintiff but that a civilian physician would have to be drafted as a private into the Armed Forces under the current Doctor-Draft Act who would be willing to become the plaintiff. Furthermore, to process such a case through the courts would be most time-consuming and expensive.

Your committee is of the opinion that such a test case has been tried and a decision rendered. Reference is made to the test case *Bertelsen* v. *Cooney,* which was heard in a federal district court of the fifth circuit. The court ruled that the constitutional war powers are plenary and that Congress has unlimited power to conscript on its own terms without review by the courts. On appeal before the Fifth Circuit Court of Appeals the decision was affirmed. The court stated, "whether the legislation is wise or unwise, fair or unfair, necessary or unnecessary, is for legislative not judicial determination. Congress has the power to raise and support armies. It is not for the judiciary to review how the forces shall be raised nor of what elements they shall be composed. It is for Congress to say where, who and to what extent, and how they shall be selected." The United States Supreme Court, upon appeal, refused to accept jurisdiction, in legal effect sustaining the opinion of the lower court.

Your committee believes that the most constructive action to be taken would be strong support of the career incentive program for medical officers and that no useful purpose would be served by further testing the legality of the Doctor-Draft Act. Your committee, therefore, recommends that this resolution be not adopted.

No. 5. Resolutions on Sears Roebuck Foundation Plan for Medical Practice Units

Dr. Milford O. Rouse, for the Texas delegation, introduced the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

Whereas, The Sears Roebuck Foundation in cooperation with the American Medical Association has established a new plan to assist in establishing medical practice units in areas where additional medical care is needed and for physicians who are unable to secure bankable commercial loans elsewhere; and

Whereas, The medical profession for many years has directed much research and planning aimed at providing the best possible distribution of medical facilities throughout the United States; and

Whereas, One of the obstacles encountered in the establishment of practices in small cities and towns or rural areas has often been the physician's inability to finance the increasing expense of his office and equipment; and

Whereas, The Sears Roebuck Foundation in providing an interest-free loan fund properly administered provides one avenue to meet this problem of financing; and

Whereas, The Sears Roebuck Foundation has sought and received the assistance of medical leadership in designating areas of need in determining proper loans; and

WHEREAS, The House of Delegates of the American Medical Association desires to commend Sears Roebuck on the splendid cooperation offered the medical profession through the planning and establishment of this Foundation and this special project; and

WHEREAS, It is the belief that the example set by Sears Roebuck Foundation is a worthwhile pattern which other business and industrial leaders may follow in assisting in an over-all effort to provide the best medical care in the world to the entire population of our nation; now therefore be it

Resolved, That the House of Delegates of the American Medical Association go on record as commending this fine business organization for thoughtfulness and foresight in creating and sponsoring this worthwhile project; and be it further

Resolved, That copies of this resolution be sent to the proper officials of Sears Roebuck and the Sears Roebuck Foundation.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, read the following report, which was adopted:

Resolution No. 5 on the Sears Roebuck Foundation Plan for Medical Practice Units: Your reference committee concurs in this resolution that the House of Delegates of the American Medical Association go on record as commending this fine business organization for thoughtfulness and foresight in sponsoring this worthwhile project and that copies of this resolution be sent to proper officials of the Sears Roebuck Company and the Sears Roebuck Foundation. All of the testimony before the reference committee commended in glowing terms this fine project. Your reference committee recommends that this resolution be adopted.

No. 6. Resolution on Changing Name of Section on Preventive and Industrial Medicine and Public Health

Dr. Rutherford T. Johnstone, Section on Preventive and Industrial Medicine and Public Health, introduced on behalf of the section, the following resolution, which was referred to the Reference Committee on Sections and Section Work:

WHEREAS, The name of the Section on Preventive and Industrial Medicine and Public Health is long and unwieldy; and

WHEREAS, The specialty of preventive medicine is now recognized to include the disciplines of public health, aviation medicine, and occupational medicine; and

WHEREAS, The specialty board of preventive medicine approved by the Council on Medical Education and Hospitals now certifies and recognizes specialists in these three fields; and

WHEREAS, The prevention of disease is the fundamental and essential philosophy of these groups; now therefore be it

Resolved, That the Section on Preventive and Industrial Medicine and Public Health respectfully request that the House of Delegates of the American Medical Association change the name of the Section on Preventive and Industrial Medicine and Public Health to Section on Preventive Medicine.

REPORT OF REFERENCE COMMITTEE ON SECTIONS AND SECTION WORK

Dr. Gilson Colby Engel, Chairman, Pennsylvania, submitted the following report, which was adopted:

Resolution No. 6: The "Resolved" states as follows: "That the Section on Preventive and Industrial Medicine and Public Health respectfully request that the House of Delegates of the American Medical Association change the name of the Section on Preventive and Industrial Medicine and Public Health to Section on Preventive Medicine." Dr. Johnstone appeared before your reference committee and assured it that all groups were in accord on this change and stated the factual reasons for recommending this change. Your reference committee recommends to the House of Delegates changing of the name of the Section on Preventive and Industrial Medicine and Public Health to Section on Preventive Medicine.

No. 7. Resolution on Amendment of Principles of Medical Ethics, Chapter IV, Section 1

Dr. Lawrence R. Dame, Massachusetts, for Dr. Earle M. Chapman, Massachusetts, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, Some physicians have abused the Principles of Medical Ethics by claiming insurance money for the care of their own families; and

WHEREAS, Chapter IV, Section 1, of the Principles of Medical Ethics of the American Medical Association reads: "As a general rule, a physician should not attempt to treat members of his family or himself. Consequently, a physician should cheerfully and without recompense give his professional services to physicians or their dependents if they are in his vicinity;" and

WHEREAS, Physicians are called on to care for physicians or their families who may come from the vicinity or from a distance for consultation, and as insurance to pay for professional medical services may be available as recompense; therefore be it

Resolved, To amend Chapter IV, Section 1, of the Principles of Medical Ethics to delete the words "consequently," "and without recompense," and "if they are in his vicinity" so that the section shall read as follows:

> As a general rule, a physician should not attempt to treat members of his family or himself nor shall he receive financial recompense for such treatment if rendered. A physician should cheerfully give his professional services to other physicians or their dependents.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, read the following report, which, after discussion and amendment, was adopted:

Resolution No. 7 on Amendment of Principles of Medical Ethics, Chapter IV, Section 1: Your reference committee supports this resolution in principle but recommends that no action be taken on it, since we have been assured by the chairman of the Judicial Council that this resolution is already fully covered in the Principles of Medical Ethics as already stated and that the Judicial Council has gone on record as stating that it is not unethical for a physician to accept payment from an insurance company for services rendered to a medical colleague or one of his dependents.

Nos. 8 and 9

Dr. Charles M. Hamilton, for the Tennessee delegation, introduced the following two resolutions, Nos. 8 and 9, which were referred to the Reference Committee on Legislation and Public Relations:

No. 8. Resolutions on Social Security and the Youth of the Nation

WHEREAS, The future liability of social security is expanding by leaps and bounds; and

WHEREAS, The taxes to support this measure are wholly inadequate; and

WHEREAS, The burden of this obligation will fall on the shoulders of the next generation; and

WHEREAS, The youth of the nation is unaware of what is being fostered upon them; therefore be it

Resolved, That the American Medical Association insist that the various states promote an educational campaign to inform school children by furnishing literature to be read, by speeches in schools, or possibly by offering awards for the best paper read in high schools on social security; and be it further

Resolved, That the American Medical Association furnish material for such a program; and be it further

Resolved, That assistance be elicited from Chambers of Commerce and other civic organizations.

No. 9. Resolutions on Exploitation of Social Security

WHEREAS, The gradual expansion of social security, in both benefits and those eligible to receive them, has brought upon the citizens of the United States an obligation greater than the national debt; and

WHEREAS, The taxes collected to meet this liability are only a trivial token gesture; and

WHEREAS, Social security is being exploited politically by both parties; therefore be it

Resolved, That the American Medical Association recommend to the Congress that the social security program be put on a sound actuarial basis; and be it further

Resolved, That the entire framework of social security be completely separated from the general tax fund.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

The report of the reference committee on Resolutions No. 8 and 9 will be found following supplementary report F of the Board of Trustees on page 1650 of the Dec. 24, 1955, issue of THE JOURNAL.

No. 10. Formulation of Contract to be Offered by Medical Society Sponsored Voluntary Health Insurance Plans

Dr. Raymond M. McKeown, on behalf of the Oregon State Medical Society, presented the following resolution, which was referred to the Reference Committee on Insurance and Medical Service:

Whereas, The American Medical Association is deeply interested in the sound development of all forms of voluntary health insurance; and

Whereas, The Association is especially interested in the healthy growth of the voluntary health insurance plans sponsored by its constituent and component medical societies; and

Whereas, The medical society sponsored plans are and should continue to be independent and free to offer contracts to meet the particular needs of their respective localities; and

Whereas, Each medical society sponsored plan nevertheless needs to be *in a position to participate with other medical society sponsored* plans in offering organizations engaged in interstate operations a contract containing uniform minimum standard provisions; and

Whereas, The Council on Medical Service of the Association is equipped to develop such a contract in collaboration with representatives of the medical society plans; therefore be it

Resolved, That the Council on Medical Service be authorized and directed to arrange, at the earliest practicable date, a national meeting to which all the medical society sponsored plans shall be invited to send representatives to collaborate in formulating such a contract and to consider such other matters of mutual concern as the Council and the participating medical society sponsored plans may jointly deem desirable.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, submitted the following report, which was adopted:

Resolution No. 10 on Formulation of Contract to be Offered by Medical Society Sponsored Voluntary Health Insurance Plans: Your committee listened to considerable discussion on this resolution. It was the consensus of those speaking that there is indeed a distinct need for a greater degree of uniformity and for some minimum standard provisions by medical society sponsored voluntary health insurance plans. On the other hand, because of geographic, legal, and other considerations, there are many obstacles in the way of this goal. In addition, your committee believes that this is appropriately a task to be performed by the plans themselves, and particularly the Blue Shield Commission, and is not properly in the province of the American Medical Association. It is the understanding of your committee that at this time several agencies are making studies looking toward some solution for this obviously perplexing problem. Your committee, therefore, recommends that this resolution be not adopted.

No. 11. Resolutions on Creation of a Medical Practices Committee

Dr. Lester D. Bibler, Section on General Practice, introduced the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service:

Whereas, A special committee of the American Medical Association whose report was given to the House of Delegates in June, 1955, has completed an intensive study of the basic causes leading to certain unethical practices and to unfavorable publicity; and

Whereas, The findings and recommendations of this committee should be studied and put into practical operation by the American Medical Association; therefore be it

Resolved, That a Medical Practices Committee be created by the American Medical Association to begin study of the relative value of diagnostic, medical, and surgical services for the whole of the practice of medicine and surgery; and be it further

Resolved, That this committee assist the Public Relations Department of the American Medical Association to present a program of public education on the value of diagnostic and medical care; and be it further

Resolved, That this committee use its full influence to discourage any arbitrary restrictions by hospitals against general practitioners as a group or as individuals; and be it further

Resolved, That this committee reaffirm and enforce action of this House of Delegates in 1947 "that any rule barring a physician from staff privileges because he does not hold board certification or membership in a specialty society is absolutely against the American Medical Association policy."

No. 12. Resolutions on Creation of Permanent Committee on Medical Practices

Dr. Wendell C. Stover, for the Indiana delegation, introduced the following resolutions, which also were referred to the Reference Committee on Insurance and Medical Service:

Whereas, The report of the interim Committee on Medical Practices was presented to this House of Delegates in June, 1955, in which the committee has completed its intensive study of the basic causes leading to certain unethical practices and to unfavorable publicity; and

Whereas, The findings and recommendations of this committee deserve the intensive study by the physicians of this country and by the American Medical Association, which should put said recommendations into practical operation; now therefore be it

Resolved, That a permanent Committee on Medical Practices be created in the American Medical Association to conduct a continuing study of the relative value of diagnostic, medical, and surgical services and to report its findings and recommendations to this House in the same manner as is now followed by other committees and councils of the Association; and be it further

Resolved, That this committee cooperate in every way and assist the Public Relations Department of the American Medical Association to present a program of public education designed to bring about a better understanding of all fields of medical practices; and be it further

Resolved, That this committee use its full influence to discourage any arbitrary restrictions by hospitals against general practitioners as a group or as individuals.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

The report of the reference committee on Resolutions No. 11 and 12 will be found following supplementary report F of the Board of Trustees on page 1652 of the Dec. 24, 1955, issue of The Journal.

No. 13. Resolutions on Distribution of Salk Vaccine

Dr. Eli S. Jones, on behalf of the Indiana delegation, presented the following resolutions, which were referred to the Reference Committee on Hygiene, Public Health, and Industrial Health:

Whereas, The physicians of the United States, through their local medical societies voluntarily cooperated with the National Foundation for Infantile Paralysis in the nationwide tests of the efficiency of the Salk polio vaccine; and

Whereas, The National Foundation for Infantile Paralysis then used funds to purchase vaccine for free inoculation of all first and second grade *children without consideration of parental ability to pay; and*

Whereas, The United States government has appropriated money to further the free inoculation of individuals without regard for financial resources of such individuals to provide such services for themselves at their own expense; and

Whereas, Both the National Foundation and the government programs set an unnecessary and needless precedent; and

Whereas, Such activities entered upon by voluntary health organizations or governmental units on a universal basis are in direct violation of the essential principles of free enterprise and sound medical practices; now therefore be it

Resolved, That the American Medical Association condemns the practice of voluntary health organizations and the government supplying vaccine free of charge to the public of this nation and insist upon immediate termination of such practices except the practice of providing this benefit to individuals of this nation financially unable to pay for such services; and be it further

Resolved, That the Board of Trustees be empowered and instructed to voice opposition in behalf of the physicians of the United States to these and any subsequent programs violating the principles of free enterprise and sound medical practices, calling attention to the willingness of the physicians of this country to cooperate in seeing that every deserving person in this nation will receive the benefits of preventive medicine if the honest need is made known.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

The report of the reference committee on Resolution No. 13 will be found following Resolution No. 2 on page 1759 of this issue of The Journal.

No. 14

The Speaker announced that Resolution No. 14 had been withdrawn.

No. 15. Resolutions on Establishment of Cancer Commissions by State Medical Societies

Dr. George A. Unfug, Colorado, introduced the following resolutions, which were referred to the Reference Committee on Hygiene, Public Health, and Industrial Health:

WHEREAS, The many claims for new methods of diagnosing and treating cancer that are not presented through the usual medical channels of communication or supported by adequate scientific and clinical evidence of value have created grave problems for practicing physicians and for those agencies and leaders responsible for public health and for advising the public; and

WHEREAS, The American Association for Cancer Research, the American Cancer Society, the American Medical Association, the Damon Runyon Memorial Fund for Cancer Research, the Food and Drug Administration, and the National Cancer Institute, because of concern over this situation, sought aid from the National Academy of Sciences which established the Committee on Cancer Diagnosis and Therapy within the National Research Council to study this problem; and

WHEREAS, The studies of this committee over a period of four and one-half years have led to the conclusion that since such claims gain their original public support locally, thus creating their first impact on a restricted community, and only later, and often as a result of sporadic promotional efforts by a few prominent individuals, do the proposals receive national attention, it is logical so to design protective procedures as to handle such situations at the local level; therefore be it

Resolved, That the collection and evaluation of scientific and clinical evidence on claims for the diagnosis and treatment of cancer be recognized as a responsibility of state and regional medical societies; and be it further

Resolved, That the state medical societies be encouraged to establish state cancer commissions or committees to assume this responsibility, following the general pattern developed by the California Medical Association and working in close cooperation with other local and national health agencies; and be it further

Resolved, That the House of Delegates of the American Medical Association urges the state medical societies to establish such groups, and that at an opportune time the Association arrange a conference of representatives from the various state medical societies (in cooperation with the other sponsoring agencies and the Committee on Cancer Diagnosis and Therapy, if this is desired) for the consideration of effective organizations and study mechanisms.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Utah, read the following report, which was adopted:

Resolution No. 15 on Establishment of Cancer Commissions by State Medical Societies: Your committee approves Resolution No. 15 and recommends its referral to the Board of Trustees for implementation.

No. 16. Resolution on Survey of Medical Profession by State Societies Regarding Social Security Act

Dr. Clifford C. Sherburne, on behalf of the Ohio State Medical Association, introduced the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, Misunderstanding exists about the position of the medical profession on the question of the inclusion of physicians in the Old Age and Survivors Insurance provisions of the federal Social Security law; and

WHEREAS, The Ohio State Medical Association, in accordance with a mandate from its House of Delegates, made a survey of its membership on this question; and

WHEREAS, The Ohio State Medical Association sent ballots and pro and con material to 8,360 members, asking them to vote on the following: "Do you favor extension of the Old Age and Survivors benefits coverage of the federal Social Security Act to physicians? If your answer is 'Yes' do you believe participation by physicians should be: Compulsory or voluntary?"; and

WHEREAS, Four thousand nine hundred and twelve ballots were returned, approximately 60% of those sent out, with the following results: 2,441 ballots were marked "no" indicating that those physicians are not in favor of social security coverage for physicians on any basis; only 370 votes were cast in favor of compulsory coverage; those favoring voluntary participation numbered 2,070 and 19 physicians voted in favor of coverage but without stating a preference; 12 ballots could not be tabulated because of irregularity in answering the questions; and

WHEREAS, The poll conducted by the Ohio State Medical Association clearly indicates that an overwhelming majority of the members voting are opposed to compulsory inclusion of physicians in the federal social security law, with a substantial number favoring participation on a voluntary basis; therefore be it

Resolved, That the House of Delegates of the American Medical Association recommend to state societies that they make a similar survey to that conducted in Ohio, if they have not already done so, and that the results of the poll be transmitted to the Board of Trustees of the American Medical Association.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, read the following report, which was adopted:

Resolution No. 16: Your committee has given serious study to this resolution. In view of the various controversial questions which have arisen, the committee offers the following substitute resolution:

WHEREAS, Misunderstanding exists about the position of the medical profession on the question of the inclusion of physicians in the Old Age and Survivors Insurance provisions of the Social Security Act; therefore be it

Resolved, That the House of Delegates of the American Medical Association recommend to state societies that they poll their entire membership on this question, and that the results of the poll be transmitted to the Board of Trustees of the American Medical Association as soon as possible.

No. 17. Resolutions on Medical Representation on Voice of America

Dr. George W. Slagle, for the Michigan delegation, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, Health conditions in all other countries of the world affect the health of the people of Michigan; and

WHEREAS, The practice of medicine in Michigan is influenced by methods of practice in nations other than the United States; and

WHEREAS, The Voice of America can be a powerful influence to spread to all nations the health knowledge of American medicine and the advantages to patients and professions of the system of medical practice current in the United States today; and

WHEREAS, Expression of this health and medical information can be made best by representatives selected from the American medical profession; therefore be it

Resolved, That the American Medical Association request the Voice of America to include in its regular programs some programs prepared and presented by representatives of the American Medical Association; and be it further

Resolved, That the Board of Trustees of the American Medical Association be respectfully requested to defray the expenses and salaries involved in supplying personnel for the above purposes to the Voice of America.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, submitted the following report, which was adopted:

Resolution No. 17 on Medical Representation on Voice of America: Your committee recommends the adoption of this resolution, with the following changes: (1) That in the first and the second "Whereas" the words "the people of Michigan" be changed to read "the people of the United States," and that in the third "Whereas," after the words "The Voice of America," the following be inserted "and/or Radio Free Europe," and (2) that these same words be inserted in the first and the second "Resolved."

No. 18. Resolution on American Medical Association Study Committee on Highway Accidents

Dr. Clarence I. Owen, for the Michigan delegation, presented the following resolution, which was referred to the Reference Committee on Hygiene, Public Health, and Industrial Health:

Resolved, That the American Medical Association House of Delegates request the Board of Trustees to study the prevention of highway accidents.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, presented the following report, which was adopted:

Resolution No. 18 on American Medical Association Study Committee on Highway Accidents: Your reference committee approves Resolution No. 18.

No. 19. Resolution on National Regulation of Automobile Safety Standards

Dr. Clarence I. Owen, for the Michigan delegation, introduced the following resolution, which was referred to the Reference Committee on Hygiene, Public Health, and Industrial Health:

Whereas, Traffic accidents in the United States claim 38,000 lives and 1,250,000 injured each year, with a probable 45% increase in vehicle mileage in the next ten years; and

Whereas, This death and accident toll could be materially reduced through improvement in automotive safety design and construction; and

Whereas, All other modes of public transportation except that by automobile are already safeguarded by federal safety standards; therefore be it

Resolved, That the American Medical Association, through its House of Delegates, strongly urges the President of the United States to request legislation from Congress authorizing the appointment of a national body to approve and regulate safety standards of automobile construction.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, read the following report, which was adopted:

Resolution No. 19 on National Regulation of Automobile Safety Standards: Your committee approves Resolution No. 19 and recommends that it be referred to the present committee entitled, "Committee on Crash Injuries," its title being changed, however, to "Medical Aspects of Automobile Injuries and Deaths," *and your reference committee recommends that this* committee interest itself at once in this very important health problem.

No. 20. Resolutions on Report of Board of Trustees on Report of Committee on Medical Practices

Dr. John S. DeTar, for the Michigan delegation, introduced the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service:

Whereas, Action on the recommendation of the Board of Trustees concerning the report of the Committee on Medical Practices was postponed until this meeting, allowing all delegates an opportunity to study the report; therefore be it

Resolved, That the recommendations of the Board of Trustees be approved, with the following additional qualifications:

1. That the Council on Medical Service be instructed to continue its studies on professional services indices (relative value scales), utilizing as consultants representatives of the specialties, general practice, and the voluntary insurance plans;

2. That the American Medical Association communicate to the specialty boards *and to the specialty societies* the findings made by the Committee on Medical Practices, encouraging the boards and societies to reappraise the value of their regulations restrictive on the practice of those seeking or holding board certificates or specialty society memberships;

3. That the American Medical Association reaffirm the action of the House of Delegates of 1947 as follows: "It was never intended that staff appointments in hospitals generally, or even in hospitals approved for residencies, should be limited to board certified physicians, as is now the policy in some hospitals. Such policies, if practiced extensively, are detrimental to the health of the people and therefore to American Medicine. Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients as judged by the professional staff of the hospital and not on certification or special society membership";

4. And further, that the American Medical Association continue to use its full influence to discourage the arbitrary restriction by hospitals against general practitioners as a group, regardless of their qualifications as individuals, by (*a*) encouragement by the Council on Medical Education and Hospitals of departments of general practice in all general hospitals where practicable, and (*b*) approval of the expressed policy of the Joint Commission on Accreditation of Hospitals of hospital staff rules which permit to the generalist privileges in the departments of medicine, surgery, obstetrics, and pediatrics in accordance with his demonstrated ability; and be it further

Resolved, That a copy of this resolution be sent to the American College of Surgeons, the American College of Physicians, the American Academy of Pediatrics, the American Academy of Obstetrics and Gynecology, the American Academy of General Practice, the American Hospital Association, the Catholic Hospital Association, the American Protestant Hospital Association, and the chief of staff of every hospital in the United States and its territories.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

The report of the reference committee on Resolution No. 20 will be found following supplementary report F of the Board of Trustees on page 1652 of the Dec. 24, 1955, issue of The Journal.

No. 21. Resolution on Alphabetical Listing of Alaska and Hawaii in American Medical Association Publications

Dr. George W. Slagle, on behalf of the Michigan delegation, submitted the following resolution, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

Whereas, The Hawaii Medical Association will be 100 years old next year, having been incorporated in 1856 under the Hawaiian monarchy; and

Whereas, The Hawaii Medical Association has been a constituent association of the American Medical Association for half a century, having been represented in the House of Delegates at most sessions since 1904 and at all sessions since 1930; and

Whereas, Hawaii is an integral part of the United States of America, as shown by the fact that its residents are citizens and pay the federal income tax, and by a recent federal court decision holding that travel to Hawaii does not constitute travel outside the United States; and

Whereas, The District of Columbia is routinely listed in alphabetical sequence among the states in all publications and studies by the American Medical Association, while Hawaii is either omitted, or listed with "foreign countries" or "possessions," or at best brings up the rear, following Wyoming; and

Whereas, The Alaska Territorial Medical Association enjoys, in all respects except size, a status equivalent to that of Hawaii; now therefore be it

Resolved, That in all future studies or publications of the American Medical Association all constituent societies be listed in alphabetical order regardless of whether those societies are state or territorial.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Homer M. Izumi, Chairman, Hawaii, presented the following report, which was adopted:

Resolution No. 21 on Alphabetical Listing of Alaska and Hawaii in American Medical Association Publications: Your committee agrees that the listing in the American Medical Association publications should be in alphabetical order.

No. 22. Resolutions on Medical Society-Sponsored Voluntary Prepaid Medical Care Plans

Dr. Thomas J. Danaher, Connecticut, on behalf of the Connecticut delegation, Dr. Charles G. Hayden, Massachusetts, and the New Jersey delegation, introduced the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service:

Whereas, The participating and cooperating physicians of medical care plans sponsored by county, state, and local medical societies are making a valuable contribution in the public interest by furthering the development of voluntary prepaid medical care for the people of America; and

Whereas, More than 100,000 members of the American Medical Association are participating in physician-sponsored prepaid medical care plans; therefore be it

Resolved, That this House of Delegates commends these physicians and the medical society-sponsored plan in which they participate for the important services being rendered in health care for the American people; and be it further

Resolved, That the American Medical Association reaffirm its approval of medical society-sponsored nonprofit prepaid medical care plans as a means for financing medical care.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, which was adopted:

Resolution No. 22 on Medical Society-Sponsored Voluntary Prepaid Medical Care Plans: Your committee concurs in the objectives, philosophy, and mode of their expression in this resolution with the one exception that it is your committee's understanding that some commendation has been given formerly by the House of Delegates in the past. Therefore, the resolution is presented with the third "Whereas" deleted. Your committee also suggests that wherever the words "participating physicians" appear, they be amended to read, "participating and cooperating physicians." With these amendments the committee recommends that the resolution do pass.

No. 23. Resolutions on the Practice of Pathology

Dr. Clark Bailey, for the Kentucky delegation, introduced the following resolutions, which were referred to the Reference Committee on Medical Education and Hospitals:

WHEREAS, The American system of private practice of medicine has given us the highest health and medical standards in the world; and

WHEREAS, The American Medical Association has publicly declared its stand in favor of this system of private practice; and

WHEREAS, The practice of pathology including both clinical pathology and anatomic pathology has been regarded as the practice of medicine; and

WHEREAS, In certain states whose laws concerning the practice of medicine are similar to our own the attorneys general have officially interpreted the operation of laboratories, x-ray departments, and anesthesia departments by corporations such as hospitals as illegal and acceptance of salaries or commissions from such corporations by licensed practitioners of medicine as unethical fee splitting; and

WHEREAS, As a result of this interpretation an attempt is being made by certain lay groups to cause revision of the law or its interpretation to permit division of pathology into professional and technical service, the former being personal labor of the pathologist and therefore being the practice of medicine, the latter being the work of the technical assistants who perform under his direction and supervision and therefore not the practice of medicine and legally practiced by a hospital; and

WHEREAS, If this position should be sustained the practice of pathology and thus of all medicine would be in danger of being taken over piecemeal by nonmedical personnel and corporations to the detriment of both patients and physicians; and

WHEREAS, As early as 1943 the American Medical Association studied this problem and stated that the "House of Delegates of the American Medical Association is opposed to the division of any branch of medical practice into so-called technical and professional factions," and also that "the practice of anesthesiology, pathology, physical medicine, and radiology are an integral part of the practice of surgery, internal medicine, or any other designated field of medicine"; therefore be it

Resolved, That the House of Delegates of the Kentucky State Medical Association is opposed to the division of any branch of medical practice into so-called technical and professional factions and furthermore instructs its delegates to the American Medical Association to maintain this position; and be it further

Resolved, That because of the confusion existing in many states in regard to this question, that the House of Delegates of the American Medical Association reaffirm its position taken in 1943.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George M. Fister, Chairman, Utah, read the following report, which was adopted:

Your reference committee has reviewed resolution No. 23 submitted by the Kentucky delegation in regard to its resolution on the practice of pathology. Your reference committee agrees with the intent of the resolution but for purposes of clarity would like to recommend its adoption in amended form. Your committee is, therefore, suggesting that the resolution be worded as follows:

WHEREAS, The American system of private practice of medicine has given us the highest health and medical standards in the world; and

WHEREAS, The American Medical Association has publicly declared its stand in favor of this system of private practice; and

WHEREAS, The practice of pathology, including both clinical and anatomic pathology, is the practice of medicine; and

WHEREAS, In many states the attorneys general have written opinions stating that the operation of laboratories and departments of radiology and anesthesia by corporations, including hospitals, is illegal, and that the acceptance of employment from such corporations by a licensed practitioner of medicine under terms permitting the corporation to charge a fee for his services is unethical fee splitting and illegal; and

WHEREAS, As a result of such interpretations attempts are being made by certain lay groups to amend the laws, or their interpretations, to permit the division of pathology into professional and technical services, the latter to be the work of the pathologist's technical assistants who perform under his direction and supervision and not to be considered the practice of medicine and, therefore, services which may be legally performed by a hospital; and

WHEREAS, If this position should be sustained, fragmentation of the practice of pathology would be accomplished and thus all medicine would be in danger of being so divided to the detriment of the patient; and

WHEREAS, As early as 1943 the American Medical Association studied this problem and stated that the "House of Delegates of the American Medical Association is opposed to the division of any branch of medical practice into so-called technical and professional factions," and later, in 1951, that "the practice of anesthesiology, pathology, physical medicine, and radiology are an integral part of the practice of medicine in the same category as the practice of surgery, internal medicine, or any other designated field of medicine"; therefore be it

Resolved, That the House of Delegates of the American Medical Association is opposed to the division of any branch of medical practice into so-called technical and professional services; and be it further

Resolved, That because of the confusion existing in some states in regard to this question this House of Delegates reaffirm the position taken in 1943 and 1951.

Nos. 24 and 25

Dr. Clark Bailey, on behalf of the Kentucky delegation, introduced the two following resolutions, Nos. 24 and 25, which were referred to the Reference Committee on Medical Education and Hospitals:

No. 24. Resolution on Present Standards as Prescribed by Joint Commission on Accreditation of Hospitals

WHEREAS, The individual and private practice of medicine has raised American Medicine to its present high level envied by all nations; and

WHEREAS, Any system which deprives any doctor, hospital, or groups of doctors or hospitals of their initiative will result in lowered standards of medical care; and

WHEREAS, Any organization or groups of organizations which dictate standardization on a national level without adequate consideration of varying local problems results in the deprivation of said initiative; and

WHEREAS, The establishment of such standards to be met on a national scale should only be arrived at by the collective opinions of the individual hospitals and doctors involved; and

WHEREAS, The present standards, as prescribed by the Joint Commission on Accreditation of Hospitals, have been arrived at by autocratic rather than by democratic methods; and

WHEREAS, This autocratic system does not take into consideration the local, economic, and medical factors of each hospital, which may be different depending on the type, size, degree of departmentalization, and financial resources, etc.; and

WHEREAS, Impractical standards for hospitals have already increased the cost of hospital care and will continue to increase hospital costs with no resulting benefit to the patient; and

WHEREAS, The private practice of medicine is striving to lower hospital costs to patients and to increase voluntary prepaid hospitalization insurance at a premium which can be afforded by all income groups; and

WHEREAS, Requirements of the Joint Commission on Accreditation of Hospitals cause a definite increase in all hospitalization costs by demanding unnecessary routine laboratory procedures and additional administrative costs; and

WHEREAS, The medical profession is constantly being burdened by more and more rules and regulations; and

WHEREAS, These various rules and regulations cause more and more time to be spent at various and sundry unnecessary meetings; and

WHEREAS, These various meetings tend to separate the medical profession into various hospital groups to the detriment of the unity and strength of county and state medical societies, which are the backbone of American medicine; and

WHEREAS, This disunity, increased cost of medical care, and possible breakdown of prepaid voluntary health insurance plans open the way to regimentation and governmental control of the practice of medicine; and

WHEREAS, The inspections done in the past have frequently been made by personnel of the Joint Commission on Acreditation of Hospitals unfamiliar with the private practice of medicine; and

WHEREAS, The results of inspection have obviously been discriminatory in many respects; and

WHEREAS, Many of the criticisms offered by inspectors in individual instances have indicated obvious prejudice and lack of thorough understanding of the local situation; and

WHEREAS, The Campbell-Kenton Counties Medical Society of Kentucky, feels keenly its responsibility for the health needs of the people of our community and all communities and is ever alert and anxious to institute and promote methods and practices which will better accomplish this purpose; and

Whereas, The Campbell-Kenton Counties Medical Society of Kentucky strongly feels that the methods of the Joint Commission on Accreditation of Hospitals have failed to promote these ideals; and

Whereas, The Kentucky State Medical Association now goes on record as vigorously opposing the present system, methods of operation, and standards of the Joint Commission on Accreditation of Hospitals; therefore be it

Resolved, That the delegates from Kentucky to the American Medical Association present this resolution to the House of Delegates of the American Medical Association at its next meeting and work vigorously for the adoption of this resolution.

No. 25. Resolution on Opposition to Policy of Joint Commission on Accreditation of Hospitals in Limiting Number of Courtesy Staff Memberships in Private General Hospitals

Whereas, Local traditions and usages have made good medical care often contingent on each physician having staff privileges in two or more hospitals; and

Whereas, Pressure is currently being applied by the Joint Commission on Accreditation of Hospitals to cause local private hospitals to limit the number of physicians who may hold courtesy staff privileges; and

Whereas, This policy seems to connote a disregard of the patient's choice in hospitals and creates a community problem; and

Whereas, The House of Delegates of the Kentucky State Medical Association expresses opposition to the policy of the Joint Commission on Accreditation of Hospitals regarding the number of courtesy staff memberships in private general hospitals; therefore be it

Resolved, That the Kentucky delegates to the American Medical Association be instructed by this resolution to represent members of the Kentucky State Medical Association as being opposed to this policy at the next meeting of the House of Delegates of the American Medical Association.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George M. Fister, Chairman, Utah, presented the following report, which was adopted:

Your reference committee has reviewed Resolution No. 24, submitted by the Kentucky delegation, on the present standards as prescribed by the Joint Commission on Accreditation of Hospitals, and Resolution No. 25, also submitted by the Kentucky delegation, dealing with opposition to the policy of the Joint Commission in limiting the number of courtesy staff members in private hospitals. These two resolutions, in the opinion of your reference committee, fall within the area of study which is now being made by the special committee which has been appointed to study the activities of the Joint Commission on Accreditation of Hospitals. Your reference committee recommends that no action be taken on these resolutions at this time and that they be referred to the special committee now studying similar problems with the request that they report on them at the June meeting in 1956.

No. 26. Resolution on Guiding Principles Recommended by Committee on Medical Care for Industrial Workers

Dr. Clark Bailey, for the Kentucky delegation, introduced the following resolution, which was referred to the Reference Committee on Insurance and Medical Service:

Whereas, Guiding Principles in regard to health center plans were recommended by the *Committee on Medical Care for Industrial Workers* of the Councils on Medical Service and Industrial Health and printed in The Journal following the last annual meeting in Atlantic City; and

Whereas, These Guiding Principles will be an order of business for adoption before the American Medical Association House of Delegates; and

Whereas, The house of delegates of the Kentucky State Medical Association recommends the deletion of the term "Joint Commission on *Accreditation of Hospitals*," *from* Section VI (C); and

Whereas, The house of delegates of the Kentucky State Medical Association recommends "the rewriting of Section X, public and community relations, of the same report to remove the ambiguity in this section, relative to the free choice of physicians"; and

Whereas, A special committee was authorized by the American Medical Association House of Delegates at the 1955 Atlantic City meeting to study the functions of the Joint Commission on Accreditation of Hospitals and the adoption of the aforenamed principles would be presumptuous and precocious; therefore be it

Resolved, That the House of Delegates of the American Medical Association be asked to accomplish the deletion and rewriting of the paragraphs referred to above as requested by the house of delegates of the Kentucky State Medical Association in the interest of better medical practice.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, which was adopted:

Resolution No. 26 and Guiding Principles for Evaluating Management and Union Health Centers: Your reference committee considered Resolution No. 26 in connection with the item entitled, "Guiding Principles for Evaluating Management and Union Health Centers contained in the report of the Council on Medical Service.

Special attention is directed to this subject, which drew considerable discussion from a number of interested parties. This discussion resulted in almost complete approval when Section X was amended in accordance with suggestions made by the Kentucky delegation and when Section VI (C) was deleted. At present Section X reads as follows:

> X. Public and Community Relations—There are many social, public health, and welfare agencies, both public and voluntary, concerned with the health and well being of local citizens. It is the responsibility of health center personnel to maintain good and effective relations with the staffs of such organizations. It is, therefore, of the greatest importance that persons eligible to participate in the health center's program know that they are free to seek medical care from whomsoever and wheresoever they wish. They should be made aware, however, that unless management or health center programs provide for the payment of such services, they are not obligated to contribute to the payment of services obtained *outside* of *their* medical program.
>
> Finally, to the extent that these guiding principles are observed, the medical profession will improve the quality of medical care accorded the patient and the community.

This has been amended to read: "As one aspect of this responsibility the health center is urged to provide, insofar as possible, a free choice of medical service to the patient it serves. When service outside a specific center facility cannot be paid for under the terms of the plan, patients should be informed that they are privileged to obtain such services as they wish outside the center at their own expense."

Section VI (C) which is to be deleted, reads as follows: "The basic requirements established for all approved hospitals and outpatient departments according to the criteria of the Joint Commission for Accreditation of Hospitals should apply to the medical staffs of agencies serving this field."

No. 27. Resolution on Rehabilitation Consultation Service

Dr. Hugh H. Hussey, District of Columbia, introduced the following resolution, which was referred to the Reference Committee on Hygiene, Public Health, and Industrial Health:

Whereas, The handicapped person looks to the medical profession for treatment to restore him or her to a status of work ability or self-help; and

Whereas, There are few facilities in the United States which miantain a complete restoration program for the disabled; and

Whereas, Numerous lay-sponsored and lay-supported agencies supply partial restorative facilities manned for the most part by personnel having little or no medical supervision; and

Whereas, Teaching and training programs in these facilities can give instruction only in limited areas of rehabilitation; and

Whereas, Rehabilitation is a broad concept involving the integrated use of multiple disciplines, including medicine, education, counseling, job placement, and *others in which medicine should logically* accept the over-all responsibility for the general program and to the handicapped individual; and

Whereas, There is no organized service or policy now existing in the program of the American Medical Association; therefore be it

Resolved, That the House of Delegates of the American Medical Association establish an integrated consultation service to state societies and outline a policy of procedure for the guidance of local professional groups in dealing with the total program of rehabilitation.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, submitted the following report, which was adopted:

Resolution No. 27 on Rehabilitation Consultation Service: Your committee approves Resolution No. 27 in principle and believes the medical profession should take a leading part in this project.

No. 28. Resolutions on General Practice

Dr. Kenneth C. Sawyer, Colorado, presented the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service:

WHEREAS, The preservation of the general practice of medicine is considered to be in the interests of comprehensive medical care; and

WHEREAS, Access to hospital facilities is considered to be an absolute necessity for the good practice of medicine; and

WHEREAS, The trend toward specialization has advanced to an extent which jeopardizes the supply of generalists in the foreseeable future; and

WHEREAS, It is the duty of the American Medical Association to assume an active role in all matters affecting the medical care of the American people; therefore be it

Resolved, That the American Medical Association approve of the medical school teaching programs which afford the medical student opportunity for experience in the general practice of medicine; and be it further

Resolved, That the Council on Medical Education and Hospitals be directed to utilize all possible means to stimulate the formation of a department of general practice in each medical school; and be it further

Resolved, That the Council on Medical Education and Hospitals be directed to develop and utilize all means to implement, improve, and extend the two-year general practice internship-residency program; and be it further

Resolved, That the American Medical Association condemn hospital staff policies which exclude or arbitrarily restrict the general practitioner from hospital privileges essential for the general practice of medicine; and be it further

Resolved, That the American Medical Association approve hospital staff rules which permit the generalist staff privileges in the departments of medicine, pediatrics, obstetrics, and surgery in accordance with his demonstrated professional competence and experience; and be it further

Resolved, That the Council on Medical Education and Hospitals be instructed to implement this policy by whatever means necessary; and be it further

Resolved, That the representatives of the American Medical Association on the Joint Commission on Accreditation of Hospitals be instructed to stimulate action by that body leading to the warning, provisional accreditation or removal of accreditation of community or general hospitals which exclude or arbitrarily restrict hospital privileges for generalists as a class regardless of their individual professional competence, after appeal to the Commission by the county medical society concerned; and be it further

Resolved, That a copy of this resolution be sent to the dean of each medical school, the American College of Surgeons, the American College of Physicians, the American Academy of Pediatrics, the American Academy of Obstetrics and Gynecology, the American Academy of General Practice, the American Hospital Association, the Catholic Hospital Association, the American Protestant Hospital Association, and the chief of staff of every hospital in the United States and its territories.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

The report of the reference committee on Resolution No. 28 will be found following supplementary report F of the Board of Trustees on page 1652 of the Dec. 24, 1955, issue of THE JOURNAL.

No. 29.—Resolution on Federal Subsidy for Medical Education

Dr. Joseph B. Copeland, for the Texas delegation, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

Preamble: In spite of the fact that more doctors of medicine are now being graduated from the 80 medical schools in the United States than ever before, with acknowledged highest standards of training and without definite federal subsidy, S. 1323 now pending before the 84th Congress with an appropriation of $250,000,000 would clearly launch a program of federal subsidy for medical education. The American Medical Association has consistently held the opinion that federal aid is a "dangerous device because of the degree of regulation which must necessarily accompany federal funds." Under the provisions of S. 1323 the federal government would have the legal right to subsidize the cost of maintenance of the new facilities built under its provisions by allowing the applicant to set aside 20 per cent of the federal grant for "permanent endowment." Past experience has shown that the stipulations of a "temporary emergency" and "single grant" offer no protection against perpetuation, since the same philosophy was incorporated in the Hill-Burton laws which have been extended recently to 1957. Therefore, be it

Resolved, That it is the opinion of this House of Delegates that said S. 1323 represents a definite step toward the socialization of medical education and practice in this country and therefore should be rejected by the Congress; and be it further

Resolved, That copies of this resolution be sent to all members of the Senate and House of Representatives of the 84th Congress.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, read the following report, which was adopted:

Resolution No. 29 on Federal Subsidy for Medical Education: This resolution, on S. 1323, runs contrary to the position of the American Medical Association, as reported by the Committee on Legislation. Your reference committee therefore recommends that this resolution be not approved.

No. 30. Resolutions on Appointment of Special Commission to Review the Social Security System

Dr. Joseph B. Copeland, on behalf of the Texas Medical Association, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

Preamble: It is a publicly acknowledged fact and a matter of record that H. R. 7225 of the 84th Congress was passed out of the House Ways and Means Committee without public hearings, without independent actuarial consultation, and against the recommendation of the Department of Health, Education, and Welfare and was passed by the House under a suspension of the rules which prevented adequate debate. It is also apparent that no adequate study or review of the Social Security system has been made by Congress, that very few citizens have any real insight into the legal provisions of the Social Security law and amendments, and that no readily available report has ever been made of the present status of the so-called "Trust Fund" nor of the potential eventual cost of payments as now planned for citizens participating in the Social Security plan. Good business principles and justice would indicate that a very painstaking and openly-reported study should be made of the entire Social Security system before any more changes are made in it. The Senate of the 84th Congress will be having hearings on H. R. 7225 early in 1956; now therefore be it

Resolved, By the House of Delegates of the American Medical Association that we urge the Congress to withhold action on H. R. 7225 and to provide for the appointment of a comprehensive Commission to Review the Social Security System and to report back to Congress and the nation after an adequate study; and be it further

Resolved, That copies of this resolution be sent to the President of the United States and members of his Cabinet, to all members of the 84th Congress, and to all constituent state medical associations.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

The report of the reference committee on Resolution No. 30 will be found following supplementary report B of the Board of Trustees on page 1650 of the Dec. 24, 1955, issue of THE JOURNAL.

No. 31. Resolution on Commendation to Physicians of Iowa

Dr. Percy E. Hopkins, Illinois, introduced on behalf of the Illinois, Colorado, Wisconsin, and Louisiana delegations, the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The physicians of Iowa have for the past year been engaged in supporting the position that the practice of medicine is the right of the individual; and

WHEREAS, A decision rendered by a District Court of the state of Iowa upheld this position; and

WHEREAS, This decision is expected to have a far-reaching effect on the practice of medicine throughout the nation; therefore be it

Resolved, That the House of Delegates of the American Medical Association congratulate the physicians of Iowa on the successful outcome of the initial phase of this action, and commends them for the able way in which they presented the position of the American medical profession.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, presented the following report, which was adopted unanimously:

Resolution No. 31 on Commendation to Physicians of Iowa: Your reference committee is in complete accord with this resolution recommending that the House congratulate the physicians of Iowa on the successful outcome of the initial phase of its action in supporting the position that the practice of medicine is the right of the individual. Your committee notes with gratification the decision of the judge in this case, which is in full support of the contentions of the physicians involved. Your committee recommends the adoption of this resolution with expressions of appreciation to the many physicians of Iowa who have labored so industriously in support of the rights of our profession.

No. 32. Resolutions on Chamber of Councillors to American Medicine

Dr. Russel V. Lee, Section on Military Medicine, introduced the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, American medicine has been and is deprived of the wise council of certain distinguished physicians whose professional activities have precluded their participation in organized medical affairs; and

WHEREAS, It is desirable that a means be provided whereby the American Medical Association may confer honor upon and official recognition to those physicians who have made great contributions to American medicine and American life; and

WHEREAS, The American Medical Association recognizes that various groups in this country have a vital and increasing interest in health and medical affairs and consequently desire and deserve a voice in the councils of American medicine not presently available to them; therefore be it

Resolved, That the House of Delegates of the American Medical Association hereby set up a special study committee, appointed by the chair, to consider and report to the next annual meeting on methods and means for the establishment of a Chamber of Councillors to American Medicine; and be it further

Resolved, That this study committee be instructed that the objectives of the establishment of this Chamber are: (1) to provide American medicine with a permanent council of advisors, physicians distinguished by attainments and integrity, who shall at appropriate intervals submit a report and recommendations to the House of Delegates of the American Medical Association; (2) to provide a means whereby recognition and honor may be conferred on those who have earned it; and (3) to furnish a forum where those groups that have real and legitimate interests in health affairs may express themselves; and be it further

Resolved, That the study committee be further instructed to consider the method of nomination and election to this Chamber, bearing in mind the primary purpose of including in it the most distinguished physicians of the country and those deserving of honor, and the secondary objective providing representation to such groups as farmers, laborers, industrialists, educators, insurance men, and others who truly have an interest in health affairs; and be it further

Resolved, That the committee furthermore be asked to make recommendations for the constitution and governing of the Chamber, means for its support, and any other matters which the committee deems pertinent to the objective of establishing a Chamber of Councillors to American Medicine.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Frank H. Krusen, Chairman, Section on Physical Medicine, read the following report, which was adopted:

Resolution No. 32 on Chamber of Councillors to American Medicine: Your reference committee reviewed this recommendation that a special study committee be appointed to consider the establishment of a Chamber of Councillors to American Medicine. It is believed that there is some merit to this proposal; however, it is also evident that the American Medical Association has already provided certain means of acknowledging the contributions to medicine of outstanding leaders. Your reference committee recommends that this resolution be referred to the Board of Trustees for consideration.

No. 33. Resolutions on Recognition of General Practitioners in Hospitals

Dr. James M. Kolb, Arkansas, introduced the following resolutions, which were referred to the Reference Committee on Medical Education and Hospitals:

WHEREAS, In certain hospitals in this country there is discrimination against the general practitioner; and

WHEREAS, The generalists or general practitioners of medicine in this country render most of the medical care to the American people; therefore be it

Resolved, That the American Medical Association through its Council on Medical Education and Hospitals encourage hospital staff rules which permit the general practitioner staff member privileges in the specialty departments in keeping with his merit and demonstrated ability; and be it further

Resolved, That the American Medical Association instruct its representatives on the Joint Commission on Accreditaiton of Hospitals to seek the adoption of the above recommendation by that body.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George M. Fister, Chairman, Utah, submitted the following report, which was adopted:

Your reference committee reviewed Resolution No. 33 on Recognition of General Practitioners in Hospitals presented by the Arkansas delegation. Your reference committee is in agreement with the intent of this resolution that the American Medical Association through its Council on Medical Education and Hospitals encourage hospital staff rules which permit the general practitioner staff member privileges in the specialty departments in keeping with his merit and demonstrated ability, and recommends the adoption of this resolution.

No. 34. Resolution on Policies of American Medical Association on Matters Related to the Environment of Medicine

Dr. Joseph B. Copeland, for the Texas delegation, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Preamble: Physicians should accept their responsibilities as citizens first. This gives them the privilege and the obligation of taking a stand publicly on matters that involve the environment of medicine and the free enterprise system, all having to do with the public interest and the principles of government on which this country was founded; therefore be it

Resolved, That it is the intention of the House of Delegates of the American Medical Association that this House, the officers, and the proper councils and committees of the American Medical Association, acting in their respective capacities, always should feel free to express publicly the attitude of this Association on matters which involve the environment of medicine and the principles of free enterprise.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Paul A. Davis, Chairman, Ohio, presented the following report, which was adopted:

Resolution No. 34 on Policies of the American Medical Association on Matters Related to the Environment of Medicine: Your committee recommends the adoption of this resolution.

No. 35. Resolution on Cash Disability Benefits in H. R. 7225

Dr. Joseph B. Copeland, for the Texas delegation, introduced the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Preamble: The Social Security amendments proposed by H. R. 7225, now pending before Congress of the United States, provide the payment of cash benefits to the "totally and permanently disabled" at age 50 instead of the present age 65. Besides creating an enormous expense estimated at $250,000,000 for the first year, such a proposal very definitely would lead to an encroachment on the private practice of medicine, placing one more segment of medical care under the jurisdiction of the federal government and posing a definite threat to the effectiveness of present rehabilitation programs. The proposal represents another step in the master plan for the nationalization of medicine; now therefore be it

Resolved, That the House of Delegates of the American Medical Association expresses its disapproval of this specific proposal in H. R. 7225 which would provide the payment of cash benefits to the "totally and permanently disabled" at age 50, and calls upon Congress to defeat this legislation.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

The report of the reference committee on Resolution No. 35 will be found following supplementary report B of the Board of Trustees on page 1650 of the Dec. 24, 1955, issue of THE JOURNAL.

No. 36. Resolutions on Blue Shield Prepayment Health Insurance

Dr. L. Howard Schriver, Ohio, introduced the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service:

WHEREAS, By action of the House of Delegates at the interim meeting in Cleveland, December, 1945, the Board of Trustees of the American Medical Association was requested to proceed with investigation and formation of a national organization to provide and serve the American people with prepayment health protection; and

WHEREAS, The Board of Trustees very promptly, through the Council on Medical Service, did proceed to implement the request of the House of Delegates; and

WHEREAS, In March, 1946, in St. Louis, the Council on Medical Service by its request met with nine representatvies of nonprofit voluntary professionally-sponsored prepayment plans; and

WHEREAS, The Associated Medical Care Plans was formed at that meeting; and

WHEREAS, At the time Associated Medical Care Plans was formed it consisted of nine plans, and the total number of people insured by all existing plans was approximately two million. This organization has grown to 77 plans servicing 44 States and the territories of Puerto Rico and Hawaii, affording prepayment health protection to 33 million people; and

WHEREAS, This is definite evidence of acceptability and confidence of the American people in this type of protection; and

WHEREAS, With actuarial experience, progressive extension and liberalization of protection has been afforded the subscriber; and

WHEREAS, Blue Shield contracts have the minimum of exclusions and waiting periods and no cancellation by the plan of subscriber protection, irrespective of utilization; and

WHEREAS, Blue Shield Plans are sponsored by either state or county medical societies which are component units of the American Medical Association; and

WHEREAS, The services to subscribers are underwritten by an overwhelming majority of the medical profession in the United States and in the territories of Puerto Rico and Hawaii; therefore be it

Resolved, That this House of Delegates approves the actions and accomplishments of the Blue Shield Association of Medical Care Plans; and be it further

Resolved, That this House of Delegates commends professionally-sponsored nonprofit health insurance to the American public.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Lewis A. Alesen, Chairman, California, read the following report, which was adopted:

Resolution No. 36 on Blue Shield Prepayment Health Insurance: The discussion on this resolution was unanimously in favor of its passage with the addition of "as a means of financing medical care" to the last "resolved," and with the amendment of the eighth "whereas" to read as follows: "Whereas, Blue Shield contracts have the minimum of (1) exclusions, (2) waiting periods, and (3) cancellation by the plans of subscriber protection, irrespective of utilization; and" Your committee recommends adoption of this resolution with the amendments.

No. 37. Resolution on Dr. Creighton Barker

Dr. Stanley B. Weld, for the Connecticut delegation, introduced the following resolution, which was adopted by a unanimous rising vote:

WHEREAS, Dr. Creighton Barker, Executive Secretary of the Connecticut State Medical Society, has had the misfortune to sustain various and sundry injuries, which it is hoped may not prove serious, as the result of an automobile head-on collision; and

WHEREAS, Dr. Barker is still confined to bed in the Grace-New Haven Community Hospital; and

WHEREAS, Due to this accident Dr. Barker has been obliged to miss these sessions of the American Medical Association now being held in Boston and to forfeit his place on the panel program planned as part of the Scientific Assembly; therefore be it

Resolved, That the House of Delegates of the American Medical Association herein assembled express to Dr. Barker its deep regret that he is thus disabled and wish for him a speedy recovery.

No. 38

The speaker announced that Resolution No. 38, which was to have been introduced for the Texas delegation, had been withdrawn.

No. 39. Resolution on Illness of Dr. Edward R. Cunniffe

Dr. Floyd S. Winslow, on behalf of the New York delegation, and with the unanimous consent of the House, introduced the following resolution, which was adopted unanimously:

WHEREAS, A message has been received that Dr. Edward R. Cunniffe, for many years Chairman of the Judicial Council of the American Medical Association, is seriously ill; therefore be it

Resolved, That the Secretary of the American Medical Association is hereby requested to express to Dr. Cunniffe's family the regret of the members of this Association for his illness and their earnest hope for his speedy recovery.

SPECIAL REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. L. Howard Schriver, Chairman, Ohio, presented the following special report and moved that it be adopted and a copy sent to Dr. Peterson's family. The report was adopted by a unanimous rising vote.

MEMORIAL ON DEATH OF DR. CARL M. PETERSON

The House of Delegates notes with sorrow the untimely death on Sept. 27, 1955, of Dr. Carl Melancton Peterson, Secretary of the Council on Industrial Health of the American Medical Association. While traveling from a meeting of his Council to a conference in a distant city, Carl Peterson sustained injuries in an airplane accident from which he did not recover.

Carl Peterson had served the American Medical Association diligently and faithfully for 25 years. He had been the Secretary of the Council on Industrial Health since its inception 17 years ago. During these years his untiring efforts in carrying on the work of the Council and the medical profession gained for him an affectionate esteem which men garner when they demonstrate the kind of understanding, professional guidance, and leadership which Carl Peterson possessed. He moved among us in a quiet, unassuming yet confident manner which bespoke faith in his fellow physicians, understanding of the relationship of the physician and his patient, vision in the role of industrial medicine, and unswerving devotion to the fulfillment of those goals to which all of us are dedicated.

In the words of one who knew him well, "The world is a better place because he lived in it."

Messages of Condolence

Dr. R. A. Benson, Washington, informed the House of the recent illness of Dr. Raymond L. Zech, a member of the House of Delegates for a good many years, and moved that the House extend to Dr. Zech its appreciation for the work he has done and encouragement in his recovery. The motion was adopted unanimously.

Dr. Rutherford T. Johnstone, Section on Preventive and Industrial Medicine and Public Health, moved that the House of Delegates stand in silence for one moment in memoriam to Dr. Carl M. Peterson. The House rose in silent response.

Dr. Warren W. Furey, Illinois, for the Council on Constitution and Bylaws, requested the House to take recognition of the unavoidable absence of Dr. Louis A. Buie, Chairman of the Council, by asking the Secretary to send him a fitting telegram. The request was concurred in unanimously.

Dr. Carlton E. Wertz, New York, moved that the Secretary write an appropriate letter to the President of the United States on his recovery, and the motion was unanimously adopted.

Dr. Clarence I. Owen, Michigan, requested by motion that a telegram be sent to Dr. Wyman D. Barrett, a long-time delegate from Michigan, who is ill and unable to attend the Boston meeting. The motion was adopted unanimously.

Telegram from Dr. Wyman D. Barrett

The Speaker read to the House of Delegates the following telegram received from Dr. Wyman D. Barrett:

Many thanks to your officers, yourself, and all the delegates. Extremely sorry unable to be present. Know you will have an excellent meeting.

Reports from Student A. M. A. Delegates

Mr. Hugh Follmer, Student A. M. A. delegate, addressed the House as follows:

Mr. Speaker, Members of the House of Delegates, and Guests: It is indeed an honor to be present for the meeting of the House of Delegates and the meetings of the reference committees. The representatives from the Student American Medical Association always appreciate being here and enjoy their stay immensely. The last two days we have met many, many of the delegates. We are sorry that we could not meet everybody. We have found in discussions with the different members from the various states that many of them would like to know more about our organization, and because of this we would like briefly to run through some of the work we have done and explain very briefly what our interests are.

Our interests start with premedical education. We have a committee that is studying the question of premedical advisers. The question has arisen as to how good the premedical counseling is for men before they get to medical school, not only as to where to go to medical school and how to get into medical school but also what to take as an undergraduate. This committee is trying to gather information on premedical advising systems in the various states and schools, and we want to make available to all of our local chapters all the information we can on these entrants. We are especially interested in the fact that many, many of the premedical advisers are not M.D.'s; they are Ph.D.'s in chemistry, zoology, and so forth. We feel it is important that premedical students be advised by men who are in the profession themselves and who have better insight into what a man should take as a premedical student.

Our interests also fall into the medical school itself. We are interested in two things. We are interested in how the student finances his way through the medical school, and Mr. Wilson will cover that phase. We are also very interested in the curriculums of medical schools. We, in several of our chapters, have curriculum evaluations, and are gathering information on these evaluations so that this information may be passed out to all of our local chapters so that they may do a curriculum evaluation of their own.

When we speak about a curriculum evaluation, we are not speaking of which course should be in the curriculum and what course should not be in the curriculum. We are not evaluating the professors *per se*. We usually try to put our attention on the little parts course. It is very evident as you go along through medical school that every once in a while there is one course in which there is a great big hole. The professor does not realize it, the curriculum committees and often the students do realize it, and it is only from this that the information can be gained so that the professors can fill up this hole of knowledge. In several schools the professors have been very grateful for such evaluation, and we hope to continue it.

Naturally, being medical students, we are all interested in our internship. The SAMA has had a committee studying for two years the internship in its entirety. On the local level, we carry out a questionnaire program; it is an evaluation. These questionnaires are sent to all of the graduates from the school in the last year. They evaluate their internship very, very thoroughly, and these questionnaires are returned to the local chapter. It is a national program, but the information is not gathered nationally. The information is available to anybody who would care to write any of the local chapters. I know of no questionnaire which will answer more questions for a medical student about any particular internship, and many, many men have used these questionnaires before they start out to visit individual hospitals, and it helps them in selecting which hospitals they will visit. We have studied internships on a national level, the question of what is an internship, and our committee has passed a resolution which wholeheartedly approves the Essentials of an Approved Internship, which is before the House now, but we feel that the internship is a training program and we are encouraging training of the intern.

There has also been the question before our house of delegates, which is only natural I believe, as to the stipend paid interns, and I am sure you are all aware that most interns feel that they are underpaid. I am sure you gentlemen all felt that way when you were interns. We have passed a resolution in our house congratulating any hospital which pays its interns more than $100 a month plus board, room, and laundry, the reason for this being that interns find it is almost impossible to live on less than that amount of money, one of the main reasons for this being that a very high percentage of interns are married. As a matter of fact, the intern who is not married is almost an oddity in this day and age.

We have many, many other interests. One of our primary interests is to educate medical students in the ways of organized medicine. Along this line we have participated in the medicolegal symposiums that were held last month. We were very happy to be invited to this event. We feel that it is not only important but is a part of medical education that is often neglected, and, as I have expressed to many men, I would like to see all SAMA members invited to such things if there is enough room for them. That seems to be the primary problem usually, to get all the students in, but we like to see students come to this type of meeting because we feel they can learn more there than any other place.

Once again I want to thank you for your attention and for the wonderful hospitality.

Mr. Harry Wilson, Student A. M. A. delegate, addressed the House with the following remarks:

Mr. Speaker, Members of the House and Guests: Since last June and our last report to you, one of the fondest hopes of SAMA has become a reality. This has been the establishment of the SAMA Foundation. The Foundation has been created through a trust agreement as a charitable and educational, nonprofit corporation. It is intended that the principal object and purpose of the Foundation shall be to provide financial assistance to medical students. The loan shall be available to any medical student having successfully completed his first year of medical education. There shall be required no co-signers or endorsers or collateral to obtain these loans. There is a very low interest rate scale, which is graded, and the maximum tenure of the loans shall be until six years after the calculated date of graduation. This fund was only initiated after research was done to evaluate the need for such a fund on the national level, and we feel that there is definitely a need for loans to be available to medical students on a national level, and that it is a great advantage to get this on a national level. The local selection committees in each medical school will review loan applications and submit their recommendations to a National Selection Committee for final action.

Our promotion initiating this Foundation will be directed primarily toward the encouragement of the premedical student and the high school student to enter the field of medicine with some knowledge ahead of time about the financial obligations involved. We hope that this Loan Foundation will encourage him to be more secure to enter the study of medicine.

Finally, I do not want to miss this opportunity to reemphasize the importance of the cooperation of the state and county medical societies with your Student American Medical Association chapters in your states. One opinion that has been expressed to us more often while we have been here at this meeting than any other is that many of your members wish that a Student A. M. A. had been in existence when they were going through medical school. I think this is a very important point, and it should not be overlooked. Many of the problems that we feel, just coming into this realm of the American Medical Association and organized medicine, when we see them from an objective viewpoint really, because we are not yet involved in them directly, we realize would have been smoothed out long, long ago if the exposure to organized medicine in the beginning had been more thorough and doctors could evaluate it when they first went into their medical societies at the county and state levels and then finally when they come to be represented here.

Once again, I thank you very, very much for the honor and privilege of being here and having had an opportunity to speak to you at this meeting.

Contribution to American Medical Education Foundation

Dr. George M. Fister, Utah, on behalf of the physicians of the State of Utah, presented to the American Medical Education Foundation checks totaling approximately $11,000.

SUPPLEMENTARY REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

In the absence of Dr. George M. Fister, Chairman, Dr. Warde B. Allan, Maryland, member of the reference committee, read the following supplementary report, which was adopted:

Through an oversight that was called to your committee's attention, we did not specifically accept the supplementary report R of the Board of Trustees, which requested and recommended that a smaller committee of nine members instead of eleven be composed of two members of the Board, et cetera, and, as a supplementary report of the Reference Committee on Medical Education and Hospitals, the acceptance of this report is recommended.

Retiring Delegates

The Speaker announced that several members of the House of Delegates were voluntarily retiring and would not serve as delegates after this session. He introduced Dr. Karl S. J. Hohlen, Nebraska, a delegate for 17 years who has never missed a meeting; Dr. Bruce Underwood, Kentucky, who is also secretary of the Kentucky State Medical Association; Dr. A. A. Brindley, Ohio; Dr. B. O. Edwards, North Carolina; and Dr. George A. Unfug, Colorado.

Dr. Woodruff L. Crawford, Section on Pediatrics, stated that Dr. Homer M. Izumi, Hawaii, is retiring; Dr. Willis H. Huron, Michigan, brought up the name of Dr. Ralph A. Johnson, Michigan, also voluntarily retiring; and Dr. Grover C. Penberthy, Section on Surgery, General and Abdominal, announced that Dr. Russel V. Lee, Section on Military Medicine, is serving as a delegate for the last time.

The Speaker called on each of the delegates named to stand, and the members of the House expressed appreciation of their services.

Messages of Condolence

Dr. Warren W. Furey, Illinois, by motion, asked that the House of Delegates take recognition of the fact that Dr. Vincent W. Archer, Virginia, was unavoidably absent from this session because of ill health, and express wishes for his speedy recovery. Dr. Furey's motion was adopted unanimously.

Dr. Laurence S. Nelson Sr., Kansas, moved that a message be sent to the widow of Dr. John Porter, a delegate from Kansas for a considerable number of years, who died early in September. This motion also was unanimously adopted.

Report of Reference Committee on Rules and Order of Business

Dr. B. O. Edwards, Chairman, North Carolina, presented the following report, which was adopted:

Mr. Speaker and Members of the House of Delegates: On behalf of the Reference Committee on Rules and Order of Business, I am pleased to offer the following resolution:

Resolved, That this House of Delegates hereby expresses its profound appreciation for all that has been done to make the meeting we are about to conclude so very pleasant and successful.

To this end, acknowledgement is made of our gratitude to Dr. Frank P. Foster, General Chairman of the Local Committee on Arrangements, his Co-Chairman, Dr. Laurence B. Ellis, and the members of their committee, as well as the representatives of the other New England states who worked with them; to the Secretary, Dr. George F. Lull, and his capable staff for the efficiency and dispatch with which they performed their tasks; to the Massachusetts Auxiliary for its efforts in entertaining our ladies and ourselves; to the Aces and Deuces for their gracious invitation to luncheon on Tuesday; to the six New England state medical societies for their long-to-be-remembered Down-East hospitality at cocktails and dinner yesterday; to the management and staff of the Statler Hotel; to our Speaker and Vice Speaker for their smooth and impartial manner in discharging a complex and difficult assignment; and to all those less obvious but nevertheless extremely important groups and individuals whose anonymous contributions are so vital in providing the myriad details which go to make up an undertaking of this magnitude.

Statement of Dr. Bruce Underwood

Dr. Bruce Underwood, Kentucky, was granted the floor on the point of personal privilege, and addressed the House as follows:

Mr. Speaker and Members of the House of Delegates: I asked for this point of personal privilege because this is my last session in the House of Delegates. I hope that I can continue to attend the meetings, but this is my last time as a delegate. I have a feeling of deep regret for what, to me, is a deep personal loss, for I have come to appreciate and to love the members of this House and the officers and trustees, who are also members, and those who work with the House.

During this session, for some reason or other, I have thought a good deal about my own father, who was a Doctor of Medicine. His death was not entirely unexpected, but the friend who broke the news to me told me that he had been through the same experience where his father's death was not entirely unexpected, and he told me that in spite of that it was still hard to take. I have heard others stand up here and speak to this House and say goodbye and thank you, and I believe I have a better understanding now of what they went through.

I have appreciated the privilege of serving in this House and the many kindnesses you have shown to me individually. I consider serving in this House of Delegates the second highest privilege I have ever had in my life. For at least a portion of the time that I served in this House, I was the youngest delegate in the House, and, as a relatively young man, to have older men as leaders and officers of this Association be so friendly and so kind was something that I cherished. However, I feel like I am getting older. I am now a past head of some organizations, the past chairman of the Aces and Deuces, and pretty soon I shall be a past delegate of the American Medical Association. Just before I came to this meeting, someone told me a definition of an old man. He said it is somebody that is fifteen years older than you are. Some of you think that I am not even dry behind the ears yet. My own boy, twelve years old, thinks I am an old fogey belonging to what he calls the 18th Century, not the 19th Century, and he has told me so in no uncertain terms. The fact of the matter is, he had a little fever recently, and I prescribed half of a 5-grain aspirin tablet for him. He spoke to his mother with some doubt as to whether he would take it, because he thought I practiced medicine like they did in the old days. I suppose that makes me middle-aged. There are many things that I would like to say to you. This isn't the time nor the place. I have spoken to the Board of Trustees about some of them, and I want to mention them just briefly.

Doctors of Medicine were primarily responsible for the establishment of State Boards of Health in this country and for health departments. I am told that Dr. J. N. McCormack of Kentucky had a great deal to do with the early organization, the writing of the original Constitution and Bylaws of the American Medical Association. Five years ago when I began as a delegate, there were five or six members of this House who were engaged in the full-time practice of public health. One of the most outstanding was a man who was kind enough to adopt me as his nephew, and I have been calling him "Uncle Felix" ever since, and that is Dr. Felix A. Underwood, of Mississippi. I don't believe at the present time that there is any delegate from any state or territory who is engaged in the full-time practice of public health. I believe that is a fact that ought to be mentioned.

In closing, I would like one additional personal word, and I assure you it takes some degree of courage to say it, and I hope you accept it in the spirit in which it is offered. The highest privilege I have ever had in my life is to know the one whom I believe to be the Author of the Bible. The Bible, in both the Old and New Testaments, teaches that "All flesh is as grass, and all the glory of man as the flower of grass. The grass withereth, and the flower thereof falleth away, but the word of the Lord endureth forever." The Bible clearly implies that this life, so far as I am concerned, is like a drop of water in an ocean of eternity. If you know the Author of the Bible, I hope you will come to know Him better. If you do not know the Author of the Bible, I hope you will meet Him. In either event, between now and Christmas, I would urge that you read some portion of the book He wrote every day. If the Bible is right, and I believe it is, and if I love and appreciate you, and I do, I could do no less than hope that in the life to come you and I will be in heaven together, and so I say thank you and goodbye as a delegate.

The House adjourned *sine die* at 2:45 p. m., Thursday, Dec. 1, 1955.

COUNCIL ON MEDICAL SERVICE

A STUDY OF MATERNAL MORTALITY COMMITTEES

This is part 1 of a new series of articles by the Committee on Maternal and Child Care of the Council on Medical Service reviewing the organization and operation of maternal mortality study committees. The purpose of this specific study is to obtain information that may be utilized in the preparation of guides that in turn may be helpful in the development and operation of maternal mortality committees in other areas in the United States. The descriptive material to follow is concerned with the Minnesota Maternal Mortality Committee, a subcommittee of the Maternal Health Committee of the Minnesota State Medical Association.

MINNESOTA MATERNAL MORTALITY COMMITTEE STUDY

History.—The Maternal Welfare Committee of the state association in 1940 voted to recommend to the association that it request the Minnesota Department of Health to cooperate in a statewide study of maternal mortality. The following year the house of delegates officially approved such a study to be conducted under the direction of the committee in cooperation with the Minnesota Department of Health. The study began July 1, 1941, but due to lack of personnel during the war was discontinued June 30, 1942. It was resumed in 1950 and is now in its sixth consecutive year.

The essential purpose of the maternal mortality study is to provide the medical profession of Minnesota with information useful in protecting the life and health of mothers. The committee seeks to determine actual causes of maternal deaths, to classify them, to study them, and to draw conclusions that will point the way to continued reduction in maternal mortality. The committee members are selected by the Maternal Health Committee of the state medical association and are appointed by the council of the association. They serve without remuneration. The committee originally had 6 members but now has 12; 11 are obstetricians representing all areas of the state; the 12th member is the chief of the Section of Maternal and Child Health of the State Department of Health and serves as secretary. The members serve until they wish to retire; the permanent chairman is chosen by the council; and three obstetrician-investigators are employed to travel over the state to collect and study data on maternal deaths. These data are presented to the committee members who then decide on the various aspects of the maternal deaths.

Scope of Study.—The study includes all women who die during pregnancy or within the three month postpartum period, regardless of the actual cause of death. A maternal death is defined as any death associated with pregnancy (including abortion and extrauterine pregnancy) or the puerperium (for a period of three months postpartum), whether or not some pathology of pregnancy is the actual cause of death. An obstetric death is defined as one ascribed to pregnancy, childbirth, or the puerperium for a three month period as listed in chapter 11 of the Manual of the International List of Diseases, Injuries and Causes of Death but also includes chorioepithelioma regardless of the interval following pregnancy. In addition, obstetric deaths also include such associated causes as criminal abortion, anesthesia, improper obstetric care and treatment, certain heart diseases, and certain infections. The diseases of the heart (e. g., rheumatic heart disease as contrasted to coronary thrombosis) must be aggravated by pregnancy in order that a case be classified under the heading of obstetric death. The committee studies all maternal mortality cases occurring in the state and those in which patients were treated just outside of the state by Minnesota physicians. However, in the compilation of statistics, both the committee and the state health department include only those cases in which patients were residents of Minnesota.

Financing.—The state health department provides for the expense of the study. In 1954 the budget was $6,000. The obstetrician-investigators are paid $50 per day for not more than 100 days for all services performed within a year's time. In addition, clerical help is supplied by the Section of Maternal and Child Health, Minnesota Department of Health, with special clerical help provided also by the Minnesota State Medical Association.

Operation—Agencies and Personnel Involved.—The state medical society and the state department of health jointly conduct the study program with the cooperation of the state university hospital and the state hospital association. Maternal death certificates are received by the Section of Vital Statistics of the Minnesota Department of Health and photostat copies are prepared and forwarded to the Section of Maternal and Child Health. Because this routine procedure allowed considerable delay between the death of the patient and the investigation by the committee, the state department of health enacted the following regulation: "Any death associated with pregnancy (including abortion and extrauterine pregnancy), or the puerperium (for a period of three months postpartum), whether or not it is the actual cause of death, shall be reported by mail within 3 days after death to the Minnesota Department of Health, Section of Maternal and Child Health, by the attending physician and by the hospital where the death occurred." This insures prompt investigation before important details of the case may have been forgotten. In addition, since deaths occurring during the postpartum period frequently do not mention pregnancy on the death certificate, a cross matching of all female deaths of persons aged 15 through 45 with all births in the preceding three months will show additional deaths associated with pregnancy or the puerperium. Other cases are occasionally discovered through the newspapers and reports from nurses and other hospital personnel.

As soon as possible after a maternal death is reported, one of the obstetrician-investigators visits the attending

---

Committee members are W. L. Crawford, M.D., chairman, Rockford, Ill.; R. B. Chrisman Jr., M.D., Coral Gables, Fla.; Philip S. Barba, M.D., Philadelphia; Harold S. Morgan, M.D., Lincoln, Neb.; J. L. Reichert, M.D., Chicago; Garland D. Murphy, M.D., El Dorado, Ark.; Howard A. Nelson, M.D., Greenwood, Miss.; and Donald A. Dukelow, M.D., consultant, Chicago.

physician, obtains the history, and discusses various aspects of the death. He visits the hospital, reviews the records, and talks with hospital personnel who came in contact with the patient. The consultant, if one had been called in, is also interviewed. If necessary the investigator may even get additional information from the relatives through the attending physician. All the data gathered are directed toward completion of the mortality study questionnaire. The obstetrician-investigator strives to be entirely objective and impersonal in his questioning and makes no comment or criticism of the handling of the case since that is the function of the committee. When he thinks it advisable, he obtains x-rays and pathological material for review by the committee. His next step is to formally put together and summarize the data after critically considering them for accuracy, completeness, and comparison of the cause of death as noted on the death certificate. In preparing his summary, the investigator may consult with nonobstetric specialists concerning the importance of complications on the course of the case. His case summary may be discussed with the chief of the department of obstetrics and gynecology of the University Hospital before it is submitted to the committee.

Data are kept confidential by means of a questionnaire with a detachable identifying sheet. This sheet contains information identifying and describing the mother, physician, consultants, pathologists, involved hospital personnel, and the infant. The detached sheet and minutes of committee meetings that contain records of committee discussions and decisions are preserved and filed by the chief of the Section of Maternal and Child Health, Minnesota Department of Health, at the request of the committee members. The original questionnaire (anonymous) is used by the department of obstetrics and gynecology of the University Hospital for teaching purposes.

The investigator presents the case summary, identifiable only by case number and the year, at the regular meeting of the committee. These committee meetings are called about every three months and usually last all day. They are closed to all except committee members, although exceptions have been made for occasional visiting obstetricians. The committee as a whole makes all final decisions. The cause of death is determined. The management of the case is critically evaluated as to adequacy of medical care during the three phases: (1) prenatal, (2) labor and delivery, and (3) puerperium. The committee makes final assessment as to the preventability of the death and the responsibility for the death; it passes on the adequacy of the autopsy and the completeness and accuracy of the death and birth certificates. After full deliberation, the committee may charge responsibility for the death to the physician, hospital, patient, disease, or any combination of these factors. Since cases are presented anonymously, free discussion and unbiased conclusions are possible.

Follow-Up and Disposition of Cases.—Copies of the case summary, including criticism of the handling of the case and the conclusions of the committee, are mailed to the responsible physician and to any involved consultant. Accompanying this material is a letter from the chairman that states his authority from the state medical society for sending the summary, notes the anonymous methods by which cases are reviewed, and invites constructive comment in furthering the work of the committee.

At the end of each 12 month period, the investigators and members of the department of obstetrics and gynecology of the University Hospital prepare a report on the year's study together with their conclusions. This report is reviewed individually by members of the study committee and is modified or approved by them as a committee before it is published as their report in the official journal of the state medical society. Reprints of the report are mailed to all members of the state society by the state department of health. From time to time editorials concerning the study are prepared and published. Papers on various phases of the study have been prepared by investigators and individual members of the committee and have been published. The obstetrician-investigators have correlated data from the study by preparing lantern slides and use these in talks to local medical societies and to hospital groups. On two occasions, the committee as a whole has appeared on local medical society programs presenting a typical case review with discussion and vote as to the final disposition of the case. The yearly reports of the study are consulted in selecting obstetric subjects for presentation at the annual sessions of the state medical association in the form of round tables, symposiums, and formal addresses. In these and other ways, members of the state medical association have been familiarized with the methods and findings of the study committee.

TABLE 1.—*Causes of Obstetric Deaths and Percentage Distribution of Deaths Considered Preventable in 1950, 1951, and 1952* *

Cause	Cases		Preventable Deaths	
	No.	%	No.	%

* Minnesota Maternal Mortality Study by the Maternal Mortality Committee of the Committee on Maternal Health, Minnesota State Medical Association, table 16, Minnesota Med. 38: 14 (Jan.) 1955.

Results—Statistical Analysis.—The Minnesota maternal mortality rate was 1.68 per 1,000 live births in 1941 when the study was first conducted, whereas the United States rate was 3.2. In 1950, when the maternal study was again resumed, the rate was 0.59 per 1,000 live births and declined to 0.42 per 1,000 live births in 1952; the United States rate was 0.83 in 1950 and 0.68 in 1952. In 1953 the rate was 0.40 and provisional statistics on "obstetric" deaths for 1954 indicate a rate of 0.4 per 1,000 live births with 80,620 live births recorded (99.8% delivered by physician and 99.1% in hospitals). Table 1 shows causes of obstetric deaths and percentage distribution of total deaths considered preventable for the three year period, 1950 through 1952. An analysis of the cause of obstetric deaths shows that hemorrhage accounted for 28% of the total and almost one-half of the obstetric deaths that were considered preventable.

Hemorrhage accounted for more than three times as many preventable deaths as the next leading cause, toxemia. Some of the factors involved in the deaths due to hemorrhage include accouchement forcé, improper use of pituitary extracts during labor, and inadequate and delayed replacement of blood.

In recent years there has been a decreasing ratio of obstetric deaths in Minnesota (table 2) to deaths associated with pregnancy, but not directly due to pregnancy. Table 2 gives the actual number and percentage of obstetric and nonobstetric deaths for the years that data are available. The final maternal mortality rate is calculated on those maternal deaths classified as due to obstetric causes.

Analysis of table 3 shows a remarkable reduction in the proportion of preventable deaths since 1941. Only 25.4% of the maternal deaths studied were classified as preventable in 1953 in contrast to 73.2% in 1941, even though there were 30% more deliveries in 1953. Table 4 shows that the 15 preventable maternal deaths are from the 32 deaths classified as due to obstetric causes. Table 4 also lists the primary causes of these obstetric deaths indicating the assignment of responsibility if they were considered preventable. It is indeed significant that in 1953 hemorrhage was the cause of only 4 maternal deaths in Minnesota in contrast to 33 deaths from this cause during the previous three years.

TABLE 2.—*Maternal Deaths Classified as Obstetric and Nonobstetric in 1941 and 1950-1953*

	1941		1950		1951		1952		1953	
	No.	%	No.	%	No.	%	No.	%	No.	%
Obstetric deaths	93	83	46	67.6	39	68.4	33	56.9	32	55.3
Nonobstetric deaths	19	17	22	32.4	18	31.6	25 *	43.1	27 †	45.7

* Bulbar poliomyelitis, 11; trauma, 4; intracranial hemorrhage, 3; brain tumor, 2; leukemia, 1; suicide, 1; obstruction trachea, 1; acute glomerulonephritis, 1; thrombocytopenic purpura, 1.

† Bulbar poliomyelitis, 6; intracranial hemorrhage, 4; neoplasms, 4; peritonitis, 4; trauma, 4; unknown, 3; meningitis, 1; lupus erythematosus, 1.

TABLE 3.—*Preventability of Maternal Deaths in Minnesota in 1941 and 1950-1953*

	1941		1950		1951		1952		1953	
	No.	%	No.	%	No.	%	No.	%	No.	%
Preventable	82	73.2	22	32.4	24	42.1	10	17.2	15	25.4
Nonpreventable	27	24.1	45	66.1	32	56.1	47	81.0	44	74.6
Not determinable	3	2.7	1	1.5	1	1.8	1	1.7	0	....

Conclusion.—In Minnesota, the maternal mortality rates have shown a continuous and significant decrease during the past years. This continued reduction is due not to any one factor but includes better undergraduate training of physicians, increasing postgraduate and refresher courses in obstetrics, increasing percentage of babies born in modern hospitals, widespread use of chemotherapeutic agents, and early and adequate blood replacement. In addition, the maternal mortality study program for the education of physicians and hospital personnel, as well as public health measures, such as education of the public in the importance of early and adequate prenatal and obstetric care, are other important factors in the reduction of maternal mortality. During the course of the committee's studies, there was demonstrated the need for the improvement of inservice training, particularly in laboratory, x-ray, medical records, and anesthesia services. As a result, refresher training courses have been held at various key locations throughout the state; extension courses for laboratory aides and x-ray technicians are being conducted at the University of Minnesota, and there is an intensified recruitment program by all disciplines concerned. These activities should ultimately improve services available to the patient.

The following minimum requirements for adequate obstetric care have been adopted by the Minnesota Maternal Mortality Committee and published with the 1950 report in *Minnesota Medicine.*[1]

First prenatal visit

1. Adequate history and general physical examination with accurate follow-up of any abnormality revealed by these.
2. Pelvic mensuration to include intertuberous diameter, diagonal conjugate and palpation of sacrum and spines.
3. Laboratory workup—blood, serology for syphilis, hemoglobin, urinalysis and Rh determination.

Routine prenatal visits

1. Blood pressure determination.
2. Urinalysis, especially for albumin.
3. Weight determination.
4. Abdominal palpation during last two months of gestation.
5. Reasonably adequate study of abnormalities presenting themselves during these visits.

Labor and delivery

1. Adequate use of generally recognized obstetric procedures.
2. Observance of adequate asepsis.

Postpartum Care

1. Reasonable promptness in the recognition of abnormalities.
2. Reasonable promptness in the institution of adequate treatment.

Postmortem examination

1. Completeness in itself or as an adjunct to clinical observation.

Death certificate

1. Accuracy in assignment of cause of death.
2. Completeness of data requested.

Birth or Stillbirth certificate

1. Completeness in reporting desired data.
2. Accuracy of data.

---

[1] Minnesota Maternal Mortality Study by the Maternal Mortality Committee of the Committee on Maternal Health of the Minnesota State Medical Association, Minnesota Med. 36:609 (June) 1953.

Death certificate of child

1. Accuracy in assignment of cause of death.
2. Completeness of requested data.

Through their publications the committee constantly stresses the importance of autopsies. Since many autopsies have not been done in the past because a pathologist was not available, the committee has arranged with the state department of health that a pathologist be employed when necessary. A physician in any part of the state need only notify the state health department that approval for an autopsy has been granted. A pathologist will be procured to do the job.

The efforts of the committee's study have stimulated the establishment of a maternal mortality committee and a neonatal mortality committee in Virginia and in an area in the western part of the state. Duluth has recently established a maternal mortality committee. The Hennepin County Neonatal Mortality Study Committee of the Hennepin County Medical Society was established in 1952.

Table 4.—*Primary Causes of Maternal Deaths Classified as Obstetric in 1953, Showing Preventability and Assignment of Responsibility*

			Preventable		
Cause	Total	Non-preventable	Physician	Patient	Other
Toxemia	8	4	3	1	..
Hemorrhage	4	..	4	..	..
Infection	3	1	1	..	1 (abortionist)
Anesthesia	1	1	..	..	..
Transfusion accidents	4	1	..	..	3 (2—laboratory 1—hospital)
Heart disease	4	4	..	..	..
Suicide	2	2	..	..	..
Pulmonary embolism	2	2	..	..	..
Amniotic fluid embolism	1	1	..	..	..
Pituitrin shock	1	..	1	..	..
Acute pulmonary edema	1	1	..	..	..
Diabetic acidosis	1	..	1	..	..
Total	32	17	10	1	4

It is anticipated that similar study committees will be formed in other large communities of Minnesota and that eventually the whole state will participate in perinatal mortality studies as well as maternal. Relatively few adverse situations have arisen in connection with the committee studies. After careful explanation of the purpose of the committee, the physicians concerned have generally been quite willing to cooperate in subsequent committee investigations.

Since its inception the work of the maternal mortality committee has been in the nature of professional self-criticism of a constructive type with benevolent and life-saving objectives. But it was apparent that if some information or records of the committee were to be made public, it was conceivable that a physician could be subjected to embarrassment or even to a malpractice suit based on his handling of a case. Hence it is desirable and essential to the success of the maternal mortality study program that physicians be allowed to cooperate voluntarily and completely without fear or threat of legal action based on admissions and revelations of the doctor in his willingness to aid research and further technical knowledge in this field. The 1954 Minnesota rate of 0.4 maternal deaths per 1,000 live births was very low, one of the lowest in the United States. It was felt that the rate could be reduced even more if maternal mortality studies could be continued on an open, yet protected, plane. A similar situation had occurred in regard to confidential information to be received from physicians for a cancer research study. The need for such confidential information was deemed so serious that in 1949 the legislature enacted a bill that authorized the state board of health to establish a cancer statistical research service and declared that such cancer reports as those filed with the state board of health were to be confidential, and unauthorized disclosure of any information in such records was made a misdemeanor. Therefore, in view of this precedent, an act, which pertained to research studies conducted by the state department of health and other agencies and which provided for the confidential character of such research studies, was presented to the 1955 session of the state legislature and enacted into law. This bill provides that such research studies as the state department of health may undertake are in a preferred status in regard to the treatment of its records. The bill provides that such information "shall not be admissible as evidence in any action of any kind in any court or before any tribunal, board, agency or person." Also, it provides that information on the nature and course of the studies and the results obtained therefrom may be published, but names or identifying data cannot. It in no way closes off from view information or sources thereof—it merely provides that data procured by the state department of health in connection with these studies cannot be used as a source of evidentiary facts. This bill was made general and broad so that it would be unnecessary for the state board of health to go to the legislature with new problems that might arise from studies instituted in ensuing years.

Maternal mortality studies have had a desirable psychological effect on physicians and hospital personnel as well as on the public. Physicians have become more careful, more conservative in their treatment, and request consultation earlier. Individual physicians have had honest errors pointed up, and there is every reason to believe that these will not be repeated by the person concerned. The results of these studies are used for the education and guidance of physicians at hospital staff meetings, at county medical society meetings, and at refresher courses; for undergraduate teaching at the medical school; and for publication in medical journals. The studies have supplied information that has changed the emphasis of both undergraduate and postgraduate teaching. As a result of these studies even further reduction in maternal mortality is expected.

Jaundice in Cardiac Patients.—Jaundice in cardiac patients does not occur without infarction. It can occur secondarily to cardiac cirrhosis or necrosis of the hepatic cells. Since jaundice can be overlooked in a cyanotic patient, it is important to determine the serum bilirubin in any suspect case. Another difficulty . . . is that jaundice does not appear in the skin over areas where edema is present. Once jaundice is recognized in a cardiac patient, it is extremely important to have good proof of an embolus before instituting anticoagulant therapy.—J. G. Parker, M.D., and L. Felder, M.D., Jaundice in Cardiac Failure Without Infarction, *Annals of Internal Medicine*, November, 1955.

PUBLIC RELATIONS

Doctors Honor Local Newsmen

Too often in this world the good things are taken for granted while the things we do not like get a disproportionate share of attention. This is sometimes the case where medical newswriters are concerned. To reverse this situation, many medical societies honor newsmen for excellence in medical reporting and writing.

Most recent example of this practice comes from Phoenix, Ariz. At the third annual awards dinner of the Maricopa County Medical Society, a popular Phoenix science writer, Julian DeVries, was presented an honorary associate membership in the society and a gold-plated stethoscope. DeVries, who writes for the Phoenix *Gazette* and the Arizona *Republic*, received the awards for "his effective contribution to better understanding of the medical profession through his newspaper column, news articles, and his television program, 'M.D.'s Notebook.'" This is the second award given DeVries by the society. His first, "for distinguished public service," was presented in 1953. Two other newspapermen, one from the Phoenix *Gazette* and the other from the Arizona *Republic*, also were given awards for specific stories they had written on health problems. It was the doctors' way of saying, "Thank you for a job well done."

Good press relations must be an integral part of every medical society public relations effort. Good press relations can only result when both physicians and newsmen reach a mutual understanding about their respective responsibilities where medical news is concerned. Medical societies have taken a long step in the right direction in recent years by holding medical-press dinners at which doctors and newsmen can get acquainted and talk over problems. Out of such cooperative meetings have come many formal and informal press codes of cooperation to guide both medical men and writers in handling medical stories. Awards to the men at the local level, like those given in Phoenix recently, are just one more way to build medical-press cooperation, for they are concrete indications that physicians appreciate the day-to-day services of the men who actually cover the local medical beat.

Can Your Assistant Keep a Secret?

Physicians, well indoctrinated with the Principles of Medical Ethics, know there can be no compromise with medical confidences. Any confidential information received by the doctor from a patient must remain inviolate. His office assistant may not, however, be as aware of the importance of respecting medical confidences. The doctor himself must familiarize her with those aspects of medical ethics that apply in her daily work. Careless breaches of medical ethics in this area create not only public relations problems but legal ones as well.

The physician can emphasize the importance of keeping secret information that pertains to patients by calling his assistant's attention to the section in the Principles of Ethics that says: "Patience and delicacy should characterize the physician. Confidences concerning individual domestic life entrusted by patients to a physician and defects in the disposition or character of patients observed during medical attendance should never be revealed unless . . . required by the laws of the state."

Public relations and legal aspects intermingle when a curious patient, for example, asks the doctor or assistant personal questions about other patients. Without giving offense, those in the office must firmly refuse to provide such information. A tactful, courteous refusal will discourage further questioning. Confidential papers, case histories, and even the appointment book should be kept out of reach of curious eyes—to protect the patient as well as the doctor and his aides. The doctor-patient relationship is of such stature that every action of the physician and his aides should be devoted to enhancing it. This is the actual aim of nearly every medical public relations effort.

PRoblem Corner

"Medical care costs too much." Every physician hears this complaint, directly or indirectly, from his patients, his neighbors, or others in his community from time to time. What can he as an individual physician do to combat such criticism? Misunderstanding between the doctor and his patient in regard to medical expenses creates a real public relations problem. One study recently showed that, though many persons felt the cost of medical care was high in relation to the services received, none had a crystallized idea of what they should be getting. Naturally, people are reluctant to pay for medical and hospital care. They did not ask to be sick. They are forced into paying for an unwanted service. Furthermore, once a patient is well, his gratitude for medical services wanes rapidly. As long as human nature continues to operate in the traditional fashion, patients probably will continue to say about doctors: "After all, all he did was make me well!"

A better understanding of medical and hospital services and their cost is obviously necessary. The plaque that the A. M. A. sells to physicians to encourage advance fee discussions is one technique for achieving this understanding. The newest A. M. A. leaflet, "To All My Patients," which is being provided in quantity to A. M. A. members, is designed to help physicians explain various aspects of medical care and its costs. The individual physician himself must share in the responsibility of organized medicine for pointing out to individuals that, actually, medical costs have not risen as fast or as high as other consumer costs. In reality, the patient gets more for his medical care dollar today than ever before because of improved medical techniques, new medicines, and treatments that cut illness time considerably.

But how many patients know that the physician's share of the medical care dollar is constantly dwindling? In 1929 he received 33 cents of each medical dollar; today he gets only 28 cents. The dentists' share, too, has shrunk from 16 cents to 10 cents. The hospital's share of the medical care dollar, however, has jumped from 14 cents in 1929 to 26 cents in 1954. Other medical expenses that took 17 cents in 1929 take about 20 cents today. It is up to the individual physician not only to help tell this story but also to encourage his patients to consider medical expenditures as investments in good health and a longer, more productive life.

MEDICAL NEWS

ALABAMA

Reopen Physical Therapy Unit.—The physical therapy unit of the University of Alabama Medical Center is scheduled to reopen about Jan. 1, 1956. The facility, located in University Hospital, has been closed since 1951. Among the agencies cooperating with University Hospital to reactivate the unit are the local chapter of the Alabama Society of Crippled Children and Adults, the Multiple Sclerosis Society, the State Vocational Rehabilitation Service, the Muscular Dystrophy Association, United Mine Workers Welfare and Retirement Fund, the Institute for the Handicapped, and the National Foundation for Infantile Paralysis.

University News.—The Medical College of Alabama, Birmingham, announces that Dr. James Garland Wood, assistant professor and acting chairman of the department of radiology, has been promoted to associate professor. Dr. Louis S. Graham has been appointed associate professor of pathology; Dr. William Nicholson Jones, professor and acting chairman, department of obstetrics and gynecology; Dr. Frank S. Moody, chairman, department of otolaryngology (voluntary basis); Dr. Josiah C. Carmichael, associate professor and chief, obstetrics section, obstetrics and gynecology; Dr. Waldo Philip Hitchcock, associate professor of anesthesiology; Dr. E. Edward Evans, associate professor of microbiology; Drs. Irwin Schoen, Robert E. Roth, and Harold Schneider, assistant professors of pathology; Dr. Jolyon S. Tucker, assistant professor of clinical neurology, psychiatry, and neurology; Dr. Thomas Joseph Reeves, associate professor of medicine; and Dr. James N. Sussex, associate professor of psychiatry.——Dr. Melson Barfield-Carter, professor and chairman of the department of radiology since 1945, retired Aug. 1, as did Dr. James R. Garber, professor of obstetrics and chairman of the department of obstetrics since 1945.

CALIFORNIA

Hospital News.—The second term (academic year 1955-1956) of the training course for personnel concerned with the care of cerebral palsied children will begin at Children's Hospital in San Francisco Feb. 1. This will be the second year of this training program supported by the United Cerebral Palsy Association in this hospital. For information, write to: Dr. Luigi Luzzatti, Children's Hospital, 3700 California St., San Francisco.

Psychiatric Case Seminar.—Open to qualified practicing psychiatrists, an advanced psychiatric case seminar will meet on Wednesdays, 8-10 p. m., Feb. 1-March 21, 1956, in room 108, Old Religious Conference Building at the University of California at Los Angeles. Requests for information should be made to Dr. Thomas H. Sternberg, Assistant Dean for Postgraduate Medical Education, University of California Medical Center, Los Angeles 24. The fee for the course, which is limited to 20 students, is $60.

Course in Pathological Physiology.—The University of California Extension, Los Angeles, will open to graduates of approved medical schools a course in pathological physiology (fee, $50), which will meet Mondays, 7:30-9:30 p. m., beginning Jan. 30, 1956, in room 12-096 of the university's medical center. The course is designed to aid practicing physicians in understanding and applying to their clinical problems certain relatively recent physiological concepts concerning the pathogenesis of disease. The effects of therapeutic procedures, particularly as they cast light on the physiological processes under discussion, will also be considered, according to Dr. Victor E. Hall, chairman. Requests for information should be made to Dr. Thomas H. Sternberg, Assistant Dean for Postgraduate Medical Education, University of California Medical Center, Los Angeles 24.

CONNECTICUT

University News.—Dr. Aaron B. Lerner, since 1952 associate professor of dermatology at the University of Oregon Medical School, Portland, has been appointed to the same position at the Yale University School of Medicine, New Haven, where he will also serve as head of the section of dermatology. Dr. Lerner was assistant professor of dermatology at the University of Michigan Medical School, Ann Arbor, from 1949 to 1952.——Dr. Harold M. Frost Jr., Buffalo, has been named assistant professor of orthopedic surgery at the Yale University School of Medicine.

Lectures on Medical Economics.—Dr. Creighton Barker will serve as moderator for the session on state license and specialty boards, presented by the Connecticut State Medical Society and the department of public health, Yale University School of Medicine in Brady Auditorium (310 Cedar St., New Haven) on Jan. 5, 4 p. m. "The State License" will be discussed by Dr. Louis P. Hastings, Hartford, member, Connecticut Medical Examining Board; "National Board of Medical Examiners," by Dr. John P. Hubbard, Philadelphia, executive secretary, National Board of Medical Examiners; and "Specialty Boards" by Dr. Courtney C. Bishop, Yale University School of Medicine, New Haven.

DELAWARE

State Medical Election.—Newly elected officers of the Medical Society of the State of Delaware include: Dr. Glenn W. M. Van Valkenburgh, Georgetown, president; Dr. Roger Murray, Wilmington, president-elect; Dr. John B. Baker, Milford, vice-president; Dr. Norman L. Cannon, Wilmington, secretary; and Dr. Charles Levy, Wilmington, treasurer.

DISTRICT OF COLUMBIA

Physicians Honored by Cuba.—On Dec. 3 President Fulgencio Batista of Cuba bestowed the Order of Merit of Carlos Finlay on Dr. Francis M. Forster, dean, Georgetown University School of Medicine and professor of neurology, and Dr. Felipe A. Martinez, associate professor of anatomy. Dr. Forster has lectured at a number of hospitals in Cuba and served last summer as a visiting professor of neurology at the University of Havana Faculty of Medicine and Pharmacy. Dr. Martinez, a native of Cuba and an alumnus of the Georgetown medical school in Washington, D. C., was cited for his 10 years' work in anatomy at the university and for his devotion to Pan-American medicine.

Personal.—Dr. W. Montague Cobb, head, department of anatomy, Howard University College of Medicine, Washington, D. C., has been awarded the honorary degree of doctor of science by his alma mater, Amherst (Mass.) College. He was cited as a "teacher, scholar, scientist, and physician." Dr. Cobb has contributed to medical literature on such subjects as the effects of aging on the human skeleton, graphic techniques of teaching anatomy, and the physical anthropology of the American Negro.——Dr. Fred L. Soper, Washington, D. C., director, Pan American Sanitary Bureau, Regional Office of the World Health Organization, was awarded an honorary degree by Jefferson Medical College of Philadelphia on Sept. 23. The citation noted that "as director of the Pan American Sanitary Bureau, Dr. Soper has used his enormous administrative talents toward coordinated effort in the Americas in the field of public health."

FLORIDA

Hospital News.—The dean's committee of the Veterans Administration Hospital of Coral Gables has been reconstituted to consist of Homer F. March, Ph.D., dean of the University of Miami School of Medicine, Coral Gables, as chairman, and Drs. John J. Farrell, Ralph Jones, and William A. D. Anderson,

---

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education, and public health. Programs should be received at least three weeks before the date of meeting.

chairmen of the school's departments of surgery, medicine, and pathology, respectively, as members. Dr. Edward F. Zimmerman, chief, professional services of the hospital, was designated as the manager's representative to the committee.

Cardiac Work Classification Unit.—The Heart Association of Greater Miami announces the opening of a cardiac work classification unit at Jackson Memorial Hospital, Miami, as part of the community service program of the association. The purpose of the unit is to evaluate the ability of the individual with heart disease to work at gainful employment. Patients referred to the unit will receive a complete examination to establish the cardiac diagnosis and degree of work ability. The problems of each patient are considered in conference by the entire group, and specific recommendations are made to the referring physician. The unit does not function as a diagnostic clinic nor does it prescribe treatment. Patients may be referred to the unit only by physicians. There is no charge for the service. Information may be obtained by calling the Heart Association of Greater Miami, telephone 2-3337.

GEORGIA

Personal.—Dr. Jesse C. Dover, Clayton, who has served in Rabun County for over 50 years, was honored Aug. 26 with a "Dr. Dover Birthday Party." About 300 people attended the party, which celebrated his 80th birthday. The program included a skit in which various events in the doctor's life were acted out. Dr. and Mrs. Dover were presented with a silver tea service.

Name Chief of Ophthalmology.—Dr. John R. Fair has been appointed assistant professor of surgery and chief of ophthalmology at the Medical College of Georgia, Augusta. Dr. Fair, who was formerly assistant director of the Ocular Research Unit, Walter Reed Army Medical Center, Washington, D. C., in 1954 served as chief of the eye section of the Army's 98th General Hospital in Germany, a post from which he resigned with the rank of Lieutenant Colonel.

ILLINOIS

Psychiatric Lecture.—Dr. Franklin G. Ebaugh, clinical professor of psychiatry, University of Colorado School of Medicine, Denver, will present "The Management of the Depressed Patient" Jan. 4, 1956, 8 p. m., at the North Shore Health Resort, 225 Sheridan Rd., Winnetka. All physicians are cordially invited.

Chicago

Multiple Sclerosis Clinic.—The Chicago chapter, National Multiple Sclerosis Society (53 W. Jackson Blvd.), announces the recent opening of a clinic for multiple sclerosis patients at St. Luke's Hospital, under the direction of Dr. Roland P. Mackay, assisted by Dr. Donald D. Layton, resident neurologist at St. Luke's. Sessions are conducted on Tuesday mornings and on Friday afternoons. Applicants should request referral or sanction from their physician before applying for admission. Any member of the Chicago chapter of the National Multiple Sclerosis Society or patients residing within the metropolitan area of Chicago may apply for admission. For a clinic appointment call the Morton Clinic, HA 7-5000, and ask for Miss Dana or Miss Gilham.

Founders' Day Awards.—Awards for high scholastic averages and meritorious research were presented during the 98th founders' day ceremonies at Northwestern University Medical School to the following: Dr. Arthur L. Norins, Park Ridge, Ill., winner of the Borden undergraduate research award in medicine ($500 and a certificate), given to a student in the graduating class who performed meritorious medical research while an undergraduate medical student; Edwin L. Cohen, Toledo, Ohio, winner of the James P. Simonds award ($50 and a certificate), established this year by Phi Chi fraternity in honor of Dr. James P. Simonds, emeritus professor and chairman of the department of pathology at the medical school, for clinical achievement and promise as shown in the first study of clinical medicine in hospitals during the junior year; and Donald M. Hopkins, Walnut, Ill., winner of the George J. Dennis Phi Rho Sigma award ($100 and a certificate) for the highest scholastic average in studies during the first three years of medical school. A certificate of recognition was given to Phi Delta Epsilon as the medical fraternity maintaining the highest scholastic average for the year, and Dr. Melvin P. Firestone, of Jersey City, N. J., received a $50 bond as the student in the fraternity who contributed most toward winning the award. Edward H. Cornell, Park Ridge, Ill., was winner of the $50 Leslie B. Arey award, established by Phi Beta Pi in honor of Leslie B. Arey, Ph.D., professor and chairman of the department of anatomy, and given to the freshman student with the highest grade in anatomy studies.

MICHIGAN

State Medical Society Election.—Newly elected officers of the Michigan State Medical Society include: Dr. William S. Jones, Menominee, president; Dr. Arch Walls, Detroit, president-elect. Dr. L. Fernald Foster, Bay City, is secretary, and Dr. William A. Hyland, Grand Rapids, is treasurer of the society.

Fertility Center.—A new fertility center has been established at the Woman's Hospital, Detroit, under the joint sponsorship of the hospital and Wayne University College of Medicine. Dr. Robert B. Leach, assistant professor of medicine at the college, is medical director. Couples will be accepted in the center only when referred by practicing physicians.

Otolaryngology Conference.—The department of postgraduate medicine at the University of Michigan Medical School, Ann Arbor, will hold an otolaryngology conference at the University Hospital, April 19-21, 1956, under the direction of Dr. Albert C. Furstenberg, chairman, department of otolaryngology. Guest lecturers, together with members of the staff of the department of otolaryngology, will participate in the program. For information, write to Dr. John M. Sheldon, Director, Department of Postgraduate Medicine, University Hospital, Ann Arbor.

MINNESOTA

Dr. Barr Succeeds the Late Dr. Chesley.—Dr. Robert N. Barr, Minneapolis, who worked closely with the late Dr. Albert J. Chesley for 21 years, has been appointed secretary and executive officer of the Minnesota Department of Health. Dr. Barr, Minnesota's fifth health officer since the state board of health was founded in 1872, is a consultant to the national advisory committee on heart disease control and a member of the national advisory committee on functional study of public health nursing, both committees of the U. S. Public Health Service, and serves the subcommittee on chronic disease, Association of State and Territorial Health Officers, and the committee on aging of the American Public Welfare Association.

Clergymen's Workshop on Psychiatric Problems.—For the third year, the Hamm Foundation of St. Paul has made a grant to the St. John's Institute for Mental Health at Collegeville, which assures the continuation of the institute's program of summer workshops for clergymen of all faiths who wish to study psychological and psychiatric problems. The summer clinics, which have pioneered in bringing together clergymen of all faiths for the study of mental health problems, were attended last year by 123 priests and ministers, who came from 17 states, 2 Canadian provinces, the Bahama Islands, Puerto Rico, and France. The faculty included four presidents of the American Psychiatric Association or the American Orthopsychiatric Association. Chairman of the board of the institute is Dr. Hyman S. Lippman, director of the Amherst H. Wilder Child Guidance Clinic of St. Paul.

NEBRASKA

Crippled Children's Clinics.—Clinics for crippled children have been scheduled at the Norfolk State Hospital in Norfolk, Jan. 7, 1956, and St. Mary Hospital, Scottsbluff, Jan. 21.

University News.—Three stones, inscribed "Omaha Medical College," a gift of Dr. Frank L. Dunn, constitute the first building materials for the new hospital unit of the University of Nebraska College of Medicine in Omaha. The stones, salvaged from the Omaha Medical College, which was incorporated into the University of Nebraska medical education program in 1901, were found recently in the basement of a wrecking company which tore down the building in the early 1930's. According to Dr. James P. Tollman, dean of the college of medicine, the stones will be set into an inner wall of the new hospital building to commemorate the beginning of formal medical education.

Personal.—Dr. Clarence Minnick and Dr. Benjamin F. Stewart, Cambridge, were jointly honored by the Cambridge Chamber of Commerce at a dinner, at which Dr. Earl F. Leininger, McCook, gave an address. Dr. Minnick has practiced medicine for 50 years and Dr. Stewart for 55.——Dr. William L. Howell, who has served the Hyannis area for 41 years, was recently honored at a dinner given by 500 residents of the area, who presented him with a 1956 Oldsmobile. Dr. Howell, who was in the Army Medical Corps during World War I, has been a member of the school board of Hyannis for 21 years and its chairman during the last 19 years. He also served eight years on the town council.

NEW YORK

County Society Honors Father and Son.—At its annual meeting, the Madison County Medical Society presented to Dr. John D. George Sr., Verona, the Doctor Milton R. Joy Memorial award for service to the people and medical profession in Madison County, and elected Dr. John D. George Jr., Verona, vice-president. The senior Dr. George, father of four physician sons, has practiced for over 50 years.

Tuberculosis Campaign.—According to a joint statement by the departments of health, hospitals, and welfare of New York City and the Brooklyn, Queensboro, and New York tuberculosis and health associations, the prevention and control of tuberculosis is one of the costliest health problems in New York City. The statement says that, "In dollars and cents, a conservative estimate of the annual cost of tuberculosis in New York City is $50,000,000." Prevention and practical control are said to be impeded by four major obstacles: (1) absence of warning signals in early tuberculosis (in 1954, of the 6,582 New Yorkers reported to have newly discovered tuberculosis, 4 out of 5 had the disease in moderately or far-advanced form when detected. In addition, about 10,000 New Yorkers have the disease without knowing it); (2) lack of adequate housing and proper nutrition for large numbers of persons; (3) length of time required for cure; (4) lack of sufficient rehabilitation and community services to facilitate the patient's return to a useful, productive life.

University News.—Dr. Richard T. Beebe, chairman, department of medicine, Albany Medical College, announces the appointment of Dr. Joseph John Russo as assistant professor of dermatology and of Dr. Leonard D. Policoff, formerly of Richmond, Va., as associate professor of physical medicine and rehabilitation, head, subdepartment of physical medicine and rehabilitation in the department of medicine, and assistant professor of medicine. Dr. Donald W. Drew has been promoted from instructor to assistant professor of medicine and Dr. Frank C. Maxon Jr. from instructor in medicine to assistant professor of medicine and head of the subdepartment of pulmonary diseases. ——Dr. Thomas N. A. Jeffcoate, professor of obstetrics and gynecology, University of Liverpool (England) began a month's visiting professorship of obstetrics and gynecology at the State University of New York College of Medicine at New York City, Brooklyn, on Nov. 7. Dr. Jeffcoate delivered the Sir Arcot Mudaliar Lectures in Madras, India, this year and recently completed a visiting professorship at the Royal Prince Albert Hospital in Sydney, Australia. He presently holds appointments at the Liverpool Royal Infirmary, the Liverpool Maternity Hospital, and the Mill Road Maternity Hospital in Liverpool. ——Dr. Matthew Z. Levy has been promoted from assistant professor to associate professor of physiology at the Albany Medical College of Union University. Dr. Levy, who has been on the staff of Albany Medical College since 1952, previously taught in the department of physiology at Western Reserve University School of Medicine, Cleveland.

New York City

Lecture on Neoplastic Diseases.—On Jan. 6 at 3 p. m. "The Role of Hypophysectomy in Cancer of the Breast" will be discussed by Dr. Bronson S. Ray, chief, department of neurosurgery, New York Hospital, and professor of clinical surgery, Cornell University Medical College, in the West Basement Conference Hall at Montefiore Hospital.

Meeting of Cancer Society.—The New York Cancer Society will meet at 8:30 p. m., Jan. 3, 1956, at the New York Academy of Medicine, Fifth Avenue at 103rd St. The following program will be presented:

Investigative Trends in Chemotherapy in Treatment of Melanoma, Sidney Farber, Children's Cancer Research Foundation, Boston.
Current Concepts in the Treatment of Melanoma, Stephen L. Gumport, New York University Post-Graduate Medical School.
Melanoma of the Conjunctiva, Algernon B. Reese, Eye Institute, Columbia-Presbyterian Medical Center.
Discussion, Arthur Purdy Stout, Francis Delafield Hospital, Columbia-Presbyterian Medical Center.

Physicians and medical students are cordially invited to attend.

Dr. Edwards Goes to Yale.—Dr. Herbert R. Edwards, executive director, New York Tuberculosis and Health Association, since 1947, has resigned to become associate professor of medicine and public health, a newly created post at the Yale University School of Medicine, New Haven, Conn. Dr. Edwards will also be consultant on tuberculosis at the Grace-New Haven Community Hospital, where he will direct a William Wirt Winchester Clinic. Dr. Edwards served as clinical instructor in medicine at the Yale school of medicine from 1928 to 1934. In 1926 and 1927 he was medical consultant on a Department of Interior survey of Indian affairs. From 1942 until this year, he was assistant professor of public health at Cornell University Medical College.

NORTH CAROLINA

Memorial Lectureship.—On Nov. 8 the Chi Theta chapter of Phi Rho Sigma at the Bowman Gray School of Medicine of Wake Forest College, Winston-Salem, sponsored the first annual Herbert M. Vann Memorial Lectureship. Dr. Vann, professor of anatomy for more than a quarter of a century, participated actively in affairs of the fraternity as faculty advisor, both on the campus at Wake Forest and after the school of medicine was expanded and moved to Winston-Salem. Joseph Eldridge Markee, Ph.D., professor and chairman of the department of anatomy at Duke University School of Medicine, Durham, was the first lecturer in the annual series.

Personal.—Dr. Emery C. Miller, instructor in internal medicine, Bowman Gray School of Medicine of Wake Forest College, Winston-Salem, has assumed his duties as director of the outpatient department of the North Carolina Baptist Hospital, Winston-Salem, replacing Dr. Charles E. Richards, who has returned to his home state of Nebraska as associate professor of internal medicine at the University of Nebraska, Omaha. Dr. Miller served in Korea and has held appointments as fellow and resident in the Joslin Clinic in Boston and as fellow in internal medicine in the Bowman Gray School of Medicine.——Dr. Lorant Forizs, clinical director, North Carolina alcoholic rehabilitation program, has accepted the position of clinical director with the Florida alcoholic rehabilitation program. Dr. Forizs has served as clinical director for the state hospital in Butner and as clinical assistant professor of psychiatry at the University of North Carolina School of Medicine, Chapel Hill, and has been a lecturer at the Duke University School of Medicine, Durham, and the Yale Summer School of Alcohol Studies, New Haven, Conn. A Hungarian by birth, he held a professorship at Budapest University and fled to Germany before the Russian occupation. Slated to emigrate from Munich, Germany, to America as a displaced person, he had been asked to obligate himself to work a year as a farm laborer in Minnesota. However, through the help of the 98th General Hospital, U. S. Army, where he worked as a civilian psychiatrist, he came to the attention of the North Carolina state hospital program. He expects to make his home in Avon Park, Fla.

OREGON

Hospital News.—The University of Oregon Medical School announces that the University Hospital, which was originally scheduled to admit its first patient in January, will open in

March. Dr. Charles N. Holman has been named medical director and administrator of the University Hospital and Dr. R. Jarvis Gould, administrator of Multnomah Hospital. Dr. Gould, who was named assistant medical director of hospitals and clinics in 1950, will maintain this position as well as his new one. In addition to his new duty, Dr. Holman will continue in his present capacity as medical director for Multnomah Hospital, the University State Tuberculosis Hospital, Doernbecher Memorial Hospital for Children, and the Outpatient Clinic, Portland.

RHODE ISLAND

Dr. Michael Sullivan Honored.—The city of Newport recently dedicated in the name of Dr. Michael H. Sullivan, past-president of the Rhode Island Medical Society, one of the newest schools in the state, a half-million-dollar elementary school that will also serve as a training school for students of Salve Regina College, Newport, who are entering the teaching profession. Dr. Sullivan has been chief of obstetrics at Newport Hospital for more than 50 years.

TEXAS

Personal.—Dr. William M. Campbell, Weatherford, was recently honored when the name of Parker County Hospital was changed to Campbell Memorial Hospital.——Dr. David S. Stayer, Irving, has been appointed to succeed Dr. Wendel A. Stiles, Dallas, who has resigned as a member of the state board of medical examiners. The appointment is for a term to expire April 13, 1957. Dr. Stayer's wife is Dr. Irene M. Stayer.

Visiting Lectureship.—A visiting lectureship has been sponsored by the Texas Radiological Society for the University of Texas School of Medicine, Galveston, Baylor University College of Medicine in Houston, and the Southwestern Medical School of the University of Texas, Dallas. Dr. Franz J. Buschke, Seattle, guest lecturer for the first group of lectures, to be given in January, 1956, will have as his subject, "The Role of Common Sense in Cancer Therapy." Information concerning the date and time of each lecture may be obtained from Dr. Roscoe P. O'Bannon, Fort Worth, secretary-treasurer, or Dr. Martin Schneider, Galveston, president.

Chair in Cardiology.—The University of Texas Postgraduate School of Medicine announces the establishment of the James J. and Una Truitt Chair in Cardiology and its sponsorship of a course in practical bedside cardiology, to be given by Dr. Samuel A. Levine, clinical professor of medicine at Harvard Medical School, Boston, March 14-17, at Houston. Co-sponsors include the Baylor University College of Medicine and the Houston Heart Association. The course will feature the recognition and management of the most common cardiovascular problems in practice. Information may be obtained from the University of Texas Postgraduate School of Medicine, Texas Medical Center, Houston 25.

VIRGINIA

Personal.—Dr. Edward E. Haddock, Richmond, will begin his first term as state senator when the General Assembly convenes in January, 1956. Dr. Haddock has served as a member of the City Council of Richmond and as mayor of Richmond.

Oto-Ophthalmologic Congress.—The Gill Memorial Eye, Ear and Throat Hospital, Roanoke, will hold its 29th annual spring congress in ophthalmology and otolaryngology and allied specialties in Roanoke April 2-7, 1956. Among the guest speakers will be Drs. Rudolf Aebli, New York; Samuel Blank, Philadelphia; John E. Bordley, Baltimore; Virgil G. Casten, Boston; Jack S. Guyton, Detroit; Bayard T. Horton, Rochester, Minn.; Curwood R. Hunter, Cincinnati; John R. Lindsay, Chicago; John E. Magielski, Ann Arbor, Mich.; Stephen J. H. Miller, London, England; Peter A. N. Pastore, Richmond; Herbert J. Rinkel, Kansas City, Mo.; C. Dwight Townes, Louisville, Ky.; Everett R. Veirs, Temple, Texas; and Henry P. Wagener, Rochester, Minn.

WISCONSIN

University Honored.—In a survey of the last 50 years of American medical progress, the American Foundation has cited the University of Wisconsin, Madison, for pioneering in many phases of medical research. Some of the major projects given particular attention are the fundamental work of bacteriologists on nutrition and metabolism of bacteria, work in plant pathology, genetics, human and animal nutrition, the work that led to the discovery of vitamin B_2, heart and cancer research, hormone physiology, the development of bishydroxycoumarin, and work at the Enzyme Institute.

ALASKA

Changing Mortality Rates.—According to Dr. C. Earl Albrecht, Juneau, commissioner of health, Alaska Board of Health, the tuberculosis death rate among the natives dropped from 584.3 per 100,000 population in 1949 to 225.1 in 1954. Accidents are now the chief cause of death, with the proportion of accidental deaths being nearly three times that of the states. Heart diseases are in second place and tuberculosis in third. The territory's births have almost doubled since 1950, with 7,040 recorded in 1954. There were 1,232 deaths reported in 1950 as compared with 1,195 in 1954. The 1950 population figure was 137,000 while last year's was (estimated) 208,000.

Personal.—Two second-generation physicians, having finished their hospital training in the states, are now in Alaska to join their respective fathers in the practice of medicine. Dr. R. Holmes Johnson, who is practicing with his father, Dr. A. Holmes Johnson in Kodiak, was named intern of the year by the Methodist Hospital attending staff in New York City. Dr. J. Donald Rude is established in Juneau with his father, Dr. Joseph O. Rude, and also with Dr. John H. Clements. Dr. Rude served his externship in the Permanente Hospital (now Kaiser Foundation Northern Hospital) in Vancouver, Wash., and his internship at Rochester (N. Y.) General Hospital. During the war he served three years with the Navy in the Pacific.

GENERAL

UNESCO Aids Standardization of Anatomic Terms.—Over 5,600 standard terms in anatomy, printed with the assistance of UNESCO in French, English, and German, were adopted recently in Paris by the International Congress of Anatomists. The result of 60 years' work by anatomists, the "Nomina Anatomica" will greatly facilitate the exchange of information on latest developments in medical science and will eliminate much of the confusion caused by the fact that previously the same structure was often known by three or four different names. The new standard list, which has been distributed to all national anatomical societies, will be of particular worth to specialized branches of surgery.

Prize for Essay in the History of Medicine.—Mr. and Mrs. Henry Schuman of New York offer annually a prize of $250 for an original essay written in English, not to exceed 10,000 words, on some subject pertaining to the history or philosophy of medicine. The essayist must be a doctor of medicine or of one of the medical sciences who has taken his or her M.B., M.D., or Ph.D. degree not more than five years before submission of the paper. The competition is open to candidates of any country. Essays that have won awards in other contests are not eligible. The prize-winning essay will be published in the *Journal of the History of Medicine.* Entries should be submitted on or before May 1, 1956, to Dr. John F. Fulton, Yale University School of Medicine, 333 Cedar St., New Haven 11, Conn.

Symposium on Atomic Energy.—A symposium, "Atomic Energy and Agriculture," sponsored by the Oak Ridge (Tenn.) Institute of Nuclear Studies and the American Association for the Advancement of Science, was presented Dec. 22-29 at the Municipal Auditorium, Atlanta, Ga., under the chairmanship of Cyril L. Comar, Ph.D., chief, biomedical research, Oak Ridge Institute of Nuclear Studies. The Thursday afternoon session included discussions on radiation facilities designed to process commercial quantities of food products; the design of a megacurie radiation source; the effect of irradiation sterilization on protein, carbohydrate, and fat with particular reference to their nutritive value; toxicological studies on food sterilized by ionizing radiations; present-day status of radiation sterilization; and feasibility of food irradiation.

International Research Council.—Dr. Hamilton Cameron, New York City, who in January, 1953, became one of 600,000 hemiplegic aphasics, recently incorporated the International Research Council, the first world-wide medical confraternity for the dissemination of knowledge concerning aphasias associated with hemiplegia. The aims of the council include: the coordination of factual clinical data regarding the classification of aphasia; the establishment of a clearing house on the subject; publication of a monthly *Review-Bulletin;* the building of a library of books, publications, and reprints concerned with this specialized subject; and the securing of funds for the continuance of its work by voluntary subscription. Information may be obtained from Dr. Hamilton Cameron, Founder and General Director, 601 W. 110th St., New York City 25.

Essay Contest.—The Council on Undergraduate Medical Education of the American College of Chest Physicians offers three cash awards ($250, $100, and $50) annually for the best contributions prepared by undergraduate medical students on any phase in the diagnosis and treatment of chest diseases (heart and/or lungs). The winning contributions for 1956 will be announced at the 22nd annual meeting of the American College of Chest Physicians in Chicago, June 7-10, 1956. The following conditions must be observed: (1) completion of an application form, which may be obtained by writing to the Executive Director, American College of Chest Physicians, 112 E. Chestnut St., Chicago 11; (2) submission of five copies of the manuscript typewritten in English (double-spaced) to the college offices in Chicago not later than April 10, 1956; and (3) identification of the author by a motto or other device on the title page and a sealed envelope bearing the same motto on the outside and with the name and address of the author enclosed.

Medical Research Group Honors Transatlantic Airline.—The Animal Care Panel of the National Society for Medical Research recently presented Seaboard & Western Airlines, pioneer transatlantic all-cargo carrier, an award for its role in the air transport of animals used for medical research. In presenting the award, Nathan R. Brewer, D.V.M., in charge of central animal quarters at the University of Chicago and president of the panel, stated that his group, composed of technical and professional people interested in the care and handling of laboratory animals, believes "that man owes a responsibility to animals used for his benefit, and laboratory animals have contributed and continue to contribute an immense store to human knowledge and welfare." The award read, in part, "For facilitating medical research and medical progress through efficient and excellent care of vitally needed laboratory animals." Seaboard & Western played a prominent role in the air movement of rhesus monkeys used in the development and production of the Salk vaccine.

New Quarterly on Mental Health.—The first issue of a quarterly journal, *Behavioral Science,* official publication of the new Mental Health Research Institute at the University of Michigan, Ann Arbor, will appear in January, 1956. It will contain articles on general theories of behavior and on empirical research specifically oriented toward such theories. An interdisciplinary approach to problems of behavior will be stressed. Although the scope of the journal will include all aspects of behavior that can be subsumed under broadly general interdisciplinary theory, special emphasis will be placed on contributions relating to research in mental health and disease. The editorial board will include the following physicians: Dr. Franz Alexander (psychoanalysis), Dr. Ralph W. Gerard (neurophysiology), Dr. James G. Miller (psychology and psychiatry), Chicago, and Dr. Raymond W. Waggoner, Ann Arbor (psychiatry). Subscriptions will be $6 a year. Manuscripts and subscriptions may be sent in care of Dr. James G. Miller, Mental Health Research Institute, University of Michigan, Ann Arbor, Mich.

Leukemia Society Grants.—In announcing recent grants in aid for leukemia research projects in the United States and England, Mrs. Rudolph Roesler de Villiers, president of the Leukemia Society, Inc., pointed out that the disease is today the fourth largest killer of children in New York City, with proportionately high incidence in other parts of the country. The grants, totaling $4,000, the first of a series that the society has instituted since changing its name from Robert Roesler de Villiers Foundation, Inc., mark the organization's broadening of scope consistent with the world-wide aspects of the disease. Awards were made to Drs. James F. Holland and Avery A. Sandberg, associate chiefs of medicine at Roswell Park Memorial Institute of Buffalo, to pursue their studies of the biochemical characteristics of the disease; Dr. Robert F. Schilling, assistant professor, department of medicine, University of Wisconsin Medical School, Madison, for studies of human bone marrow in relation to leukemia; Dr. Stuart C. Finch, Yale University School of Medicine, New Haven, Conn., to continue studies on the transmittal of leukemia in rats; and Dr. Robert H. Mole of the Atomic Energy Research Establishment, Harwell, England, for studies on the effects of irradiation on leukemia.

Group Studies Poliomyelitis Vaccination.—The Study Group on Poliomyelitis Vaccination called by the World Health Organization for a recent meeting in Stockholm, Sweden, reports that about 10 million children in five countries have been vaccinated against poliomyelitis with no ill effects, apart from the comparatively few cases in the United States that were traced to the use of certain batches of faulty vaccines. According to the study group, whereas vaccine of the Salk type has been shown to give good protection to children between the ages of 6 to 10 years, this is the only age group for which sufficient evidence is available to allow a definite opinion to be expressed. It is not yet possible to say how long the immunity conferred by vaccination can last. A 40-page report prepared by the group will be submitted to the director-general of the World Health Organization, who will decide how it can best be used for the guidance of health authorities all over the world. The group included Drs. Alexander D. Langmuir, chief epidemiology branch, Communicable Disease Centre, Atlanta, Ga.; Prof. John R. Paul, Yale University School of Medicine, New Haven, Conn.; and Dr. Albert B. Sabin, Children's Hospital Research Foundation, University of Cincinnati College of Medicine.

Mortality Figures.—According to the Metropolitan Life Insurance Company, 1 Madison Ave., New York City, the experience of its industrial policy holders indicates that prevailing mortality among Americans in the middle and later age groups is much lower than two decades ago. Among those insured, the death rate from all causes for white men at ages 45-74 fell from 29.9 per 1,000 in 1935 to 22.5 in 1954, a decline of 25%. The corresponding decrease among white women was even greater—from 21.6 to 12.2 per 1,000, or nearly 45%. For each sex, the relative improvement in mortality was somewhat greater at ages 45-54 than at the later ages. The greatest reductions in mortality have been recorded for the infectious diseases, reflecting the revolutionary advances made in their treatment with the newer drugs and antibiotics. The death rates from pneumonia and influenza and from tuberculosis at the ages past midlife have fallen to fractions of what they were 20 years ago. Great progress has also been made in reducing the mortality from diseases of the heart and kidneys. Between 1935 and 1939 and 1950 and 1954, the decrease was about 30% among the insured women in each age group within the 45-74 range; among the men the reduction in the death rate from these diseases amounted to 5% at ages 55-64 and 16% at ages 65-74. The mortality from cancer decreased fully one-sixth among the insured women in the 45-74 age range; among the men, however, the cancer death rate increased somewhat, reflecting the sharp upward trend in the recorded mortality from respiratory cancer. The death rate from accidents has greatly improved over the 20-year period in the insurance experience.

FOREIGN

Meeting on Internal Medicine.—The fourth International Congress of Internal Medicine will be held in Madrid, Spain, Sept. 19-23, 1956. The main subjects will be "The Role of the Adrenals in the Pathogenesis and Evolution of Internal Diseases" and

"Bronchial Asthma and Emphysema." Communications on these themes or on any others of free choice will be accepted. Please address all inquiries to the Secretariat: Drs. J. C. de Oya and J. Gimena, Hortaleza n° 90.

Cancer Meeting in Paris.—At an international conference called by UNESCO in Paris, France, Dec. 12-16, 1955, to decide the organization's role in the world-wide problem of cancer, Dr. Harold L. Stewart of the National Cancer Institute, Bethesda, Md., and Dr. Harold P. Rusch, director of McArdle Memorial Laboratory at the University of Wisconsin, Madison, represented the United States. About 20 conference members were present from England, Denmark, Germany, the Netherlands, Switzerland, France, India, and Israel.

Seminar Congresses in Ophthalmology.—In its seminar congresses in ophthalmology the American Medical Society of Vienna, Austria, will present the following programs by the medical faculty of the University of Vienna:

Feb. 1-3, Tumors of the Eye; External Diseases of the Eye; Fundus Microscopy.
March 1-3, Anatomy of the Orbit and Adnexa; Indirect Ophthalmoscopy; Gross Pathology.
April 5-7, Histology of the Eye; Histopathology of the Eye; Ocular Muscle Anomalies.
May 3-5, Refraction, Ocular Motility; Perimetry.
June 7-9, Plastic Surgery of the Eye; External Diseases of the Eye; Glaucoma.
July 5-7, Slit Lamp Microscopy; Ophthalmoscopy; Ocular Therapeutics.
Aug. 2-4, Electrosurgical Treatment of the Eye; Ocular Cataracts; Retinal Detachment.
Sept. 6-8, Operative Ophthalmology; Gonioscopy; Anomalies.
Oct. 4-6, Neuroophthalmology; Diseases of the Retina; Physiology of the Eye.
Nov. 8-10, Ophthalmic Medicine; Diagnostic Examination; The Ocular Adnexa (Selected Topics).

Details may be obtained from the American Medical Society of Vienna, 1. Vienna, Universitaetsstrasse 11. Cable, "Ammedic," Vienna.

MEETINGS

AMERICAN MEDICAL ASSOCIATION: Dr. George F. Lull, 535 North Dearborn St., Chicago 10, Secretary.

1956 Annual Meeting, Chicago, June 11-15.

1956 Clinical Meeting, Seattle, Nov. 27-30.

1957 Annual Meeting, New York, June 3-7.

1957 Clinical Meeting, Philadelphia, Dec. 3-6.

1958 Annual Meeting, San Francisco, June 23-27.

Annual Congress on Industrial Health, Sheraton-Cadillac Hotel, Detroit, Jan. 23-24. Mr. Clark D. Bridges, 535 N. Dearborn St., Chicago 10, Acting Secretary.

Annual Congress on Medical Education and Licensure, Palmer House, Chicago, Feb. 11-14. Dr. Edward L. Turner, 535 North Dearborn St., Chicago 10, Secretary.

Alaska Territorial Medical Association, Alaska Native Health Service Hospital, Anchorage, Feb. 20-22. Dr. Robert B. Wilkins, 1121 Fourth Ave., Anchorage, Secretary.

American Academy of Allergy, Chase Hotel, St. Louis, Feb. 6-8. Dr. Francis C. Lowell, 65 East Newton St., Boston, Secretary.

American Academy of Occupational Medicine, Netherlands-Plaza Hotel, Cincinnati, Feb. 15-17. Dr. Leonard J. Goldwater, 600 W. 168th St., New York 32, Secretary.

American Academy of Orthopaedic Surgeons, Palmer House, Chicago, Jan. 28-Feb. 2. Dr. John R. Norcross, 122 South Michigan Blvd., Chicago 3, Secretary.

American College of Radiology, Drake Hotel, Chicago, Feb. 10-11. Mr. William C. Stronach, 20 North Wacker Drive, Chicago 6, Executive Secretary.

American Society for Surgery of the Hand, Chicago, Jan. 27. Dr. George V. Webster, 1145 East Green St., Pasadena 1, Calif., Secretary.

Central Surgical Association, Hotel Kahler, Rochester, Minn., Feb. 23-25. Dr. Charles D. Branch, 102 North St., Peoria, Ill., Secretary.

Eastern Section, American Laryngological, Rhinological and Otological Society, Boston, Jan. 13. Dr. John A. Murtagh, Dartmouth College, Hanover, N. H., Vice President.

Los Angeles Midwinter Medical Convention, Biltmore Hotel, Los Angeles, Jan. 3-5. Dr. Paul D. Foster, 1925 Wilshire Blvd., Los Angeles 58, General Chairman.

Medical Society Executives Conference, Drake Hotel, Chicago, Feb. 6-8. Mr. H. Martin Baker, 1102 South Hillside, Wichita 17, Kansas, Secretary.

Middle Section, American Laryngological, Rhinological and Otological Society, Netherland Plaza, Cincinnati, Jan. 16. Dr. William H. Craddock, 2328 Auburn Ave., Cincinnati 19, Vice President.

Neurosurgical Society of America, Hotel Key Biscayne, Key Biscayne, Miami, Fla., Jan. 18-21. Dr. Lester A. Mount, 700 West 168th St., New York 32, Secretary.

Northwest Society for Clinical Research, University of Oregon Medical School, Portland, Ore., Jan 21. Dr. Arthur L. Rogers, 1216 S.W. Yamhill St., Portland 5, Ore., Secretary.

Regional Meetings, American College of Physicians:

Shreveport, La., Jan. 14. Dr. M. D. Hargrove, 803 Jordan St., Shreveport, La., Governor.

Philadelphia, Jan. 27. Dr. Thomas M. McMillan, 330 South 9th St., Philadelphia 7, Governor.

Saskatoon, Sask., Feb. 3-4. Dr. C. H. A. Walton, Winnipeg Clinic, Winnipeg, Man., Canada, Governor.

Tucson, Ariz., Feb. 11. Dr. Leslie R. Kober, 15 East Monroe St., Phoenix, Ariz., Governor.

Sectional Meetings, American College of Surgeons:

Jacksonville, Fla., Hotel George Washington, Jan. 16-18. Dr. Kenneth A. Morris, 2522 Oak St., Jacksonville 4, Fla., Chairman.

Philadelphia, The Bellevue-Stratford, Feb. 13-16. Dr. Calvin M. Smyth Jr., Abington Memorial Hospital, Abington, Pa., Chairman.

Society of University Surgeons, Hotel Claypool, Indianapolis, Feb. 8-10. Dr. C. Rollins Hanlon, 1325 South Grand Blvd., St. Louis 4, Secretary.

South Atlantic Association of Obstetricians and Gynecologists, Hollywood Beach Hotel, Hollywood, Fla., Jan. 28-Feb. 1. Dr. C. H. Mauzy, Bowman Gray School of Medicine, Winston-Salem, N. C., Secretary.

Southern Section, American Federation for Clinical Research, Jung Hotel, New Orleans, Jan. 20. Dr. John H. Moyer, 1200 M.D. Anderson Blvd., Houston, Texas, Secretary.

Southern Section, American Laryngological, Rhinological and Otological Society, The Shamrock, Houston, Texas, Jan. 27-28. Dr. J. M. Robison, 1304 Walker Ave., Houston 2, Texas, Chairman.

U. S. Section, International College of Surgeons, Regional Meeting, Greenbrier Hotel, White Sulphur Springs, W. Va., Feb. 12-15. Dr. E. G. Gill, 711 South Jefferson St., Roanoke, Va., Chairman.

Western Section, American Federation for Clinical Research, Golden Bough Theater, Carmel, Calif., Jan. 26. Dr. Charles M. Grossman, 301 Selling Bldg., Portland 5, Ore., Secretary.

Western Section, American Laryngological, Rhinological and Otological Society, County Medical Society Bldg., San Francisco, Jan. 21. Dr. David D. DeWeese, 1216 S. W. Yamhill St., Portland, Ore., Vice President.

Western Society for Clinical Research, Carmel-by-the-Sea, Calif., Jan. 27-28. Dr. Arthur J. Seaman, University of Oregon Medical School, Portland 1, Ore., Secretary.

FOREIGN AND INTERNATIONAL

All India Medical Conference, Jaipur, India, Dec. 26-28. Dr. B. N. Consul, Association Bldg., S.M.S. Hospital Premises, Jaipur, India, Organizing Secretary.

Canadian Medical Association, Quebec, P. Q., Canada, June 10-14, 1956. Dr. Arthur D. Kelly, 150 St. George St., Toronto 5, Ont., Canada, Secretary.

Conference of International Union for Health Education of the Public, Rome, Italy, April 27-May 5, 1956. Mr. Lucien Viborel, 92 rue St. Denis, Paris 1er, France, Secretary-General.

Congress of International Anesthesia Research Society, Miami Beach, Fla., U.S.A., April 9-12, 1956. For information write: Dr. R. J. Whitacre, 13951 Terrace Road, Cleveland 12, Ohio, U. S. A.

Congress of International Association of Limnology, Helsinki, Finland, July 26-Aug. 7, 1956. For information address: Dr. H. Luther, Snellmansgatan 16 C 36, Helsinki, Finland.

Congress of International Association of Logopedics and Phoniatrics, Barcelona, Spain, Sept. 3-7, 1956. Dr. J. Perello, Provenza 319, Barcelona 9, Spain, Secretary-General.

Congress of International Society of Hematology, Hotel Somerset, Boston, Mass., U.S.A., Aug. 27-Sept. 1, 1956. Dr. W. C. Moloney, 39 Bay State Road, Boston, Mass., U.S.A., Secretary.

Congress of Latin Society of Ophthalmology, Madrid, Spain, April 24-28, 1956. For information address: Dr. Costi, Montalban 3, Madrid, Spain.

European Congress of Allergology, Florence, Italy, Sept. 12-15, 1956. Prof. Umberto Serafini, Instituto de Patologia Medica, Viale Morgagni, Florence, Italy, Secretary-General.

European Congress of Cardiology, Stockholm, Sweden, Sept. 10-14, 1956. Dr. Karl Erik Grewin, Sodersjukhuset, Stockholm, Sweden, General Secretary.

European Symposium on Vitamin B_{12}, Hamburg, Germany, May, 1956. For information write: Doz. Dr. H. Bauer, Nervenklinik, Hamburg-Eppendorf, Germany.

Health Congress, Royal Society for the Promotion of Health, Blackpool, England, April 24-27, 1956. Mr. P. Arthur Wells, 90 Buckingham Palace Road, London S.W. 1, England, Secretary.

Inter-American Congress of Cardiology, Havana, Cuba, Nov. 4-10, 1956. For information address: Dr. Ramon Aixala, Apartado 2108, Havana, Cuba.

International Academy of Pathology, Cincinnati, Ohio, U. S. A., April 24-25, 1956. Dr. F. K. Mostofi, Armed Forces Institute of Pathology, Washington 25, D. C., U. S. A., Secretary.

International Congress Against Alcoholism, Istanbul, Turkey, Sept. 10-15, 1956. For information address: International contre l'Alcoolisme, Case Gare 49, Lausanne, Switzerland.

International Congress on Animal Reproduction, Arts School, University of Cambridge, Cambridge, England, June 25-30, 1956. Dr. Joseph Edwards, Production Division, Milk Marketing Board, Thames Ditton, Surrey, England, Hon. Secretary.

International Congress of Anthropological and Ethnological Sciences, Philadelphia, Pa., U. S. A., Sept. 2-9, 1956. Dr. William N. Fenton, National Research Council, Division of Anthropology and Psychology, 2101 Constitution Avenue, Washington 25, D. C., U. S. A., Secretary-General.

International Congress of Dietetics, Congress Palace, Esposizione Universale Roma, Rome, Italy, Sept. 10-14, 1956. Prof. E. Serianni, Associazione Dietetica, Italiana, via dei Penitenzieri N. 13, Rome, Italy, Secretary General.

International Congress on Diseases of the Chest, Cologne, Germany, Aug. 19-23, 1956. Mr. Murray Kornfeld, 112 East Chestnut St., Chicago 11, Illinois, U. S. A., Executive Director.

International Congress of Entomology, Montreal, Canada, Aug. 17-25, 1956. Mr. J. A. Downes, Science Service Bldg., Carling Ave., Ottawa, Ont., Canada, Secretary.

International Congress of Gastroenterology, London, England, July 18-21, 1956. Mr. Hermon Taylor, London Hospital, White Chapel, London E.1, England, Honorable Secretary.

International Congress of Health Technicians, Maison de la Mutualite, Paris, France, June 5-8, 1956. For information address: Mr. M. H. Thoillier, 37 Rue de Monthlon, Paris 9e, France.

International Congress for the History of Science, Florence and Milan, Italy, Sept. 3-10, 1956. Dr. M. L. Bonelli, Instituto di Ottica, Arcetri, Florence, Italy, Secretary-General.

International Congress of Human Genetics, Copenhagen, Denmark, Aug. 1-6, 1956. For information address: The University Institute for Human Genetics, Tagensvej 14, Copenhagen N, Denmark.

International Congress of Hydatid Disease, Athens, Greece, Sept. 14-18, 1956. Prof. B. Kourias, Croix-Rouge Hellenique, 1 rue Mackenzie King, Athens, Greece, Secretary-General.

International Congress of Internal Medicine, Madrid, Spain, Sept. 19-23, 1956. Dr. J. C. De Oya and Dr. J. Gimena, Hostaleza No. 90, Madrid, Spain, Secretaries.

International Congress of International College of Surgeons, Palmer House, Chicago, Illinois, U. S. A., Sept. 9-13, 1956. Dr. Max Thorek, 1516 Lake Shore Drive, Chicago, Illinois, U. S. A., Secretary-General.

International Congress of Neo-Hippocratic Medicine, Montecatini, Terme, Italy, May 20-22, 1956. Dr. Valente, 41 Avenue Verdi, Montecatini Terme, Italy, Secretary-General.

International Congress of Paediatrics, Copenhagen, Denmark, July 22-27, 1956. Professor P. Plum, Rigshospitalet, Copenhagen, Denmark, President.

International Congress of Physical Medicine, Copenhagen, Denmark, August 20-24, 1956. Dr. B. Strandberg, Kobenhavns amts sygehus i Gentofte, Dept. of Rheumatology and Physical Medicine, Hellerup, Denmark, Honorable Secretary.

International Congress of Radiology, Mexico, D. F., Mexico, July 22-28, 1956. Dr. Jose Noriega, Tepic 126 (2e piso), Mexico, D. F. 7, Mexico, Secretary General.

International Congress of World Confederation for Physical Therapy, Hotel Statler, New York, New York, U. S. A., June 17-23, 1956. For information address: Miss Mildred Elson, American Physical Therapy Association, 1790 Broadway, New York 19, New York, U. S. A.

International Genetics Symposium, Tokyo and Kyoto, Japan, Sept. 6-12, 1956. For information address: Secretary, International Genetics Symposium, Science Council of Japan, Ueno Park, Tokyo, Japan.

International Physiological Congress, Brussels, Belgium, July 29-Aug. 5, 1956. For information address: Prof. J. Reuse, Faculte de Medicine et de Pharmacie, 115 Boulevard de Waterloo, Brussels, Belgium.

International Professional Union of Gynecologists and Obstetricians, Madrid, Spain, Sept. 28-29, 1956. Dr. Jacques Courtois, 1 rue Racine, St-Germain-en-Laye (S and O), France, Permanent International Secretary-General.

International Symposium on Venereal Diseases and the Treponematoses, Hotel Statler, Washington, D. C., U. S. A., May 28-June 1, 1956. For information address: Dr. Charles A. Smith, Chief, Venereal Disease Program, Division of Special Health Services, Public Health Service, Dept. of Health, Education and Welfare, Washington 25, D. C., U. S. A.

Latin American Congress of Physical Medicine, San Juan, Puerto Rico and Curacao, N.W.1., Jan. 29-Feb. 8, 1956. Dr. Cassius Lopez de Victoria, 176 East 71st St., New York 21, New York, U. S. A., Executive Director.

Medical Women's International Association, Extraordinary General Assembly, Burgenstock, Nidwalden, Switzerland, Sept. 21-23, 1956. Dr. Janet Aitken, 30a Acacia Road, London N.W. 1, England, Secretary.

Middle East Medical Assembly, Campus, American University of Beirut, Beirut, Lebanon, April 7-9, 1956. Dr. Virgil C. Scott, American University of Beirut, Beirut, Lebanon, Chairman.

National Congress of Pediatrics, Cuidad Universitaria, Mexico D.F., Mexico, May 1-5, 1956. Dr. Ignacio Avila Cisneros, Calzada de Madereros No. 240, Mexico 18, D.F., Mexico, Coordinator.

North Queensland Medical Conference, Cairns, North Queensland, Australia, June 25-30, 1956. Dr. W. R. Horsfall, P.O Box 672, Cairns, N.Q., Australia, Secretary.

Pan-American Academy of General Practice, San Juan, Puerto Rico and Curacao, N.W.1., Jan. 29-Feb. 8, 1956. Dr. Arturo Martinez, 54 East 72d St., New York 21, New York, U. S. A., Secretary.

Pan American Congress of Gastroenterology, Havana, Cuba, Jan. 20-27, 1956. For information address: Dr. Norberto M. Stapler, 1267 J. E. Uriburu, Buenos Aires, Argentine, S. A.

Pan American Congress of Ophthalmology, Santiago, Chile, S. A., Jan. 9-14, 1956. Dr. Rene Contardo, Huerfanos 930, Of. 74, Santiago, Chile, Secretary General.

Pan American Congress of Otorhinolaryngology and Bronchoesophagology, San Juan, Puerto Rico, April 8-12, 1956. Dr. C. E. Munoz MacCormick, Apartado 9111, Santurce 29, Puerto Rico, Secretary General.

Pan American Medical Women's Alliance, Santiago, Chile, March 6-13, 1956. For information address: Dr. Eva Cutright, 458 Beall Ave., Wooster, Ohio, U. S. A.

World Congress on Fertility and Sterility, Naples, Italy, May 18-26, 1956. Dr. Maxwell Roland, 114-20 Queens Boulevard, Forest Hills 75, New York, N. Y., U. S. A., Chairman, Liaison Committee.

World Medical Association, Havana, Cuba, Oct. 9-15, 1956. Dr. Louis H. Bauer, 345 East 46th St., New York 17, New York, U. S. A., Secretary-General.

EXAMINATIONS AND LICENSURE

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Various Centers.* April 24-25 (Part II); June 19-20 (Parts I and II); September 4-5 (Part I). Candidates may file applications at any time but they must be received at least six weeks before the date of the examination for which application is made. New candidates should apply by formal registration; registered candidates may notify the board, indicating desired location, date and candidate number. Ex. Sec., Dr. John P. Hubbard, 133 South 36th St., Philadelphia 4.

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination.* Montgomery, June 19-21. Sec., Dr. D. G. Gill, State Office Bldg., Montgomery.

Arizona:* *Examination.* Phoenix, Jan. 18-19. *Reciprocity.* Phoenix, Jan. 21. Sec., Dr. M. R. Richter, 411 Security Bldg., Phoenix.

Arkansas:* *Examination.* Little Rock, June 14-15. Sec., Dr. Joe Verser, Harrisburg.

California: *Examination.* Los Angeles, Feb. 27-Mar. 1. Sec., Dr. Louis E. Jones, 1020 N St., Room 436, Sacramento.

Connecticut:* *Examination.* New Haven, March 12-14. Sec., Dr. Creighton Barker, 160 St. Ronan St., New Haven.

Delaware: *Examination.* Dover, Jan. 10-12. *Reciprocity.* Dover, Jan. 19. Sec., Dr. Joseph S. McDaniel, Dover.

District of Columbia:* *Examination.* Washington, May 14-15. Deputy Director, Mr. Paul Foley, 1740 Massachusetts Ave., N.W., Washington.

Florida:* *Examination.* Miami Beach, June 24-26. Sec., Dr. Homer L. Pearson, 901 N.W. 17th St., Miami 36.

Georgia: *Examination and Reciprocity.* Atlanta, June. Sec., Mr. Cecil L. Clifton, 111 State Capitol, Atlanta 3.

Idaho: *Examination and Reciprocity.* Boise, Jan. 9-11. Exec. Sec., Mr. Armand L. Bird, 364 Sonna Bldg., Boise.

Illinois: *Examination and Reciprocity.* Chicago, Jan. 24-26. Supt. of Regis., Mr. Frederic B. Selcke, Capitol Building, Springfield.

Indiana: *Examination.* Indianapolis, June. Exec. Sec., Miss Ruth V. Kirk, 538 K. of P. Bldg., Indianapolis.

Maine: *Examination.* Portland, Mar. 13-14. Sec., Dr. Adam P. Leighton, 192 State St., Portland.

Michigan:* *Examination.* Ann Arbor and Detroit, June 13-15. Sec., Dr. E. C. Swanson, 118 Stevens T. Mason Bldg., Lansing.

Minnesota:* *Examination.* Minneapolis, Jan. 17-19. Sec., Dr. F. H. Magney, 230 Lowry Medical Arts Bldg., St. Paul 2.

Montana: *Examination and Reciprocity.* Helena, April 3. Sec., Dr. S. A. Cooney, 7 West 6th Ave., Helena.

Nebraska:* *Examination.* Omaha, June 18-20. Director, Bureau of Examining Boards, Mr. Husted K. Watson, 1009 State Capitol Bldg., Lincoln.

Nevada:* *Examination and Reciprocity.* Reno, Jan. 3. Sec., Dr. G. H. Ross, 112 N. Curry St., Carson City.

New Hampshire: *Examination and Endorsement.* Concord, March 14. Sec., Dr. John S. Wheeler, 107 State House, Concord.

New Jersey: *Examination.* Trenton, June 19-22. Sec., Dr. Patrick H. Corrigan, 28 W. State St., Trenton.

New York: *Examination.* Albany, Buffalo, Syracuse and New York, Feb. 7-10. Sec., Dr. Stiles D. Ezell, 23 S. Pearl St., Albany.

North Carolina: *Reciprocity.* Durham, Jan. 16. *Examination.* Durham, June 18-21. Sec., Dr. Joseph J. Combs, Professional Bldg., Raleigh.

North Dakota: *Examination.* Grand Forks, Jan. 4-6. *Reciprocity.* Grand Forks, Jan. 7. Sec., Dr. C. J. Glaspel, Box 228, Grafton.

Oklahoma:* *Examination.* Oklahoma City, June 5-6. Sec., Dr. E. F. Lester, 813 Braniff Bldg., Oklahoma City.

Oregon:* *Examination.* Portland, Jan. 16-17. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg., Portland.

Pennsylvania: *Examination.* Philadelphia, Jan. 23-26. Acting Sec., Miss Marguerite G. Steiner, Box 911, Harrisburg.

Rhode Island:* *Examination.* Providence, Jan. 5-6. Admin. of Professional Education, Mr. Thomas B. Casey, Room 366, State Office Bldg., Providence 2.

South Dakota:* *Examination.* Sioux Falls, Jan. 17-18. Exec. Sec., Mr. John C. Foster, 300 First National Bank Bldg., Sioux Falls.

Texas:* *Examination and Reciprocity.* Fort Worth, June 18-20. Sec., Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth 2.

Utah: *Reciprocity.* Salt Lake City, Feb. 21. *Examination.* Salt Lake City, July 11-13. Director, Mr. Frank E. Lees, 324 State Capitol Bldg., Salt Lake City 1.

Washington:* *Examination.* Seattle, Jan. 9-11. *Reciprocity.* Seattle, Jan. 8. Secretary, Department of Licenses, Mr. Edward C. Dohm, Olympia.

West Virginia: *Examination and Reciprocity.* Charleston, Jan. 9-11. Sec., Dr. Newman H. Dyer, State Office Bldg., No. 3, Charleston 5.

Wisconsin:* *Reciprocity and Examination.* Madison, Jan. 10-12; *Reciprocity,* Madison, Spring; *Reciprocity and Examination.* Milwaukee, July 10-12. Sec., Dr. Thomas W. Tormey, Jr., 1140 State Office Bldg., Madison.

Wyoming: *Examination and Endorsement. Cheyenne, Feb. 6. Sec., Dr.* Franklin D. Yoder, State Office Bldg., Cheyenne.

Alaska:* On application. Sec., Dr. W. M. Whitehead, 172 South Franklin St., Juneau.

Guam. *Endorsement.* Agana, Jan. 2. The Commission on Licensure will meet whenever a candidate appears or submits his credentials. Sec., Dr. John E. Kennedy, Agana.

Hawaii: *Examination.* Honolulu, Jan. 9-12. Sec., Dr. I. L. Tilden, 1020 Kapiolani, St., Honolulu.

Puerto Rico: *Examination.* San Juan, Mar. 6-11. Sec., Dr. Joaquin Mercado Cruz, Box 3271, San Juan.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Arkansas: *Examination.* Little Rock, May 4-5. Sec., Mr. S. C. Dellinger, Zoology Department, University of Arkansas, Fayetteville.

Connecticut: *Examination.* New Haven, Feb. 11. Address: State Board of Healing Arts, 258 Bradley St., New Haven 10.

District of Columbia: *Examination.* Washington, April 23-24. Deputy Director, Mr. Paul Foley, 1740 Massachusetts Ave. N.W., Washington 6.

Florida: *Examination.* Miami, June 9. Sec., Mr. M. W. Emmel, Box 340, Gainesville.

Iowa: *Examination.* Des Moines, Jan. 10. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: *Reciprocity.* Lansing, Jan. 10. *Examination.* Detroit and Ann Arbor, Feb. 10-11. Sec., Mrs. Anne Baker, 410 W. Michigan Ave., Lansing 15.

Minnesota: *Examination.* Minneapolis, Jan. 3-4. Sec., Dr. Raymond N. Bieter, 126 Millard Hall, University of Minnesota, Minneapolis.

Nebraska: *Examination.* Omaha, Jan. 10-11. Sec., Mr. Husted K. Watson, Room 1009, State Capitol Bldg., Lincoln 9.

Nevada: *Examination.* Reno, Jan. 3. Sec., Dr. Donald G. Cooney, Box 9005, University Station, Reno.

New Mexico: *Examination.* Santa Fe, Jan. 15. *Reciprocity.* Sec., Mrs. Marguerite Cantrell, Box 1522, Santa Fe.

Oklahoma: *Examination and Reciprocity.* Oklahoma City, Mar. 30-31. Sec., Dr. E. F. Lester, 813 Braniff Bldg., Oklahoma City.

Oregon: *Examination.* Portland, March 3; June 2. Sept. 8 and Dec. 1. Dr. Earl M. Pallett, Sec., State Board of Higher Education, Eugene.

Rhode Island: *Examination.* Providence, Feb. 15. Admin. of Professional Regulation, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

Tennessee: *Examination.* Memphis, Mar. 21-22. Sec., Mr. O. W. Hyman, 62 S. Dunlap St., Memphis 3.

Texas: *Examination.* Galveston, Dallas, and such other locations as are warranted, April. Sec., Bro. Raphael Wilson, 407 Perry-Brooks Bldg., Austin.

Washington: *Examination.* Seattle, Jan. 4-5. Secretary, Department of Licenses, Mr. Edward C. Dohm, Olympia.

Wisconsin: *Examination.* Madison, April 7 and Milwaukee, June 2. Final date for filing application is Mar. 30. Sec., Dr. W. H. Barber, 621 Ransom St., Ripon.

Alaska: On application. Juneau or other towns in Territory as decided by Board. *Reciprocity.* On application. Sec., Dr. C. Earl Albrecht, Box 1931, Juneau.

---

*Basic Science Certificate required.

MAGAZINE–TELEVISION REPORT

The following list of current medical articles in mass-circulation magazines and forthcoming network television programs on medical subjects is published each week only for the information of readers of The Journal. *Unless specifically stated, the American Medical Association neither approves nor disapproves of the articles and programs reported.*

TELEVISION

Monday, Jan. 9

NBC-TV, 11 a. m. to 12 noon EST. "Medical and Health News with Howard Whitman," a segment of the "Home" show.

ABC-TV, 9:30 p. m. EST. "Medical Horizons" goes to the University of Colorado School of Medicine at Denver for a report on accident proneness. Presented in cooperation with the American Medical Association.

Tuesday, Jan. 10

ABC-TV, 9:30 p. m. EST. "DuPont's Cavalcade Theater" repeats "Night Call"—a teleplay about 24 hours in the life of a general practitioner.

MAGAZINES

Family Circle, January, 1956

"How to Enrich Your Husband's Life," by Mort Weisinger

Dr. Elmer Hess, President of the American Medical Association, is one of 10 authorities giving advice to housewives. Dr. Hess tells "how to help keep your husband healthy."

"I Face an Operation," by Mary Phillips

A woman facing major surgery discovers the advances that have been made in procedure, anesthetics, and postoperative care and, as a result, attains the confident attitude that reduces operating-room dangers and speeds recovery.

Reader's Digest, January, 1956

"The Miracle of Muscle," by J. D. Ratcliff

"Muscles are fabulously complicated, not yet completely understood by science, and worthy of your thoughtful care." Condensed from *Today's Health,* this article explains what is known about muscles and suggests ways to keep them in trim.

"Why Not Music Like This in All Hospitals," by William S. Dutton

In 15 Philadelphia hospitals, a music program conducted by the Gray Ladies has brought comfort and diversion to ward patients.

"Why Doctors Face So Many Lawsuits," by Louis J. Regan, M.D., LL.B.

Dr. Regan, in an article condensed from *Look,* points out that "there has been no increase in actual malpractice, although there has been a staggering increase in the number of malpractice claims." He says: "Many unjustified malpractice claims could be avoided if patients would keep in mind what results can reasonably be expected from medical treatment and obtain expert opinion before bringing suit."

"Courage Is Not a Sometime Thing," by William J. Coughlin

Doctors are interested in the physical condition of George F. Smith, the first test pilot to live after bailing out of a plane going at supersonic speed.

GOVERNMENT SERVICES

ARMY

Stepped-Up Promotions for Medical Officers.—The Army Surgeon General, Major Gen. Silas B. Hays, announces that under revised promotion policies, physicians will be eligible for temporary promotion to the grade of major, lieutenant colonel, and colonel one year sooner than other Army officers.

As a result of the policy, it is estimated that 390 medical officers will be promoted to higher grades during the period ending June 30, 1956. Consideration is also being given to more rapid promotion of lieutenants to the grade of captain.

The action gives additional recognition to the long and expensive training required of doctors before they can qualify for Army commissions. It was pointed out that these officers have at least nine years of training beyond the high school level while most other Army officers have less formal education at the time they are commissioned. With the majority of Army medical officers now serving temporary two-year periods as a result of the Doctor-Draft Act, accelerated promotions are another means of attracting career officers into the Army.

ATOMIC ENERGY COMMISSION

Research Center to Be Built at Brookhaven National Laboratory.—Lewis Strauss, chairman of the U. S. Atomic Energy Commission, announces that a medical research center, including a nuclear reactor designed specifically for medical research and treatment, will be constructed at Brookhaven National Laboratory, Upton, N. Y., at a cost of 6 million dollars exclusive of design and engineering. The new facility will house a nuclear reactor, a research hospital, an industrial medicine branch, and research divisions in medical physics, pathology, microbiology, biochemistry, physiology, and clinical chemistry.

The present medical facility at Brookhaven consists of some 20 temporary buildings which were part of Camp Upton Hospital when the site was used by the Army during World War II. The buildings have become more inadequate as well as more difficult and costly to staff and maintain. The medical reactor at Brookhaven will be one of the first two in the United States. In July, the commission announced that the University of California had filed license applications with the commission for construction and operation of a medical reactor on the campus of the University of California at Los Angeles.

Medical research and treatment with neutrons have been conducted at Brookhaven since 1951 by using the general purpose research reactor already in operation. Treatment of patients at this reactor, however, requires that other work cease during the medical run, interrupting the research programs of other laboratory departments. The new reactor, designed specifically for medical use, will make available a source of neutrons for experimental work on brain cancer, as well as a number of special short-lived radioisotopes, permitting a much wider range of medical investigation than now under way.

NAVY

Officers Commended for Mexico Flood Disaster Duty.—The Commander, Joint U. S. Military Disaster Relief Forces, in Yucatan Peninsula and Tampico, Mexico, Rear Admiral M. E. Miles, has forwarded letters of commendation to Commander Jerry J. Zarriello, M. C., and Lieut. Commander Thomas B. Murray, M. S. C., USNR, for outstanding performance of duty while attached to his staff.

Commander Zarriello, flight surgeon, was commended for outstanding professional ability, initiative, judgment and devotion to duty as an advisor and in providing medical assistance and preventive measures in those disaster areas; he was also commended for his great endurance and outstanding professional skill in applying emergency surgical and medical measures to aid about 150 injured persons, under adverse field conditions, in the isolated village of Xcalac, State of Quintana Roo, Mexico, which village had been entirely destroyed by a severe hurricane. Commander Zarriello worked without rest or professional assistance for about 24 hours in carrying out this stage of his valuable disaster relief work.

Lieutenant Commander Murray, assigned additional duty on the staff of the commander of the task group for the purpose of rendering emergency epidemic disease control measures in the flooded city of Tampico and its outlying area, was commended for outstanding professional ability, judgment, and devotion to duty in executing these preventive measures in the disaster area.

Commander Zarriello is attached to the fleet aircraft service squadron 105, U. S. Naval Station, Coco Solo, Canal Zone. Lieutenant Commander Murray is attached to the naval air station, Corpus Christi, Texas.

Personal.—Lieut. Commander Thomas R. Ulshafer and Lieut. (j. g.) Frederick J. Fuerbach were recently commissioned in the regular Medical Corps of the Navy.

VETERANS ADMINISTRATION

Work Adjustment Training.—The Veterans Administration announces that hundreds of severely disabled veterans who might still be on the sidelines have gained a new start toward independent living through its program of "work adjustment training." The program is designed to help each disabled veteran master the fundamentals of day-to-day living and working. It is not designed to train him thoroughly for a specific job; that can come later, VA said. Most work adjustment training has been provided for disabled veterans in sheltered workshops and rehabilitation centers, where they can receive the sympathetic and understanding attention necessary in their first steps of adjustment to the work-a-day world. A few vocational schools also offer this training.

The program helps the veteran acquire fundamental work capacities—such as training a double-arm amputee to manipulate his hooks in handling papers for a filing job. It helps him adjust to work activities, to feel that, despite his handicaps, he is a part of his place of work, rather than apart from it, and it helps him develop fitness for a regular program of vocational training that can follow. Through "work adjustment training," severely disabled veterans already have prepared for jobs as draftsmen, office workers, restaurant workers, leatherworkers, woodworkers, radio repairmen, printers, book-binders and many more.

PUBLIC HEALTH SERVICE

Daily Water Supplies.—More than 52 million people in communities of 25,000 and over now depend on surface sources for their daily water supplies, as compared with fewer than 40 million eight years ago, the Public Health Service said in announcing results of a nationwide inventory; however, the use of untreated water by the country's larger communities has virtually ended. Less than one per cent of the population in communities of 25,000 and over today use untreated water, the service said.

These developments provide some measure of the progress made by our cities and towns in meeting the water needs of their rapidly growing populations, Gordon McCallum, chief of the service's water supply and water pollution control program, said. The sharp increase in the number of people dependent on surface waters also points up the need for conserving our natural water supplies through water pollution control and other practicable measures.

DEATHS

Abt, Isaac Arthur ⊕ in 1948 recipient of the Distinguished Service Medal of the American Medical Association, died at his home in Chicago Nov. 22, aged 87, of heart disease. Dr. Abt was born in Wilmington, Ill., Dec. 18, 1867. After a preliminary medical course at Johns Hopkins University in Baltimore in 1889, he received his degree of doctor of medicine in 1891 from the Chicago Medical College, now known as Northwestern University Medical School. He was thereafter an intern in Michael Reese Hospital from 1891 to 1892 and subsequently did graduate work in Vienna and Berlin. From 1897 to 1901 he served as professor of diseases of children in Northwestern University Woman's Medical School and was associate professor of diseases of children in Rush Medical College from 1902 to 1908. He then became professor of pediatrics and chairman of the department from 1909 to 1939, since which time he was professor emeritus. A specialist certified by the American Board of Pediatrics in 1926, Dr. Abt held the presidency of the American Pediatric Society and in 1930 that of the American Academy of Pediatrics, of which he was a founder. He was a past-president of the Chicago Medical Society, Institute of Medicine of Chicago, Chicago Pediatric Society, and the American Association of Teachers of Diseases of Children, a member of the Central States Pediatric Society, and honorary member of the German Society of Pediatrics and the Minnesota chapter of Alpha Omega Alpha, honorary medical fraternity. In 1927 he was made a Chevalier of the Legion of Honor of France. In 1909 he helped to found the first Chicago Milk Commission, which later developed into the Infant Welfare Society. He also served for a time as district county physician and as inspector of the staff of the Chicago Health Department. From 1919 through 1935 Dr. Abt was a member of the House of Delegates of the American Medical Association and in 1911-1912 was chairman of the Section on Diseases of Children. In 1925 he presented to the House of Delegates a report on the methods of sale and promotion of proprietary infant foods that has served as a standard since that time. He planned and built the first children's hospital in Chicago (Sarah Morris, a part of Michael Reese), where he was a consultant. He was a consulting physician in diseases of children at the Children's Memorial Hospital and St. Luke's Hospital, and attending physician, diseases of children, at the Passavant Hospital. He was credited with being the first physician to administer diphtheria antitoxin in Chicago, the first to provide incubators for premature babies, and the first American pediatrician to use protein milk in the treatment of diarrhea in infants. Dr. Abt was not only an outstanding clinician but was also a great teacher. His contributions to the literature of his specialty include hundreds of articles, a book called "The Baby's Food," published in 1917, and an autobiography called "The Baby Doctor," published in 1944. His "System of Pediatrics" was an encyclopedic work. He was helpful in 1910 in founding the *American Journal of Diseases of Children* and was editor of the volume on pediatrics in the Practical Medicine series. The Isaac A. Abt Pediatric Foundation at Northwestern, to which funds have been contributed by the physician's friends in his honor, furthers pediatrics research in the medical school and finances a fellowship in the field of children's diseases. In 1931 he received an honorary degree of doctor of science from Northwestern.

Eaton, William Edward ⊕ Captain, U. S. Navy, retired, Washington, D. C.; born in Newburyport, Mass., Nov. 7, 1882; Harvard Medical School, Boston, 1904; joined the U. S. Navy on March 14, 1910, as acting assistant surgeon; his first duty assignment was at the Naval Hospital, Chelsea, Mass.; during his 40 years of active service in the Medical Corps of the Navy, he landed at Vera Cruz, Mexico, with a force from the USS Utah, in 1914, in operations against Mexican forces; in 1914, served as an instructor at the Naval Medical School; in 1919 while serving as the sanitary engineer in the Republic of Haiti, set up and organized the public health service for that Republic; in June, 1935, assumed duty as executive officer of the Naval Hospital, Newport, R. I., after which he attended the senior class at the Naval War College in 1937; served as the Force Medical Officer, Destroyers Battle Force; in 1939 was ordered as medical officer in command of the Naval Hospital, Great Lakes, Ill., for which service he was awarded the Legion of Merit; was also a recipient of the Marine Corps medal, the Mexican medal, and the Haitian medal; placed on the retired list on Oct. 1, 1943, and continued on active duty; in 1946 served as a member of the Navy Regulations Board, convened to revise and rewrite Navy regulations; served as member of a board in the Bureau of Medicine and Surgery to prepare regulations implementing the Medical Service Corps, nurse corps, and the dental corps laws; in July, 1948, undertook preparation of medical department correspondence courses for the Naval Reserves; placed on inactive duty on Feb. 28, 1950; fellow of the American College of Surgeons; served on the staff of the Council on Medical Education and Hospitals, American Medical Association; died in the U. S. Naval Hospital, Bethesda, Md., Oct. 19, aged 72.

Curtis, Arthur Hale ⊕ Chicago; born in Portage, Wis., May 20, 1881; Rush Medical College, Chicago, 1905; interned at the Cook County Hospital; later took post-graduate work abroad; professor of obstetrics and gynecology emeritus at Northwestern University Medical School, where he was professor and chairman of the department of obstetrics and gynecology for many years; specialist certified by the American Board of Obstetrics and Gynecology; member of the House of Delegates of the American Medical Association in 1932, 1933, and 1934 and chairman, Section on Obstetrics, Gynecology and Abdominal Surgery, 1926-1927; member of the American Gynecological Society, of which he was at one time secretary and president; past-president of the Chicago Gynecological Society; member of the Nu Sigma Nu, Chicago Pathological Society, and the Central Association of Obstetricians and Gynecologists; fellow of the American College of Surgeons; served overseas during World War I; for many years chief of service, obstetrics and gynecology, at the Passavant Memorial Hospital; at one time head football coach at the University of Kansas in Lawrence and the University of Wisconsin in Madison, where in 1935 he was awarded the honorary degree of doctor of laws; author of "Textbook of Gynecology" and "Gynecological Diagnosis"; editor of "Obstetrics and Gynecology"; died at his home in Evanston, Ill., Nov. 13, aged 74, of myocardial infarct.

Beall, Walter C., Denver; Medical College of Indiana, Indianapolis, 1901; an associate member of the American Medical Association; died in St. Luke's Hospital Sept. 14, aged 82, of pernicious anemia and arteriosclerosis.

Beeler, Thomas Taylor Jr. ⊕ Manchester, N. H.; University of Oklahoma School of Medicine, Oklahoma City, 1937; specialist certified by the American Board of Surgery; fellow of the American College of Surgeons; lieutenant colonel, Medical Corps, U. S. Army, from 1940 to 1953 and was awarded the Bronze Star medal with Oak Leaf Cluster; on the staff of the Veterans Administration Hospital; died Oct. 29, aged 44.

Belt, Leroy Lorin, Spring Valley, Calif.; Western Reserve University School of Medicine, Cleveland, 1916; served during World War I; on the staff of the La Mesa (Calif.) Community Hospital and Paradise Valley Sanitarium and Hospital in National City; died Sept. 23, aged 63, of coronary thrombosis.

Blanchar, William Otis, Los Angeles; Chicago Homeopathic Medical College, 1903; College of Physicians and Surgeons, Los Angeles, 1913; served in the regular Army; died Nov. 6, aged 81, of arteriosclerosis.

Boehmer, Arthur Clarence ⊕ Lodi, Calif.; University of Illinois College of Medicine, Chicago, 1914; member of the Industrial Medical Association; for many years director and president of the San Joaquin local health district; for 25 years physician for

---

⊕ Indicates Member of the American Medical Association.

the Lodi Union High School football team; member of the board of directors of the Lodi Memorial Hospital; died in Truckee Oct. 7, aged 64, of cerebral vascular accident and diabetes mellitus.

Bostick, Alonzo E. ⊕ Iuka, Miss.; Memphis (Tenn.) Hospital Medical College, 1907; died Oct. 16, aged 84, of coronary occlusion.

Brabham, Vance Wells ⊕ Orangeburg, S. C.; University of Maryland School of Medicine, Baltimore, 1905; died Aug. 28, aged 74, of portal cirrhosis.

Brewer, John F. ⊕ North Little Rock, Ark.; Memphis (Tenn.) Hospital Medical College, 1901; local surgeon for the Rock Island Railroad; died in St. Vincent's Infirmary, Little Rock, Oct. 19, aged 80, of cerebral hemorrhage.

Brooks, Osceola Judkins ⊕ Huntsville, Ala.; Medical Department of Tulane University of Louisiana, New Orleans, 1893; past-president of the Madison County Medical Society; on the staff of the Huntsville Hospital, where he died Oct. 3, aged 83, of coronary thrombosis.

Browning, Arthur Wolfe ⊕ Elloree, S. C.; Baltimore Medical College, 1897; member of the American Academy of General Practice; died in the Orangeburg (S. C.) Regional Hospital Sept. 28, aged 77, of cerebral thrombosis.

Buchanan, William Paul ⊕ Detroit; University of Toronto Faculty of Medicine, Toronto, Canada, 1924; member of the American Academy of General Practice; on the staff of the Florence Crittenton Hospital and Mount Carmel Hospital; died Oct. 16, aged 57, of cancer.

Charters, John Henry ⊕ Fenton, Mich.; Detroit College of Medicine, 1897; died Oct. 5, aged 85.

Cobb, Donnell Borden ⊕ Goldsboro, N. C.; University of Pennsylvania School of Medicine, Philadelphia, 1921; member of the founders group of the American Board of Surgery; past-president of the Medical Society of the State of North Carolina; vice-president of the Southern Surgical Association; fellow of the American College of Surgeons; on the staff of the Goldsboro Hospital; died Nov. 12, aged 57, of coronary thrombosis.

CANADA

Disability Allowances.—In 1954 the Parliament of Canada authorized financial assistance for permanently and totally disabled persons incapable of rehabilitation. The costs of assistance were to be shared equally by the federal and provincial governments and up to $40 a month was to be provided for each eligible person. All 10 Canadian provinces have now started their programs to implement this legislation. Criteria for permanent and total disability are severe, and emphasis is laid on rehabilitation where there is any hope of restoring function. The mechanism for assessing candidates for financial assistance from the medical standpoint is as follows: Applicants are first seen by their regular physician, who fills in a comprehensive medical form that is designed to give a clear picture of the functional loss due to mental or physical disability and, when completed, is passed on to a medical review board composed of a physician and a social worker representing the provincial government and a physician representing the federal government. The board may call for specialist help if needed, but it does not usually see or examine the patient, hence the need for a complete clinical report by the patient's physician. It may recommend acceptance, rejection, deferment, or reference to the rehabilitation services in the province. In the last case, the board does not actually prescribe rehabilitation but leaves assessment to rehabilitation assessment teams located in hospitals and rehabilitation centers.

It is inevitable that a scheme of this sort should have teething troubles. One complaint made by the medical profession has been of inadequate preliminary screening in some provinces. In some areas applicants who are obviously unsuitable have been reaching the physicians' offices, there to be turned away with some hard feelings. In other areas, however, screening has been good, and over 70% of applicants are reported to have been accepted. The second grievance has been the length of the form to be filled in. Whereas some provinces are prepared to pay the physician for his time and trouble, others have apparently expected to get this service free. To smooth out the workings of this program, a committee has been set up by the Canadian Medical Association. This committee is in close contact with the federal medical officer responsible for the program, and it is probable that, when the work is reviewed at the end of the first year, its unsatisfactory features can be dealt with. Perhaps the most encouraging feature of the program is the emphasis on rehabilitation. Nobody is to be written off as a total economic loss to the community unless the possibilities for restoration of function have been exhausted.

Good Patient Care.—As a timely reminder of the primary purpose of a hospital, the theme of the recent annual convention of the Ontario Hospital Association was "Good Patient Care Our Constant Aim." Two persons at this convention made the headlines, sharply criticizing certain aspects of the hospital system. The first blast came from the mayor of the city of Hamilton, who had been asked to speak from the patient's point of view in a panel discussion entitled "Let's Have a Look at Patient Care." Although Mayor Jackson has never been a hospital patient, some of his remarks were not without foundation. He said that hospital beds are cluttered up with persons who should not be there but in the care of their relatives or in other types of institutions. This is not a reflection on the hospital as much as on filial piety. He also complained that little was done to allay the apprehension of patients entering the hospital, to make them feel at home, or to explain to them hospital routine and the object of the diagnostic tests they were undergoing. He deplored the continued building of hospitals in noisy areas on busy streets. Hospitals should be at least 200 yards back from the road. He also suggested that interesting paintings on walls and ceilings of wards might give bored and helpless patients something to stare at.

The second critical paper, entitled "Psychiatric Problems in Hospitals," was read by Dr. D. G. McKerracher, president of the Canadian Psychiatric Association, whose chief target was the mental hospital. While praising the efforts of some devoted staff members, he said that the mental hospitals had made little progress in the last century beyond changing their name from asylum to hospital. Constantly and intolerably overcrowded, and usually located in remote areas far from medical centers, they were often hospitals only in name. The speaker blamed public attitudes for much of the trouble. The public still believes that mental illness is shameful or disgraceful and regards discharge from a mental hospital as a rare event. He advocated the treatment of mental illness in wards of general hospitals as far as possible, with mental hospitals for the more difficult chronic cases. The mental hospitals should be close to general hospitals, perhaps even as a 300-bed wing of the latter, with emphasis constantly on successful therapy and with the support of an accepting and interested community. As regards patients in general hospitals, it is essential to indoctrinate the staff with the idea that all illness has associated emotional problems, which need understanding and help by hospital personnel.

Adenoidal-Pharyngeal-Conjunctival Virus.—Members of the adenoidal-pharyngeal-conjunctival (APC) group of viruses, recognized in the United States, have recently made their appearance in Canada. A group of workers in the University of Toronto, engaged in research on viral diseases of the eye, have identified type 3 APC virus in eye washings obtained from seven patients involved in last winter's epidemic of follicular conjunctivitis and keratitis. The strain of virus was isolated and the disease was reproduced in a human volunteer by inoculation of tissue-culture fluid into the conjunctival sac. In a further communication (*Canad. M. A. J.* 73:864, 1955) the same group reports an epidemic of pharyngeal-conjunctival fever in Ontario in August, with fever, preauricular adenopathy, pharyngitis, follicular conjunctivitis, and corneal opacities in children and adults who had used swimming pools over a widely scattered area. Children were less severely affected than adults, few having corneal opacities, but catarrhal otitis media was a complication in 42 of 104 cases in children. Viral studies in progress suggest that the epidemic is also due to type 3 APC virus, and epidemiological studies show that, as in the 1954 epidemic in Washington, D. C., transmission has been either through contact at the swimming pool or by contact within the family.

Antibiotic-Resistant Organisms in Cheese.—When Micrococcus and Streptococcus organisms resistant to antibiotics are encountered in a patient previously treated with these drugs, or with a history of hospitalization, the cause of the situation is clear, but there is an increasing number of patients infected with antibiotic-resistant organisms from whom no such history is obtainable. Thatcher and Simon (*Canad. J. Pub. Health* 46:407, 1955) suggest that the resistant organisms may in some cases have been conveyed to the household in cheese. They purchased 100 specimens of cheese from retail stores in Canada, isolated Micrococcus and Streptococcus organisms from these, and determined the resistance of the organisms to antibiotics. They found that the commonest resistances were to penicillin and dihydrostreptomycin, the two antibiotics most commonly administered to cattle for control of bovine mastitis. No less than 15% of micrococcic and 67% of streptococcic cultures were resistant to penicillin. Food contaminated with such organisms may well be contributing to the severity of the problem of human infections with resistant strains of Micrococcus and Streptococcus organisms.

The items in these letters are contributed by regular correspondents in the various foreign countries.

DENMARK

Reorganization of Hospital Services.—In 1953 the Danish public health service and the Danish Medical Association appointed a committee to investigate the future optimal size of hospital departments, with special reference to the medical and surgical departments, and the most suitable organization of hospital medical staffs. Their report (*Ugeskrift for læger*, Aug. 23) states that between 1930 and 1954 the number of hospital departments for diseases of the ear, nose, and throat has risen in the provinces from 1 to 19 and for diseases of the eye from 0 to 14. The number of hospital beds for surgical cases has been doubled in the same period. The expansion of certain hospital departments has been so great and work in them so intensified that their chiefs have had great difficulties in giving personal attention to each patient, to their subordinate staff, and to research, current medical literature, and medical meetings. Another obstacle to maintaining close contact with each patient is the comparatively rapid turnover of patients in the hospital. It is suggested that a purely surgical hospital with only one chief, unaided by a highly qualified second-in-command chief, should not have over 80 beds and that the number of beds should not exceed 60 in hospitals specializing in neurosurgery or thoracic surgery. The objection that so small a hospital would not have a great enough variety of cases for teaching purposes can be met by an increase in turnover. On the organization of hospital medical staffs, the report says that with so few senior appointments and so many junior or subordinate appointments the prospects of promotion are relatively poor. The obvious remedy for this state of affairs is to create more senior appointments. It is also suggested that scientific, clinical research be encouraged in the provincial hospitals, and it is noted as a promising sign of the times that, of late, about one-third of the scientific papers submitted to the journal by the Danish Medical Association were of provincial origin. Another recommendation was that an adequate supply of secretarial aid be provided to relieve the medical hospital staff as much as possible of the task of filling in forms.

Prostatovesiculitis.—Abrahamsen and Madsen in *Ugeskrift for læger* for Aug. 4, reported on a series of 140 patients with prostatovesiculitis. They have learned to challenge the validity of three teachings hitherto regarded as axiomatic: that this disease is comparatively rare, that it is due to gonorrhea in most cases, and that its treatment requires the skill of a specialist. The alleged rarity of the disease may in part reflect lack of interest in it, and it is possible that the rise in the number of cases reported from the authors' hospital (from 15 in 1949 to 41 in 1954) may have come about because some cases were formerly overlooked. As for the part played by gonorrhea, smears and cultures of the urethral discharges of 129 patients yielded gonococcus organisms in only 4. In the entire series, however, 42 gave a history of gonorrhea. It is therefore conceivable that about a third of these patients had developed their prostatovesiculitis as a sequel to inadequate treatment of their gonorrhea, but this is only a speculative conclusion. While syphilis was rare in this series (5 patients), 22 patients had urographic and cystographic evidence of calculi in the prostate or upper urinary tract. There were also 16 patients with a history of stricture of the urethra. Habitual constipation was complained of by 31 patients, and an influenza-like attack occurred just before the prostatovesiculitis developed in 35 cases. A preliminary examination in some urologic hospital was recommended, but, once the correct diagnosis is made and the necessary instructions for treatment have been given, the general practitioner is quite capable of giving the prostatic massages found to afford some relief. Successful treatment requires persistence on the part of both physician and patient, and relapses are common. Of 24 patients reexamined three to five years after treatment was started, 9 were no better, 11 were improved, and only 4 were symptom-free. Chemotherapy and antibiotics are recommended only after effective drainage has been established, and even then with discrimination.

Prognosis in Cerebral Apoplexy.—Dr. Erik Skinhöy (*Nordisk medicin*, Aug. 25) has examined the records of 1,000 patients with cerebral apoplexy. The sex of the patient did not influence the case fatality rate (about 44%), but the patient's age did: under the age of 50 years it was 43% and over 80 years it was 58%. Comparatively young patients showed, however, a high case fatality rate, presumably because their apoplexy was often complicated by chronic nephritis and hypertension. Whether the patient had had a previous attack of apoplexy did not affect the rate. The prognosis was comparatively good when the patient's temperature was normal (case fatality rate 38%), whereas it was not good when the temperature was subnormal (case fatality rate 78%) and it was poor in the presence of fever (case fatality rate in a series of 125 patients 100%). Bad prognostic signs were Cheyne-Stokes respiration and cyanosis indicative of a failing heart. Underweight patients fared slightly worse than overweight patients (case fatality rate 45 and 42% respectively). The 318 patients with loss of consciousness showed a case fatality rate of 74%. Involvement of the lower limbs impaired the prognosis, probably because in most patients it was associated with damage at a higher level also. Among the patients rallying during the first 24 hours of an attack, the case fatality rate was under 20%.

ENGLAND

Injection of Drugs into Brain.—Dr. S. Sherwood has examined the response of psychotic patients to drugs injected into the ventricles of the brain (*Proc. Roy. Soc. Med.* 48:853, 1955). Injections were given at first with sharp needles through the scalp and previously made frontal bur holes. Later they were given with fine hypodermic needles through the scalp and the rubber bung of a cannula screwed into the frontal bone. The dose of drug, which was dissolved in Tyrode's solution, was calculated as the proportion of the systemic dose that would be contained in the ventricular fluid if the distribution after systemic injection were even throughout the body. All patients were chronic psychotics who had been ill for 3 to 25 (average, 11) years. The effects of the injections were observed in some patients over a period of two years. The observations were controlled with Tyrode's solution and followed up with extensive electroencephalographic recordings. Epinephrine in doses of 5 to 250 mcg. produced a general relaxation and lowering of muscular tone, a transient flush, warming of the extremities, sweating, and drowsiness. If no alpha rhythm were present in the control electroencephalogram after the injection of epinephrine, it appeared within a few minutes, and, if it were originally present in the control, it became enhanced. The electroencephalographic record was similar to that occurring in typical light sleep. Atropine in doses of 250 to 500 mcg. produced an increase in spontaneous movements of a relaxed kind. Methantheline and Pro-Banthine, in addition to an atropine-like effect, produced increased activity, and even agitation, and a change in the number of alpha frequencies of the electroencephalogram. Cholinesterase produced flushing and improvement in the condition of catatonic patients, who calmed down, became cooperative, and spoke rationally. The alpha rhythm in the electroencephalogram was greatly enhanced. Pentamethonium and gallamine, which are muscle relaxants, had a similar action. After the administration of serotonin (5-hydroxytryptamine), the patients became pale and perspired, were active or restless, talked readily, and, after several weeks, showed clinical improvement. They became employable and interested, improved their personal habits and appearance, and spoke more rationally. The electroencephalogram showed an increase in alpha amplitude, but not frequency, and a stabilization of the frequency with clinical improvement. Complications included infection of the spinal fluid and epileptic seizures due to puncture of the choroid plexus or a branch of the anterior cerebral artery. Cholinesterase had the most marked effect on abnormal thought processes and hallucinations; methantheline increased activity; the effect of serotonin stands between that of these two agents. Acetylcholine caused exacerbation of the patient's condition.

When Is a Drug Not a Drug?—Regulations 16 and 17 of the National Health Service Regulations, 1948, provide that if a physician prescribes under the National Health Service preparations that are not drugs or medicines and therefore outside the scope of the act, the executive council may recover their cost from him. If he challenges their action, the matter may be referred to the local medical committee, with the possibility of appeal to referees. In 1950 decisions were made on whether various borderline preparations should be classified as foods, toilet preparations, or drugs. A committee was appointed to classify substances as foods or drugs, and the report was published. Further reports were made on the classification of toilet preparations and antiseptics and circulated to physicians. The committee recommended that disinfectants should be regarded as drugs only when they are ordered in such quantities and with such directions as are appropriate for the treatment of an individual patient. Disinfectants are not considered as drugs if they are to be used for general hygienic purposes; thus saponated cresol solution may be prescribed for dressing a wound but not to disinfect the bath. Three test cases have come before the referees. A physician prescribed sulfur soap for seborrheic dermatitis. The executive council disallowed this as a free prescription item, and the physician appealed to the local medical committee, which upheld the decision. The physician then appealed to the referees. His argument was that a London dermatologist had prescribed sulfur soap for the patient. The referees decided that sulfur was a drug but soap was not and that therefore sulfur soap was not a drug. Another physician prescribed an antiseptic for an irritating skin lesion; it was the only preparation that relieved the patient. Curiously, though this therapy was almost certainly of a psychological nature, the referees allowed the claim. The case for sulfur soap as a therapeutic agent was much stronger, but the claim failed. Another physician prescribed a protein hydrolysate for a patient suffering from ulcerative colitis, with profuse diarrhea and malnutrition. This was disallowed by the executive council and by the referees. The physician's claim was upheld by a specialist who had seen the patient, but the referees held that it was not for specialists to advise on what executive councils could or could not provide under the National Health Service Act. These bureaucratic anomalies are frustrating for conscientious physicians trying to do the best for their patients. The thought that must be uppermost in their minds is not the value of the preparation to the patient but the opinion of the executive council on its validity as a free prescription item.

Nephrosis Treated by Malaria.—Gairdner and Shute have reported on patients with nephrosis in whom remissions have been induced by infecting the patient with malaria of the benign tertian variety by means of mosquito bites (*Lancet* **2**:946, 1955). A total of 65 patients was treated, 51 with "pure nephrosis" and 14 with nephritic nephrosis. The malarial attack was cut short with Proguanil. If a diuresis began any time after the onset of the malarial pyrexia, and up to a week after the end of the pyrexia, it was ascribed to the malaria. A complete remission was defined as loss of all edema, sustained for at least three months, and a partial remission as one where the loss of edema, although substantial, was either incomplete or was not sustained for three months. Complete remission was obtained in 14 of the patients with pure nephrosis, and 12 of these remained well within follow-up periods of up to six years. Partial remission occurred in 11 of the patients with pure nephrosis and in 5 of the nephritic nephrosis patients. The remaining 35 patients showed no remission. Most of the patients tolerated the treatment fairly well, although malaria was thought to have contributed to the death of one patient. Anemia developed in a large proportion of the patients with pure nephrosis. The plasma cholesterol level fell to normal levels within two weeks, and the gamma globulin, typically depressed in nephrosis, rose to normal levels. Proteinuria usually diminished sharply as diuresis set in. When remissions induced by malaria were compared with those induced by other means, the clinical and chemical abnormalities were essentially the same. In the malaria-induced remissions, however, the cholesterol level fell steadily from the onset of the pyrexia. The authors concluded that, while the cause of nephrosis remains obscure and treatment is empirical, malaria therapy is of value.

Effects of Employment of Pregnant Women.—For women having their first babies, gainful employment, in the first half of pregnancy if not throughout, is common. The state encourages married women to work by giving them preferential tax relief. Many married women of all ages with children work in factories. Dr. Alice Stewart has investigated the effect of employment of the mother on the health of the baby (*Brit. J. Prev. & Social Med.* **9**:159, 1955). She examined the records of 1,318 single first births and correlated these with the occupation and social position of the mother. The perinatal mortality and incidence of prematurity were greater in the infants of mothers who worked during pregnancy than in those of mothers who were housewives. The perinatal death rate increased with the time spent working in pregnancy. In infants born of housewives it was 2.8%. This rose to 4.9% if the mothers were employed for less than 28 weeks of the pregnancy and to 7.5% if they worked for more than 28 weeks. The incidence of prematurity in the same groups was 4.7%, 8.4%, and 11.1% respectively. There was no significant difference in the incidence of toxemia of pregnancy and the frequency of instrumental delivery in the three groups. The perinatal death rate and the incidence of prematurity were more than three times as high in the infants of mothers who were the wives of semiskilled and unskilled manual workers as in the infants of mothers married to professional men and business executives. The perinatal death rate and incidence of prematurity were both greater in the infants born of unmarried mothers. Examination of the causes of death suggested that the reason employed pregnant women had less successful pregnancies than housewives was that more of them gave birth to small babies whose survival rate was low.

Unemployment Among Physicians.—Dr. L. S. Potter of the Medical Practices Advisory Bureau, British Medical Association, has conducted an inquiry to ascertain the degree of unemployment and the number of "blind-alley" occupations in the British medical profession. This followed questions in Parliament on the unemployment of physicians and the statement that there were alleged to be 200 applicants for each vacant post in the United Kingdom. The Minister of Health was also asked whether, in view of the growing numbers of unemployed among British physicians, he would consider their being engaged in the Colonial Medical Service. Questionnaires were sent to 1,075 physicians, all of them registered with the bureau as seeking professional work in England. They were thus a group seeking positions or practices to better their prospects and not a cross section of the profession. Analysis of the questionnaires returned showed that 8% were unemployed. Of those in a representative group eligible for and seeking to establish themselves in general practice, not less than 5%, and not more than 7%, were unemployed and 45% stated that they were employed. Another 23% did not reply, and probably most in this group did not do so because they were suitably employed. Blind-alley or dead-end jobs were held by 25%. The figures for this group were difficult to interpret because one physician might be more ambitious than another and therefore not be satisfied with his position. Thus a practitioner who had been in one or more assistantships for several years and had been applying for openings with principal status without success might be said to be in a dead-end position.

Broken Hypodermic Needle.—A 15-year-old girl went to a hospital for an intramuscular injection of penicillin, which a nurse gave through a no. 16 needle. During the injection the girl made a sudden movement and the needle broke. An operation to remove it was performed with no remaining disability, except for a 3½ in. scar on the thigh. The girl, through her father, sued the hospital and the nurse for negligence. The judge said that there was nothing wrong with the nurse's method, but it was claimed that she used too short a needle and had pushed it in too far. The plaintiff's expert witness said that it was wrong to use a no. 16 needle and that he would have used a no. 2 needle, which is longer, thicker, and stronger. The defendant's expert witness considered that the selection of the needle and the method used were both right. The judge said that it was purely conjectural that the needle was pushed in right up to the hilt before it broke. It broke suddenly, and if a longer and thicker one had been used it would have caused more pain to the patient. He was not satisfied with the evidence that the needle was pushed in too far. All that was asked of nurses was that they should use reasonable care. The accident could have been due to an unexpected movement by the girl. As this could not be reasonably foreseen, it would not be right to use a thicker and longer needle and inflict extra pain on all patients to meet the possible contingency that one of them might flinch in the way this girl did. The judge said that no negligence was proved and gave judgment for the defendants.

Budget and the Health Service.—An autumn budget was introduced by the Chancellor of the Exchequer to curb spending and so help reduce imports, which are exceeding exports. The purchase tax has been increased to 30%, and this is levied not only on goods generally but also on certain medicines supplied to both private and National Health Service patients. Every new proprietary drug carries a purchase tax. The sums collected through this tax on drugs prescribed for National Health Service patients are about $700,000 and will probably be increased to nearly a million dollars per annum with the rise in tax rate. The Chancellor in his report to Parliament urged public authorities to cooperate in restraining both current and capital expenditure, and the hospitals were asked to economize. No actual restraint, however, was placed on them, and the government will not reduce hospital programs already announced. Hospital boards have been asked to undertake only those works that are urgent and necessary. The hospital building programs for 1956-1958 will not be affected. The cost of equipping new hospitals or new hospital departments will be higher because of the increased purchase tax. This will not result in any absolute increase of government spending but in the transfer of money from one government pocket to another.

Death from Penicillin.—At an inquest on the death of a 9-year-old boy, it was revealed that he had received an overdose of penicillin given intrathecally. On admission to the hospital he complained of headache, vomiting, and photophobia and was unable to move his head. A lumbar puncture was performed and penicillin given intrathecally. A trainee nurse was ordered to prepare an injection of 100,000 units, but she prepared 500,000 units by mistake and the dose was not checked by the physician giving the injection. Within 20 minutes the child had a convulsion and about four hours later died. The pathologist said that the cause of death was asphyxia due to convulsions, which were due to the penicillin. The spinal fluid was normal, and there was nothing to indicate the cause of the child's original illness. The coroner returned a verdict of death from misadventure. The jury considered that a fully qualified nurse should always be available for preparing intrathecal injections.

Cortisone Freed.—Now that at least three British firms are making cortisone in substantial quantities general practitioners are free to prescribe it for patients covered by the National Health Service and for private patients. Supplies of cortisone have so far been restricted to hospitals because the greater part has had to be imported. It is being made in Britain from sisal waste, a by-product of the rope industry.

INDIA

Endothelial Myeloma.—Agarwal and Ahuja (*Indian J. M. Res.* 43:521, 1955) reported a case of tumor of the lower jaw observed in a 3-year-old girl during routine histopathological examination at the Central Research Institute, Kasauli. The tumor showed features characteristic of endothelial myeloma (Ewing's sarcoma). The usual sites for this type of tumor are shafts of long bones, ribs, and flat bones of the pelvis. Its occurrence in the mandible is rare, only 19 cases having been previously reported. These cases occurred either in children or in young adults. The growth in this patient was noticed only a month before operation was performed. It had grown rapidly and was excised along with a portion of the jaw. On examination the growth could not be distinguished from the bone. Cortex and medulla were homogeneous, white, and firm. There was diffuse growth of closely packed round cells with oval, vesicular nuclei and poorly-staining scanty cytoplasm. The cells tended to form alveoli separated by fibrous trabeculae. Only certain areas showed polyhedral cells. The appearance somewhat resembled that of a lymphosarcoma. There was absence of cellular pleomorphism and osteogenic elements in the tumor.

Manufacture of Drugs.—The government has accepted the recommendations of the Pharmaceutical Enquiry Committee for the expansion of the pharmaceutical industry in India. In accordance with the recommendations the government plans to centralize the administration of the Drugs Act and exercise quantitative control of production. A development council for drugs has been set up to advise on matters relating to this industry. This committee is now drawing up the second five-year plan. It was also recommended that the duty on raw materials should be adjusted. Slaughterhouses along modern lines equipped to collect and store the glands and organs required by the pharmaceutical industry should be provided in all cities and large towns. The pharmaceutical industry is asked to set up testing laboratories for certifying the products and assisting the government in preventing the sale of substandard and spurious drugs. India hopes thus to become self-sufficient in drugs and chemicals and may even be in a position later to export some drugs and chemicals to other countries.

Production of Penicillin.—The government will produce all types of penicillin at the state-owned penicillin factory at Pimpri. A committee appointed to study the production of penicillin recommended that the capacity of the factory be increased by 60%. The glass vials used for packing will be siliconized at the penicillin bottling plant in Bombay. This will enable the last drop of penicillin to be withdrawn, thus saving 10 to 15% of the penicillin. The committee favors the production of potassium and sodium penicillin, procaine penicillin, benzathine penicillin, and benzathine penicillin G. Although there is no difference between the potassium and sodium salts therapeutically, the former is less hygroscopic and cheaper to manufacture. Procaine penicillin will be dispensed (1) fortified with the potassium or sodium salt in the proportion of 300,000 units of the first and 100,000 units of the second and (2) in oil with 2% aluminum monostearate. Penicillin for oral administration will be made in the form of tablets of 200,000 units each.

Urban Health Unit.—India's first urban health unit was opened in Calcutta in November. There are at present rural health units, and they have proved to be very effective. The urban health unit was sponsored jointly by the government of India, the United Nations International Childrens Emergency Fund, the World Health Organization, the government of West Bengal, and the Corporation of Calcutta. About 68,000 persons, or 13,000 families, will benefit from the scheme. Industrial workers, expectant mothers, children, and sufferers from veneral diseases, tuberculosis, and leprosy will receive special care. An intense health education program will be undertaken. A modern maternity home with 30 beds and a well-equipped nursery will be established close to the health unit. The unit will also serve as a demonstration center and practice field to students of the All India Institute of Hygiene and Public Health. This institute will assist the Corporation of Calcutta to carry out the program of the unit.

Report of World Health Organization's Regional Director.—In his annual report to the World Health Organization's regional committee for Southeast Asia, Dr. C. Mani stated that measures for the control of malaria are expected to cover most of the affected area by 1958. The program has 134 units and serves 125 million people. The BCG program continues as the largest operation of this kind in the world, with over 43 million persons having been tested and 14 million vaccinated by the end of 1954. A large-scale training program of nurses, midwives, and other health personnel is being conducted. A plant in Calcutta is now producing cardiolipin, and it is hoped that the entire requirements of this antigen for Southeast Asia will soon come from this plant.

Indian Medical Association.—The working committee of the Indian Medical Association passed a resolution in October asking the members of the Indian Medical Association not to give training to those who were unlikely to practice "modern medicine." The committee also gave full support to the BCG vaccination campaign of the state governments.

LAW DEPARTMENT

MEDICOLEGAL ABSTRACTS

Malpractice: Full Disclosure of Dangers of Treatment Not Always Necessary.—The plaintiff filed an action against the defendant dermatologists for damages caused by their alleged malpractice in the administration of gold sodium thiosulfate injections. From an adverse judgment, the plaintiff appealed to the Supreme Court of Washington.

The plaintiff consulted the defendant dermatologists concerning skin lesions on his face and neck, which they diagnosed as chronic discoid lupus erythematosus. A recognized treatment for this disease consists of periodic injections of heavy metal salts, the continuity of which must be maintained. After a series of bismuth injections the plaintiff was started on a course of gold sodium thiosulfate therapy. Since gold sodium thiosulfate has a possible toxic effect on some persons, the defendants, in accordance with their usual procedure, first gave the plaintiff a small injection of the gold sodium thiosulfate. When the plaintiff appeared the next week for his second, and larger, injection, he complained of muscle soreness in his neck, joint pains, and pains in his arms and stated that he did not think he should have the injection that day. The defendants, after examining the plaintiff, and inasmuch as the plaintiff did not complain of or manifest any symptoms that disclosed an adverse reaction to the therapy, gave the plaintiff an injection of gold sodium thiosulfate. Shortly after this injection was given, the plaintiff developed hepatitis resulting in jaundice.

The plaintiff contended that the defendants caused the jaundice by negligently administering excessive amounts of heavy metal salts, over the protest of the plaintiff, after toxic symptoms had developed and that they were negligent in treating him without warning him of the dangers incident to the treatment.

The Court said that in order for a physician or surgeon to be liable for malpractice, he must have done something in the treatment of his patient that the recognized standard of medical practice in his community forbids or he must have failed to do something required by that standard. Except in those cases where the negligence is so gross as to be readily apparent to a layman, a finding of negligence on the part of a physician or surgeon must be based on medical testimony that shows that he departed from the recognized standard of practice of the community. The trial court found that treatment with heavy metal therapy and the dosages and intervals at which the injections were given represented the standard practice of dermatologists in the community; that it was not the standard practice to tell the patients all of the risks involved (whether a patient is advised of the risks depends upon the judgment of the individual doctor, exercised in the light of the mental and psychosomatic make-up of the patient); that it was standard practice, when possible symptoms of toxicity arose, to evaluate them in relation to the progress made in the therapy in making a decision whether to stop or continue the treatment. The Supreme Court said that, since these findings of fact by the trial court were supported by the record, it could not disturb them.

Accordingly the judgment in favor of the defendant physicians was affirmed. *Woods v. Pommerening et al., 271 P. (2d) 705 (Wash., 1954).*

Drunkenness: Defendant's Failure in Submitting to Chemical Test.—The defendant was charged with the crime of driving a motor vehicle while intoxicated. From a judgment of conviction he appealed to the Supreme Judicial Court of Maine.

On Nov. 2, 1952, the defendant drove up to a place in Rumford that was being investigated for violation of the liquor law. When he got out of his car, he appeared to be intoxicated. His condition was witnessed by a number of persons, and a deputy sheriff told him to "take off," which he did. The defendant was arrested on Nov. 13, when an indictment was returned against him. At the trial the defendant's main argument was that the delay in obtaining his arrest deprived him of his right to have a blood test taken to determine the alcoholic content of his blood at the time of the alleged crime and that this delay amounted to a deprivation of his constitutional rights.

By statute in Maine the results of blood tests to show the alcoholic content of one's blood at a particular time may be admitted in evidence. The foregoing "blood test statute" gives a respondent no "privilege." Any person can have a blood test at any time, and the result can be testified to in court under the common law as a scientific fact. The respondent was not deprived of his right to have a blood test. He had time and opportunity to go to a doctor and get one if, in fact, he desired one. He was not prevented by any act of the state's officers. If this statute gave a "privilege," as the respondent in this case claims, every driver of an automobile who drives under the influence of liquor must be arrested immediately. No person thus breaking the law could ever be convicted and sentenced unless he was "found" so driving, immediately arrested, and at once permitted to have a blood test if he requested. This would practically result in a statute of limitations of not more than a few hours, which is an absurdity. The Court failed to find in the case at bar that any right of this respondent had not been protected.

Accordingly, the judgment of conviction was affirmed. *State v. Demerritt, 103 A. (2d) 106 (Maine, 1953).*

Drunkenness: Taking of Blood Sample from Unconscious Person.—The petitioner filed a habeas corpus proceeding against the warden of the penitentiary in which he was imprisoned. The case was heard by the Supreme Court of New Mexico.

The petitioner was being held under a sentence for involuntary manslaughter, his conviction being based in part on the results of a test for intoxication, which was made from a sample of his blood. The sample was taken after an accident and while he was unconscious. The petitioner contended that the taking of the blood sample and the admission in evidence at the trial of the results of the test made of such sample was a denial of due process under the 14th Amendment of the Constitution of the United States.

The Court pointed out that the United States Supreme Court has held that a conviction, in a state court, based on evidence obtained in an illegal search and seizure is not a denial of due process under the 14th Amendment. The privilege against self-incrimination applies only to spoken evidence obtained by compulsion and not to real evidence, such as the results of an involuntary blood test. The taking of a blood sample in the usual fashion, such as was done in the present case, is not in and of itself so brutal and shocking as to offend the community's sense of justice and fairness. The taking of the sample while the petitioner was unconscious was not, therefore, a denial of due process.

The petition for a writ of habeas corpus was therefore denied. *Breithaupt v. Abram, 271 P. (2d) 827 (N. Mex., 1954).*

MEDICAL FILM REVIEWS

Surgical Anatomy of the Female Pelvis: 16 mm., color, sound, showing time 11 minutes. Prepared by Conrad J. Baumgartner, M.D., College of Medical Evangelists, Los Angeles. Produced in 1954 by Billy Burke Productions, Hollywood, for and procurable on loan from E. R. Squibb and Sons, 745 Fifth Ave., New York 22.

The purpose of this film is to demonstrate the surgical anatomy of the female pelvis. Using a combination of drawings and live photography of the pelvic cavity, the film first locates the various organs with complete anatomic accuracy and then demonstrates their locations as well as their anatomic landmarks. As a result of the effort to supplement the film with drawings, there are some defects, omissions, and weaknesses. For example, the attachment of the round ligament on the posterior surface of the cervix is too far lateral, the interstitial portion of the fallopian tube is not mentioned, and the description of the broad ligament as a tent-like structure is not clear. Gynecologists presenting this film to students will have to make supplementary remarks that will complement and clarify some of the minor inaccuracies in the narration and the drawings. In spite of these short-comings the film is recommended for those who are interested in gynecologic surgery and who are seeking better knowledge of fundamental anatomy. The photography is excellent.

MEDICAL LITERATURE ABSTRACTS

INTERNAL MEDICINE

Cortisone in Ulcerative Colitis: Final Report on a Therapeutic Trial. S. C. Truelove and L. J. Witts. Brit. M. J. 2:1041-1048 (Oct. 29) 1955 [London, England].

A therapeutic trial of cortisone in nonspecific ulcerative colitis was carried out in five different regions in Great Britain, and a preliminary report of the immediate results appeared in the *British Medical Journal* (2:375 [Aug. 14] 1954; abstracted in THE JOURNAL, Nov. 20, 1954, p. 1200). Of the 210 patients with chronic ulcerative colitis reported on, 109 were treated with cortisone, the usual dose being up to 100 mg. daily for six weeks, and 101 who were given placebos served as controls. The attending physicians were not informed which preparation the patient was receiving. In the present paper results of follow-up of 205 of these 210 patients for an average period of 18 months are reported. At every stage of severity of the illness and in both first attacks and relapses, the cortisone-treated patients did better than the corresponding control patients. Cortisone was particularly beneficial in first attacks of the disease. Patients treated with cortisone were somewhat more likely to suffer from pyogenic complications and eye complications than patients not so treated, but the two groups did not differ appreciably in other complications such as polyposis, thromboembolic complications, aplastic blood disorders, and ulcerative stomatitis. To minimize the risk of pyogenic complications in patients treated with cortisone, it seems advisable to combine cortisone with penicillin or sulfonamides. Sigmoidoscopy was carried out at the end of the treatment in 120 patients so that comparison could be made with the sigmoidoscopic appearances before the institution of treatment. Normal or improved sigmoidoscopic appearances were more frequent in the cortisone-treated group than in the controls. Similarly, in 51 patients examined roentgenologically with the aid of barium enema at the end of the treatment, improvement in the radiological appearances was more common in the cortisone-treated patients. Of 16 patients who died in the course of the treatment or within the next two months, 5 were in the cortisone-treated group (a mortality rate of 4.6%) and 11 (10.9%) were in the control group. Eight of the deaths occurred among the 24 patients who underwent ileostomy; two of the eight were in the cortisone-treated group and six in the control group. Nine months after the trial period, patients treated with cortisone in the first attack of ulcerative colitis preserved a clear advantage over the corresponding control patients. By contrast, patients treated with cortisone for relapses had lost the initial advantage they showed at the end of the trial period. After 18 months of follow-up, essentially the same pattern was observed as at 9 months, but with a slight worsening of the general aspect. In addition to the 24 patients who underwent ileostomy in the course of the trial period or shortly afterwards, 20 patients underwent ileostomy during the follow-up period; of these 44 patients, 14 (31.8%) were dead at the end of the authors' study. Cortisone is a valuable addition to the medical treatment of ulcerative colitis. It seems likely that better short-term results than those obtained in the present trial could be achieved by the use of higher doses of cortisone when necessary. However, the effect of cortisone is far from permanent, particularly in the established disease, though it is possible that more prolonged treatment than that practiced in the authors' patients will give better long-term results.

Treatment of Epidemic Hepatitis with Cortisone. W. Siegenthaler and L. Suter. Schweiz. med. Wchnschr. 85:1051-1053 (Oct. 22) 1955 (In German) [Basel, Switzerland].

Of 50 patients with epidemic hepatitis, 25 were treated with cortisone and 25 received no cortisone but, instead, infusions of 20 to 40% levulose (*d*-fructopyranose) solution (Laevosan). Both groups of patients were given bed rest and dietetic treatment. The cortisone-treated group received orally on 10 successive days doses of from 100 to 200 mg. of hydrocortisone, depending on the severity of the hepatitis. On the last two or three days of treatment these doses were usually reduced. Cortisone had a definite effect on the course of the disease. This became evident particularly in the decided and rapid improvement in the general condition with improvement in appetite and in the rapid reduction in the serum bilirubin content, which was much slower in the patients who did not receive cortisone. As regards the mode of action of cortisone on the hyperbilirubinemia, the authors believe that its anti-inflammatory effect restores the bile flow that was blocked by the serositis. Increase in hepatic glycogen may also play a part. Some of the undesirable secondary effects of cortisone therapy became evident in that despite low salt intake many of the patients showed retention of water and four showed glycosuria, but these secondary effects promptly subsided after cortisone treatment was discontinued. Relapses of hepatitis occurred in 6 of the 25 patients, but these again responded to cortisone therapy. This suggests that in some cases cortisone may interfere with the immunizing process. For this reason the authors advise against the routine use of cortisone in epidemic hepatitis, preferring its restriction to severe cases. They feel that a damaging effect on the liver is not to be feared with orally given doses of 100 mg. of hydrocortisone for 10 days. Cortisone, together with the customary infusion therapy, should be used also in hepatic coma as long as other measures have little effect in this condition. . . .

Hiatus Hernia and Angina Pectoris. H. Schmid and G. Biörck. Klin. Wchnschr. 33:928-931 (Oct. 15) 1955 (In German) [Berlin, Germany].

The differentiation between hiatus hernia and angina pectoris may be extremely difficult because substernal pain, sometimes with radiation to arm and hand, is the chief symptom in both conditions. On the basis of a case history and a review of the literature, the authors discuss the relationship of esophageal disorders and heart symptoms, pointing out that the topographic anatomy of the esophageal hiatus shows the close connection between the esophagus, the two vagus nerves, and the wall of the left ventricle. Then they call attention to the factors that are important in the differentiation between esophageal hiatus hernia and angina pectoris. In diaphragmatic esophageal hiatus hernia, the substernal pains generally radiate to the right shoulder, and, whereas patients with hiatus hernia rarely obtain relief by glyceryl trinitrate (nitroglycerin), this medication nearly always gives relief in coronary diseases. The administration of atropine has the opposite effect. Attacks of pain after eating or while lying down are usually caused by hiatus hernia. Patients with angina pectoris have attacks of pain after exertions and emotional excitement. Work tests with electrocardiography may prove valuable in the differentiation, but a negative exertion test does not exclude angina pectoris, and even a positive test is not always decisive. If symptoms of coronary disease exist without objective signs of a heart lesion in a patient in whom roentgenography reveals a hiatus hernia, the authors feel that a thorough history will be helpful to decide whether the hiatus hernia is the cause of the coronary symptoms or whether the hiatus hernia is a secondary disease. The less the coronary symptoms give the im-

The place of publication of the periodicals appears in brackets preceding each abstract.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individuals in continental United States or Canada who subscribe to its scientific periodicals. Requests for periodicals should be addressed "Library, American Medical Association." Periodical files cover 1946 to date only, and no photoduplication services are available. No charge is made to members, but the fee for others is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time, and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

pression of a typical exertion angina, the more thought should be given to hiatus hernia. Conservative treatment of the hiatus hernia should be instituted, and the success or failure of this treatment will be an aid in the differentiation between hiatus hernia and coronary disease. Furthermore, some of the general recommendations for the relief of the symptoms of hiatus hernia will also be of therapeutic value in coronary disease. The further course of the hiatus hernia will then make it possible to decide on the need for the surgical treatment.

Chronic Bronchitis: The Effect of Cigarette-Smoking. N. C. Oswald and V. C. Medvei. Lancet 2:843-844 (Oct. 22) 1955 [London, England].

The authors mention the following six factors as contributing to the development of chronic bronchitis: infection, polluted inspired air, the accompaniments of poverty, allergy, heredity, and the degenerative changes of advancing years. In addition, chronic bronchitis may be secondary to various pulmonary and general diseases. Assessment of the relative importance of any one factor is likely to be hazardous and can best be undertaken by selecting a group of people as similar as possible in all other respects. In the present instance the factor of cigarette smoking was investigated, and comparison was made of the prevalence of minor respiratory symptoms and of bronchitis in smokers and nonsmokers. The prevalence of minor respiratory symptoms and bronchitis was investigated in 5,844 clerical workers and was compared with their smoking habits. The proportion of clerical workers having minor respiratory symptoms and bronchitis was consistently higher in smokers than in nonsmokers. The greater prevalence of bronchitis in the older age group was clearly shown. For the entire series, 36% of the smokers were free from respiratory symptoms, compared with 53% of the nonsmokers. About 48% of the smokers and 38% of the nonsmokers had "mild respiratory symptoms." This difference must be accounted for to some extent by the so-called smoker's cough. The prevalence of bronchitis in smokers of the two sexes is very similar; the differences in nonsmokers are small. These findings suggest that sex is not an important factor in the development of bronchitis among persons living and working in similar circumstances.

The Treatment of Diastolic Hypertension with a Fixed Combination of Hypotensive Drugs. J. M. Waldron, D. J. Reinhardt III, W. K. Jenson and F. Goldstein. Am. J. M. Sc. 230:551-557 (Nov.) 1955 [Philadelphia].

The authors have had experience at their clinic with all presently used types of hypotensive drugs, given singly and in various combinations. When a combination of Rauwolfia serpentina, protoveratrine, and phenoxybenzamine (Dibenzyline) in a single capsule became available, they began a therapeutic trial with this compound. Of 75 patients selected for study only 38 were followed for a minimum of six months' treatment and were fully evaluated. The evaluation of changes in the blood pressure was based chiefly on the diastolic pressure. Nineteen of the 38 patients achieved consistently normal diastolic pressure; 9 additional patients had a fair response. Thus 28 of 38 patients showed a satisfactory response. The remaining 10 patients, most of whom had severe hypertension or hypertensive cardiovascular disease, responded unsatisfactorily or not at all. None of the patients with nitrogen retention responded satisfactorily. There were no other features that permitted the prediction of the hypotensive response in the individual patient, although as a group patients with the severest type of hypertension did much worse than patients in the less severe groups. The decline in blood pressure was usually delayed and gradual in patients responding favorably. In some patients a good response was seen after two weeks, but in the majority it took four weeks before a significant drop in blood pressure was apparent, and the maximal therapeutic effect was frequently reached only after six to eight weeks. The pulse rate decreased concurrently with the blood pressure. The relatively slow rate of blood pressure reduction and the slow rate of climb when the drug is withdrawn are safety factors, and, together with the ease of administration and the minimum of severe side-reactions, are definite advantages. The main disadvantages are: the high incidence of minor annoying side-reactions, the failure of a rather large percentage of patients (about 30%) to respond, and the inability to predict the response in most instances.

Disability of the Knee Due to Referred Pain and Related Phenomena. R. J. Dittrich. J. Am. Geriatrics Soc. 3:800-803 (Oct.) 1955 [Baltimore].

Clinical observations have revealed pathological changes at two sites in the lower part of the back. The abnormalities consist of fibrosis of subfascial fat, with adhesions between this structure and the overlying lumbodorsal fascia. The locations of the alterations are the midsacral paraspinal region and the midlumbar region over the lateral portion of the sacrospinalis muscle. The pathophysiological effects derived from the lesions are predominantly referred pain and referred tenderness, appearing in the spinal segmental (sclerotomal) distribution of the nerves that receive the impulses at their source. The midsacral site lies within the sclerotomal field of the first sacral nerve; the midlumbar site is supplied by the second lumbar nerve. A characteristic clinical picture of disability of the knee may develop. The outstanding features are *pain on the anteromedial aspect of the* knee, less commonly in the lateral portion; onset without known cause or, at times, related to minor injuries; disability due to pain on use, often sufficiently intense to preclude work; absence of objective evidence of serious injury; and moderate to marked *tenderness elicited on the anteromedial or anterolateral aspect* of the joint and extending above and below the joint line for a distance of 2 or 3 in. The diagnosis is made from the pattern of distribution of the referred pain and tenderness, together with demonstration of a significant degree of tenderness at the sites of the trigger-points, in the sacral and lumbar regions. Local anesthesia by infiltration of the subfascial space in the sacral region is employed as a diagnostic measure and, not uncommonly, provides substantial or complete relief of symptoms. In some instances, surgical correction is indicated. The author presents the histories of four patients to illustrate this form of disability of the knee.

A Case of Takayashu's Syndrome: The Pulseless Disease. L. Trias de Bes, J. G. Sanchez Lucas and F. Ballestra Barcons. Brit. Heart J. 17:484-488 (Oct.) 1955 [London, England].

The most striking feature of Takayashu's or pulseless disease is the complete absence of arterial pulsation in the main arterial trunks arising from the aortic arch. It was first described by the Japanese ophthalmologist Takayashu in 1908. His attention was drawn to the serious ocular accompaniments. Japanese authors have described a total of 58 cases. After citing three previous European reports, the authors present a new case, which they believe is the 37th of the non-Japanese cases hitherto reported. The patient was a 19-year-old woman. She was of asthenic constitution but had been able to work in the household and on the farm. At the age of 18 she had aural vertigo and some short syncopal attacks with slight convulsions. She was complaining of progressive weakness and had noticed undue muscular tiredness in both arms, so that she was apt to drop things; this was due to intermittent claudication of the arms. In 12 months there had been three bouts of transitory hemiparesis, lasting for about half an hour, accompanied by dysarthria. Abrupt movements of the head accentuated the giddiness and even provoked syncope. The patient had hypersensitivity of the carotid sinus and frequent pains in the head. A few weeks after the onset of the illness, ocular troubles set in with progressive blurring of vision. There was total loss of sight in the right eye two months before admission to hospital. The results of the clinical, laboratory, and ocular examinations corroborated the diagnosis of pulseless disease. Throughout the year in which the patient has been under clinical observation, there has been no change in the cardiovascular state. In a quiet environment and with avoidance of effort, there has been no repetition of the cerebral ischemic episodes or the claudication of the superior extremities. The ocular disturbances have, on the other hand, become progressively worse. Mesenchymal abnormalities observed in the enucleated eye suggested a possible congenital basis for the disease.

Diabetic Amyotrophy. H. Garland. Brit. M. J. 2:1287-1290 (Nov. 26) 1955 [London, England].

A syndrome that includes weakness and wasting of muscles with tendon areflexia, associated with frank diabetes mellitus or at least with impaired glucose tolerance, is described in 12 patients all of whom with the exception of one were over 50 years of age. Less constant features were extensor plantar responses, a raised protein content of the cerebrospinal fluid, and electromyelographic changes in the affected muscles often compatible with a cord lesion and sometimes appearing to be of peripheral origin. There is evidence that some of these cases resulted from a myelopathy and that changes may occur at any cord level, though they are most commonly seen in the lumbar region. Pain of a similar distribution to the amyotrophy was a frequent though not constant feature. The protein content of the cerebrospinal fluid may be normal or raised. At the present time "diabetic amyotrophy" would appear to be the best term to apply to the syndrome. Since it is generally accepted that diabetic neuropathy is usually purely sensory and is determined by peripheral nerve changes only, it may equally well be true that diabetes can produce changes limited to the motor fibers of peripheral nerves. But it would seem that diabetic amyotrophy is always a reversible process no matter where the anatomic disturbance appears to be. Although diabetes mellitus may determine changes in the spinal cord it may presumably result in changes in the peripheral nerves of the same patient at the same time. Sensory loss has been largely absent in the author's patients, but the findings of sensory loss in no way vitiates the diagnosis of "diabetic amyotrophy." Diabetic amyotrophy is the result of uncontrolled diabetes mellitus and is probably always reversible by full diabetic control.

An Evaluation of the Urinary Uropepsin Excretion in Distinguishing Benign from Malignant Gastric Ulcer. S. J. Gray, C. G. Ramsey, R. W. Reifenstein and L. J. Krakauer. Gastroenterology 29:641-652 (Oct.) 1955 [Baltimore].

The uropepsin excretion in the urine reflects the peptic activity of the stomach. It is derived from the secretion of pepsinogen directly into the blood stream by the peptic cells. Pepsinogen is then transported to the kidneys and excreted in the urine as uropepsin. Uropepsin measures the pepsinogen production of the stomach as evidenced by the disappearance of the enzyme from the urine after total gastrectomy and its absence in patients with pernicious anemia. Previous studies indicated that it is an accurate reflection of gastric pepsin secretion. The purpose of this presentation is to evaluate the possibility of distinguishing gastric cancer from benign gastric ulcer by measuring the 24-hour excretion of uropepsin in the urine. Previous studies in this field have been equivocal. The urinary uropepsin excretion was determined in a control group of 265 subjects, consisting of 120 hospitalized patients without demonstrable gastric disease and 145 unselected college students. Similar determinations were performed in 205 patients with duodenal ulcer, 90 patients with gastric ulcer, and 60 unselected patients with adenocarcinoma of the stomach. The diagnosis of gastric ulcer or cancer was established by microscopic examination of surgically resected specimens, postmortem examination, or by clinical evidence of complete healing and disappearance of the ulcer by x-ray and gastroscopic criteria. The authors found that the mean uropepsin output in gastric ulcer was 5,756 units; it was significantly higher than the normal of 3,670 units, although lower than in the duodenal ulcer group in which it was 8,471 units. A low mean uropepsin excretion of 1,815 units was observed in gastric cancer. The lowest mean values (13 units) appeared in 70 patients with gastric atrophy of pernicious anemia. A uropepsin excretion below 1,000 units was found in only 1.1% of the gastric ulcer patients, contrasted to 55% of the gastric cancer group. Uropepsin values above 3,000 units were observed in 100% of the patients with duodenal ulcer, in 79.6% of those with gastric ulcer, and in 21.7% of those with gastric cancer. Although the uropepsin excretion appears to parallel the basal hourly secretions of free hydrochloric acid in the gastric juice, a normal or high uropepsin output was observed frequently in gastric ulcer patients in spite of low gastric acidity. This disparity may prove significant in distinguishing benign from malignant disease. In the presence of an ulcerating gastric lesion, a uropepsin excretion of 1,000 units or less indicates a high probability of cancer. An elevated uropepsin excretion above 3,000 units favors, but does not prove, the benign character of the lesion. Since only 55% of gastric cancer patients excreted less than 1,000 units, the uropepsin determination is not suitable as a screening test for gastric cancer. It may prove useful in conjunction with other screening procedures.

Alkaline Treatment of Acute Allergic Shock. H. G. Clark. J. Michigan M. Soc. 54:1198-1199 (Oct.) 1955 [St. Paul].

In conformity with the acid-anoxi-endocrine theory of allergy, Clark has been giving sodium bicarbonate and potassium bicarbonate, in various proportions and amounts, to patients with acute and chronic allergic manifestations. Five grams of the combined alkalis dissolved in water is given every hour or two for one, two, or three doses with consistently good results, particularly in the acute cases of allergy. Chronic allergic diseases such as asthma involve more than one pathological change and are not so much benefited by the alkalis as is acute allergic shock. In anaphylactic shock due to penicillin, the recovery is rapid and complete, so much so that the author discontinued giving any other medicaments such as adrenalin, aminophyllin, and the antihistaminic drugs. He has resorted in the last eight months to the intravenous injection of sodium bicarbonate to patients with severe allergic reactions to penicillin or other allergic attacks. The solution used is available in an ampul containing 3.75 gm. of sodium bicarbonate in 50 cc. of water. The author also used 1/6 molar sodium lactate. With the intravenous use of the alkali the effect is very rapid, occurring in from 17 seconds to a minute or two; with orally given medicaments, from 20 minutes to an hour elapses before improvement is evident. Time is a very important factor, particularly in allergic shock caused by penicillin, and the intravenous administration may be of vital importance. Histories of four patients are presented that are typical of many others. No other treatment except the alkalis was needed. The dramatic speed of recovery suggests that the alkali corrects some basic physiological mechanism involved in the allergic reaction. Sodium lactate has been used intravenously in five cases of surgical shock and hemorrhagic shock. When more prolonged and less prompt action is desired, such as during a major operation, lactate solution is preferable to the sodium bicarbonate. This last should be used with caution when cardiorenal, hypertensive, and arteriosclerotic diseases are present. It is poorly excreted and has pressor effects. It should not be used in severe edema, since it increases the edema. In these latter cases, the proportion of potassium should be changed. In an emergency these cautions can be ignored, since they may be corrected when the emergency is passed.

Incidence of Clinical Hypersensitiveness to Medications in Patients with Bronchial Asthma. G. Franceschini. Prog. med. 11:431-436 (July 31) 1955 (In Italian) [Naples, Italy].

A study was made of 613 patients with bronchial asthma who were seen at the University of Rome outpatient clinic for allergic diseases from 1952 to 1955 to determine the incidence and type of clinical hypersensitiveness to various medications. Skin reaction tests to exogenous allergens responsible for the asthmatic syndrome were positive in 310 patients, most of them in the 10 to 40 year age group, and negative in the others, most of them in the 40 to 70 year age group. Of the 613 patients, 51 (8.38%) showed clinical hypersensitiveness to drugs; 8.38% of these were patients with a positive skin reaction and 8.24% with a negative skin reaction. Hypersensitiveness to acetylsalicylic acid was the most frequent (3.73%), and this high incidence is ascribed to the fact that acetylsalicylic acid is the medicament used most frequently by patients with bronchial asthma. Hypersensitiveness to aminopyrine and its derivatives was the next most common. The clinical manifestations of intolerance were urticaria, bronchial asthma, angioneurotic (Quincke's) edema, serum sickness, erythema, cutaneous purpura, and fever. In none of the patients were the drugs the first cause of asthma. They did, however, aggravate it, especially when it was already rather grave and had become resistant to the common therapies. Scratch tests with drugs were always negative except in one instance in which a patient showed a positive reaction to acetylsalicylic acid.

Largactil in Treatment of Hemorrhagic Shock. S. Fertitta and E. Scio. *Minerva chir.* 10:811-815 (Aug. 31) 1955 (In Italian) [Turin, Italy].

The antishock action of chlorpromazine (Largactil) was studied in dogs from which about 600 to 1,100 cc. of blood (approximately three-fourths of the total blood volume) was withdrawn. Some of the dogs were given 2.5 mg. of chlorpromazine per kilogram of body weight intravenously before, and another such dose intramuscularly after, the blood was removed. Others that served as controls were not given the ganglioplegic drug. This did protect the animals of the first group from the shock that generally follows a profuse and rapid loss of blood. A soporous state with slowed down reactions to stimuli lasted in these dogs for about 6 hours, but within 24 hours all of them were again normal, and no death was recorded. In the controls, however, the state of shock, with polypnea, tachycardia, drop in blood pressure, and even diarrhea, in some instances, was so pronounced that it caused the death of two animals. The authors attribute the antishock effect of chlorpromazine to its marked adrenolytic action, which prevents the onset of the vasoconstriction that is secondary to the first manifestations of shock. The better tissue oxygenation that this drug brings about also plays a part in preventing the onset of shock.

SURGERY

Direct-Vision Suture of Interatrial Septal Defect During Hypothermia. H. Swan, S. G. Blount Jr. and R. W. Virtue. Surgery 38:858-871 (Nov.) 1955 [St. Louis].

The authors review the history of the surgical methods employed in the treatment of interatrial septal defects. Believing that direct vision is an important principle in this form of surgery, they concentrated their effort on hypothermia, which allows a short period for intracardiac repair under direct vision. Their method consists of reducing the body temperature to approximately 26 C by immersion in ice water. In the past three years, 100 patients having atrial septal defects have been evaluated and, of this number, 30 have been selected for closure of their defect under direct vision during hypothermia. Three had primum lesions; the remainder were of the secundum type. The authors recognize the profound difference in the physiological and anatomic pathology between primum and secundum lesions. They make a strong plea to separate these entities so that comparative evaluations can be meaningful. Of 27 patients having secundum type lesions, 5 had associated cardiac anomalies exclusive of aberrant pulmonary veins entering the right atrium, and 23 survived. Of three patients with primum lesions, only one survived, uncured. Postoperative catheterization data are available on 21 patients and reveal closure of the defect in all but 2. Total closure of the anatomic defect is essential if the disordered physiology is to be cured. Eighty per cent closure will have little or no effect upon the volume of the shunt. For the direct-vision closure of very large defects, a continuous suture is preferable to an interrupted one if complete closure is to be achieved. In the secundum type of atrial septal defects, direct suture during hypothermia is very effective and involves slight risk. Patients with secundum defects who have a large left-to-right shunt should be offered operation at an early age, before they begin to have excessive dilatation of the pulmonary arterial tree, cardiac enlargement, or progressive elevation of pulmonary resistance, since the risk of operation is quite low before these changes occur. Patients with extremely high pulmonary resistance and minimal or reversed shunts have passed the stage at which surgical treatment will be of benefit.

The Diagnosis and Treatment of Tricuspid Atresia. W. L. Riker and R. Miller. Surgery 38:886-902 (Nov.) 1955 [St. Louis].

Tricuspid atresia is not merely a fusion of the valve cusps but an absence of valve structure. Solid myocardium separates the right atrium from the right ventricle. There is always an interatrial septal defect. Variations of this basic pattern depend upon the degree of patency of the pulmonary outflow tract and the position of the great vessels. Three variations of tricuspid atresia are explained. In the past 10 years, 51 patients with tricuspid atresia have been studied at the Children's Memorial Hospital in Chicago. Sixteen patients were not operated on, but 35 underwent aortic-pulmonary anastomosis or similar procedures. The presence of left heart strain and peaked, prominent P waves in the electrocardiogram of a cyanotic infant with relatively normal heart size was diagnostic of tricuspid atresia. A history of cyanosis from birth was almost constant, and dyspnea, weakness, and failure to gain weight were common. Some patients had episodes of unconsciousness, usually following crying or feeding. Decreased exercise tolerance was usual in the older children. A loud, harsh systolic murmur was usually heard best in the third intercostal space to the left of the sternum. Chest fluoroscopy was helpful in that it revealed absence of right ventricular enlargement as an aid in differentiation from other types of cyanotic congenital heart disease. Electrocardiographic evidence of left ventricular hypertrophy was present in every patient in this series. Eighty per cent of the children were less than 3 years old when they came for operation or died untreated. A newly devised Potts-Smith operation was performed on a patient with tricuspid atresia in January, 1947. The authors describe the technique that was gradually developed for use in infants only a few weeks or months old. Of the 35 patients who underwent aortic-pulmonary anastomoses, none died during the procedure, but 5 died within 14 days after operation, either of heart failure or pulmonary infarcts secondary to thrombosis at the anastomosis. Two of the 30 patients who were discharged from the hospital obtained poor clinical results and retained persistent heart failure. The other 28 patients had good immediate results; their cyanosis disappeared, they were normally active, and the spells of unconsciousness did not recur. A few patients had mild congestive failure easily controlled by digitalis. There have been five late deaths. Nineteen of the remaining 25 children, who have been followed for from four months to eight years, obtained good results. Five patients, classified as having fair results, have a mild degree of congestive failure controlled fairly well by digitalis. One patient, with transposition of the great vessels and pulmonary stenosis operated on four months ago, is in congestive failure now, but improvement may occur over the next few months as it has with several patients. Young children with tricuspid atresia often became progressively more cyanotic and dyspneic as their ductus arteriosus narrowed and obliterated. In this group the mortality is practically 100% without operation. Therefore, if an infant with tricuspid atresia becomes progressively more cyanotic and dyspneic and begins to have spells of apnea or unconsciousness, an aortic-pulmonary anastomosis should be performed as soon as possible, even though the patient is extremely young and small.

Repair of the Partial Form of Persistent Common Atrioventricular Canal: So-Called Ostium Primum Type of Atrial Septal Defect with Interventricular Communication. J. W. Kirklin, G. W. Dougherty, H. B. Burchell and E. H. Wood. Ann. Surg. 142:858-862 (Nov.) 1955 [Philadelphia].

A case of so-called ostium primum type of atrial septal defect with interventricular communication is described in a 27-year-old woman who complained of dyspnea, fatigue, and mild chest pain on exertion, of three years' duration. The patient's systemic blood pressure was 96 mm. Hg systolic and 60 mm. Hg diastolic. A systolic murmur, grade 1, heard in the pulmonic valvular region, was more prominent after exercise. The second sound in the pulmonary area was accentuated, grade 1. Roentgenograms and fluoroscopic examination of the chest revealed enlargement of the pulmonary trunk, pulmonary arteries, and right ventricle, with increased pulsation of the pulmonary arteries. The electrocardiogram was interpreted as showing right bundle branch block. A diagnosis of partial form of persistent common atrioventricular canal was made preoperatively and surgical repair was effected as follows. The patient's chest was opened through an anterolateral incision through the fifth interspace. The right pulmonary veins were enlarged and could be seen to empty in the left atrium. The right atrium was enlarged. A soft, short systolic thrill was felt over the base of the pulmonary trunk. The atrial well of Gross was sutured onto the right atrium in the usual fashion. A defect in the lowest portion of the atrial septum measured about 4 to 4.5 cm. This defect was in communication with a cleft between the mitral and tricuspid valve rings and lower down, with a defect involving the portion of the ventricular septum immediately beneath the atrioventricular valves. The mitral valve was competent, and its leaflets were not cleft. The tricuspid valve was competent without regurgitation. A finger could be passed easily from the right atrium into either the left atrium or the left ventricle. A piece of polyvinyl plastic sponge about 3 mm. in thickness was trimmed to the proper size and sutured into place. The well was disconnected after being in place one and a half hours, and the defect in the right atrium was closed in the usual fashion. The postoperative course was uneventful. No evidence of heart block occurred. Study by cardiac catheterization four months after operation showed that the defects in both the atrial and ventricular septums were completely closed, and the heart was hemodynamically normal. The successful complete closure of this complicated type of defect may not be possible in every case. Evidence of mitral insufficiency would be considered a definite contraindication to exploration. A polyvinyl plastic sponge seems ideally suited to use in closure of the septal defects of the partial form of persistent common atrioventricular canal; when carefully sutured to the edges of the defect, the sponge soon becomes incorporated firmly into the septum and seems likely to remain permanently in place.

Some Practical Considerations in the Surgery of Blood Vessel Grafts. R. R. Linton. Surgery 38:817-834 (Nov.) 1955 [St. Louis].

After discussing the indications for reestablishing the arterial continuity of the aorta and major arteries, Linton comments on the various types of grafts: the autogenous venous graft, the homologous venous graft, and the homologous arterial graft, and on the use of synthetic fabrics. He believes that the use of the homologous arterial grafts is a method of treating aortic and major arterial lesions that supplants all others in many patients. It is a feasible procedure today because of better surgical equipment and suture material; the availability of the anticoagulant heparin to prevent the clotting of the blood during the operative procedure and the antibiotics to prevent infection; improved anesthesia techniques, including the catheter spinal type of anesthesia, which has been most commonly used; the better preoperative and postoperative care of these critically ill patients; and last and perhaps most important of all the fact that arterial homografts are now available in blood vessel banks for the performance of these highly technical procedures. The end-to-side type of vascular anastomosis has made it possible to extend the homografting procedures to include cases that could not possibly be accomplished with the end-to-end method. The chief contraindications to this type of surgery are (1) severe coronary disease, which would make these long operative procedures too dangerous to perform, (2) extensive obliterative arterial disease involving the aorta and the major arteries so that the grafts cannot be anastomosed satisfactorily to the host arteries, and (3) obliteration of the popliteal artery and its terminal branches.

The Use of Vessel Grafts in the Treatment of Popliteal Aneurysms. O. C. Julian, W. S. Dye, H. Javid and W. J. Grove. Surgery 38:970-980 (Nov.) 1955 [St. Louis].

The authors report on the results obtained in eight patients with implantation of a vessel graft after a complete resection. One patient had bilateral aneurysms, making a total of nine lesions operated on. Eight of these aneurysms were the result of arteriosclerosis and one was a micotic aneurysm occurring during the course of an acute subacute bacterial endocarditis. Five autogenous saphenous grafts, one homologous vein graft, and three frozen homologous artery grafts were used. One failure to preserve distal artery pulses is reported without serious results other than significant claudication. In this patient a lumbar sympathectomy failed to relieve this symptom. A second patient is included in whom sympathectomy was performed before the aneurysmectomy and the graft. The remaining seven lesions were removed and grafted without lumbar sympathectomy. In seven patients the pulse at the ankle was either restored or maintained. Two operations resulted in healing of gangrenous area on the toes. The authors noticed in all of the large aneurysms that the factor of elongation in the stretched vessel tended to angulate the anterior tibial artery. This should be considered one of the methods by which the pulsatile flow to the ankle is obstructed. In addition, a concomitant obstructive arteriosclerotic lesion may be present distal to the aneurysm. A second consistent observation was the infrequency with which open arteries branched from the aneurysm itself. Such arteries as the medial and lateral superior geniculate were either occluded in the wall of the aneurysm or were very small. After obtaining proximal control of the artery above the aneurysm, it was possible to open the aneurysm and, after evacuating clots, obtain control of these vessels flush with the wall of the aneurysm externally. Since they were small or occluded, it did not seem important that they be subjected to special handling. Wherever possible, a frozen homologous artery graft was used. Vein grafts were used when it was inconvenient to use an artery or when an artery was not available. There has been no observable difference in this period of observation in the late behavior of the two types of grafts.

Surgical Implications of Non-Thrombocytopenic Purpura. J. P. Muldoon, A. M. Berg and D. W. Kinnaird. Ann. Surg. 142: 817-823 (Nov.) 1955 [Philadelphia].

The occurrence of Henoch-Schönlein (anaphylactoid) purpura with prominent skin, joint, visceral, cerebral, renal, and ocular manifestations is described in three men, aged 59 years, 19 years, and 38 years, respectively. The presence of a palpable mass in the left upper quadrant of the abdomen associated with generalized, intermittent abdominal pain was a deciding factor in favor of laparotomy in the 59-year-old patient. A sharply demarcated segment of the jejunum was observed to be scarlet red, greatly enlarged, and indurated; this necrotic area of the jejunum influenced the surgeon, who feared perforation, to perform a segmental resection and end-to-end anastomosis. The patient died on the seventh postoperative day. The absence of joint pain and purpuric lesions of the skin on the admission of the 19-year-old patient with pronounced tenderness of the abdomen obscured the clinical diagnosis. Laparotomy was performed and the diagnosis of nonthrombocytopenic purpura was made from the appearance of the ileum. Postoperatively the patient was treated with rutin, and the purpura disappeared gradually. Abdominal cramps, severe vomiting, and rectal bleeding made exploratory laparotomy unavoidable in the third patient, but, in the lack of manifestations other than visceral, the diagnosis of nonthrombocytopenic purpura was made only at the surgical intervention. Postoperatively he was treated successfully with rutin and cortisone. The various manifestations of nonthrombocytopenic purpura may bring the patient to the neurologist, dermatologist, internist, ophthalmologist, or surgeon. The surgical implications are of paramount importance. There are only two indications for laparotomy, namely, perforation and intussusception. If laparotomy is performed and neither of these conditions exist, resection is not indicated, as the lesion will regress spontaneously. However, if impending perforation is suspected, the segment involved should be resected.

Pneumonectomy in a Two-Month-Old Infant with Pleuropulmonary Staphylococcia. M. Chevalley, J.-P. Binet and G. Vermeil. Presse méd. 63:1393-1394 (Oct. 19) 1955 (In French) [Paris, France].

Surgical treatment of staphylococcic infection in infants should be used only as a last resort, after medical treatment and drainage of air and pus have failed. The authors have most often used lobectomy in their refractory cases, but in three instances they performed pneumonectomy. Two of these patients died, one of associated purulent pericarditis and one from aspiration of vomited milk after a satisfactory postoperative result. The history of the third patient, a two-month-old baby girl, is presented in detail. Operation was considered indicated because of a sudden worsening of the general condition and persistence of a large bronchopulmonary fistula, despite initial improvement with antibiotic therapy and drainage. The postoperative course ran smoothly, but there was partial disunion of the thoracotomy scar and some local suppuration caused by the staphylococci, which had become resistant to all antibiotics. The authors realize that this serious operation, performed in a young child, is risky in many ways. In the case reported, however, it was justified because it clearly saved the patient's life.

Fibrosarcoma of Breast. P. A. Lodi and M. de A. Figueiredo. Rev. Assoc. med. brasil. **2**:49-54 (Oct.) 1955 (In Portuguese) [São Paulo, Brazil].

Two hundred ten cases of malignant tumor of the breast were observed in a large hospital of Belo Horizonte during the last 30 years. Three patients, two women and a man, had sarcoma of the breast. A woman 42 years old requested treatment for a small nodule that appeared on the right breast four months prior to consultation. Histopathological examination of the removed nodule showed sarcoma. A radical mastectomy followed. Histological examination of the removed breast showed a fibrosarcoma, which had originated on the basis of a preexisting fibroadenoma. The patient is in normal health with a survival period of more than 19 years since the operation. The operative scar and roentgenograms of the thorax are normal. The satisfactory results are due to early operation, moderate degree of malignancy of the tumor, and radical type of mastectomy. Fibrosarcoma of the breast is rare. The tumor may appear as a small nodule that remains unchanged for several years and then starts growing rapidly, or it may grow rapidly soon after it appears. Metastases and recurrences are frequent. Metastases travel via the blood to the lungs, pleura, liver, mediastinum, and other structures. In rare cases the tumor may give metastases by way of the lymph nodes. Malignancy of the tumor depends on the degree of histological differentiation of the tumoral tissue. Poorly histologically differentiated fibrosarcomas are more malignant than well-differentiated tumors. The treatment consists of radical mastectomy that prevents metastases through the lymph nodes, gives permanent cure, and does not interfere with the functional capacity of the arm.

The Value of Achlorhydria as a Screening Test for Gastric Cancer: A 10-Year Report. C. R. Hitchcock, W. A. Sullivan and O. H. Wangensteen. Gastroenterology **29**:621-632 (Oct.) 1955 [Baltimore].

In view of the high death rate from gastric cancer, the authors aimed at its early detection, preferably while symptoms are still absent. The studies described were begun in July, 1945, as a joint project between the departments of pathology, radiology, medicine, and surgery at the University of Minnesota Hospitals. All outpatient registrants over the age of 50 in the University Hospitals were tested for gastric hydrochloric acid secretion by the method of intubation, and three injections of 0.5 mg. of histamine phosphate were used for gastric stimulation. Those classified as achlorhydric or hypochlorhydric were selected for study. A total of 4,936 gastric analyses were performed and 1,563 patients were found to fit the criteria for this study. A group of 77 pernicious anemia patients, and a group of 107 achlorhydric patients were added to the study. The investigations indicated that patients with pernicious anemia should be subjected to gastric roentgen examinations every 6 months, and those with achlorhydria or hypochlorhydria every 9 to 12 months. In patients with gastric polyps, not only should the gastric polyps be removed but roentgen examination of the stomach should be carried out every 9 to 12 months. The authors found that the "silent" interval of gastric cancer lasted on the average 18 to 24 months. With a program of periodic reexamination of the more highly susceptible portion of the population, there is reasonable assurance that many more gastric cancers can be detected in the presymptomatic phase of the disease than has heretofore been possible. During a nine and one-half year follow-up of 1,747 patients who were designated as gastric cancer precursor patients, 55 gastric polyps and 19 gastric cancers were found. Of the 19 patients with gastric cancer, only 4 had symptoms that might have led them to seek diagnosis of their condition earlier. The incidence of gastric cancer in the achlorhydric group was 3.2 times the expected national incidence for persons in the same age group. The hypochlorhydric group showed 2.6 times the incidence, and the pernicious anemia group showed 18.3 times the incidence. The incidence in all the precursor groups was 3.8 times the national incidence.

Postmortem Skin Homografts in the Treatment of Extensive Burns. C. P. Artz, J. M. Becker, Y. Sako and A. W. Bronwell. A. M. A. Arch. Surg. **71**:682-687 (Nov) 1955 [Chicago].

Ideally, burned areas should be grafted with sheets of autogenous skin, but in the extensively burned patient there may be insufficient donor sites, and such patients may be unable to tolerate the additional trauma of having skin removed. Application of skin homografts in these patients provides only a temporary coverage of the wound, but this procedure provides time during which the patient's condition may be improved. After the application of homografts, there is less infection, less fibrosis, and less discomfort. Usually the patient's morale improves and his nutritional intake is increased. Thus, although homografts provide only a temporary coverage for the wound, they may be lifesaving in extensively burned patients. The use of skin from a cadaver is much more practical than homografts from living donors. Clinical experience with postmortem homografts during the past two years has demonstrated the success of these grafts in extensively burned patients. Typical case histories of five patients are recorded. Grafts were removed from donor bodies from three to seven hours after death. They survived from two weeks to 47 days. The use of postmortem homografts provided an easy, practical method of achieving temporary wound closure in extensively burned patients. The authors feel that postmortem homografts should be used more extensively. Further investigation is necessary on the time interval after death in which skin may be removed and on methods and length of storage prior to grafting.

Use of a Tantalum, Steel Wire, or Nylon Mesh in Surgical Repair of Abdominal Wall. N. Petrina and T. Mercadante. Minerva chir. **10**:747-754 (Aug. 15) 1955 (In Italian) [Turin, Italy].

The authors used a tantalum, steel wire, or nylon mesh for the surgical treatment of massive postoperative ventral hernia, recurrent inguinal hernia, and large umbilical hernia in 36 patients in whom there was reason to expect eventual recurrences had the standard surgical procedures been adopted. The wound healed by first intention in 30 instances and by second intention in 4. Only in two instances (in both a steel wire mesh had been used) was it necessary to perform another operation to remove the mesh. The resistance of the wall was not impaired, however, because an extensive connective tissue reaction had already taken place. The three types of mesh were always well tolerated; they did not cause immediate or late disturbances or irritation; and there was no relapse, not even in one patient who had had six recurrences in a short time. The tantalum mesh was the best of the three types, and, although infection occurred in 3 of the 15 patients in whom it was used, it was never necessary to operate again to remove the mesh. The steel wire mesh was tolerated less well. This does, however, have the advantage of being more resistant than the tantalum mesh, which has a tendency to break transversally, as a rule 6 to 10 months after its implantation. The nylon mesh was tolerated as well as the tantalum mesh and the wound healed by first intention in all the 11 patients in whom it was used. The authors' patients have been followed for from one and one-half to three years.

Experiences with a New Local Antibiotic (Nebacetin) in Surgery. H. Holzhausen. Medizinische, No. 44, pp. 1540-1545 (Oct. 29) 1955 (In German) [Stuttgart, Germany].

Nebacetin, a combined proprietary preparation of neomycin and bacitracin, which is on the market in the form of a solution, tablets, ointment, and powder, was used as an antibiotic for the local treatment of local bacterial infections in 100 patients, 58 of whom had been admitted to the surgical clinic of the University of Tübingen, Germany, and 42 treated ambulatorily. Twenty patients with complicated fractures, abscess of abdominal walls, empyema after pleurisy, chronic osteomyelitis, chondroma of the third metacarpal bone, necrosis of the femur, and subphrenic abscess, respectively, had previously been given penicillin, streptomycin, and sulfonamide preparations for periods up to one year but had not responded to antibiotics and chemotherapy. The other 38 hospitalized patients had infected injuries, postoperative infections, furuncles, carbuncles, and fistulas respectively. The ambulatory patients had infected injuries of fingers, paronychia, abscesses, furuncles, and carbuncles. The results obtained in these 100 patients were evaluated according to Meleney and Johnson's suggestions (J. A. M. A. 133:675 [March 8] 1947) as follows: results were excellent in 40 patients who were favorably influenced in 3 days, good in 43 who were favorably influenced in 8 to 10 days, and questionable in 7, and no effect was obtained in 10. Sixteen of the 20 refractory patients were favorably influenced. Nebacetin appears to be indicated particularly for the preparatory treatment of infected wounds for skin grafting. Compresses or continuous irrigation with Nebacetin caused the dirty coating of wounds to clear and produced fresh granulation surfaces. Local treatment with Nebacetin consisting of puncture, instillation after the removal of necrosis, and irrigation also proved highly effective in furuncles, carbuncles, abscesses, and fistulas. The value of local treatment with Nebacetin, preceding the surgical removal of foreign bodies, sequestrums, or necroses in cases of fistulas, consisted of making the operative area free of bacteria. Instillation of Nebacetin in residual empyema cavities made them free of bacteria for sterile surgical intervention. Infected injuries healed rapidly when Nebacetin powder or ointment was applied. Postoperative infections of wounds responded satisfactorily to dusting with Nebacetin powder. Continuous irrigation with Nebacetin made sterile open wound treatment possible. Failure of Nebacetin therapy resulted when it was impossible to achieve sufficiently close contact of the drug with the focus or adequate concentration of the drug, or when surgical intervention such as sequestrectomy was indispensable. The breadth of the spectrum of Nebacetin is similar to that of penicillin combined with streptomycin. The effect of Nebacetin is not inhibited by blood, plasma, pus or necrotic tissue. Ferments similar to penicillinase are not known for bacitracin and neomycin. The advantages of the Nebacetin therapy are good tissue tolerance, low incidence of resistance, rare sensitization, and broad spectrum effect. Nebacetin may be combined at any time with other antibiotics.

NEUROLOGY & PSYCHIATRY

Long Range Treatment of Multiple Sclerosis with Pancorphen. J. Wilder. J. Nerv. & Ment. Dis. **121**:545-552 (June) 1955 [New York].

Pancorphen is a heart muscle extract that has been digested with pancreatic extract; phenol is added to render it sterile and to increase its therapeutic effect. The author has tried this extract in hundreds of patients in the course of 25 years. The drug is generally administered intravenously in a series of five injections. The treatment is characterized by decided focal neurological reactions with very weak systemic reactions. Vasodilation is an outstanding clinical effect. Observations on 140 patients who were treated with only one series of Pancorphen injections were described by the author in an earlier report. In this paper he deals with the question whether a series of five Pancorphen injections, which yielded temporary, partial remissions in a high percentage of cases should be repeated. The observations he reports were made on 13 patients who received multiple treatment courses and who were followed for years. He found that partial remissions occur even in old and advanced cases, but in the form in which the treatments are now given no cures are produced. Repetition of the treatment course for from 4 to 26 times neither arrests the disease nor does it prevent relapses. Results are less favorable in advanced than in less advanced cases. Treatments started at the beginning of an attack produce better results than those started late in an attack. It appears that better results are obtained if treatments are repeated two or three times a year than at longer intervals. Progressive remissions are more frequent with than without Pancorphen treatment. Furthermore, the duration of attacks may become shortened to such a point that one may speak of aborted attacks. The author is unable to give a definite reply to the question whether the five-injection Pancorphen treatments should be repeated indefinitely at the rate of three times a year, but he is convinced that the treatments should be given at the onset of every attack, during active attacks regardless of duration, and during inactive as well as regressive remissions. Treatment during active phases requires more caution and more individualization than in the inactive stages. The active periods of disease, progressive attacks, or progressive remissions hold more promise for effective therapy than the inactive periods of stabilized defenses. The author feels that for the time being a series of five injections strictly individualized should be given three or four times a year plus emergency treatment in case of new symptoms.

The Use of Frenquel in the Treatment of Disturbed Patients with Psychoses of Long Duration. F. Rinaldi, L. H. Rudy and H. E. Himwich. Am. J. Psychiat. **112**:343-348 (Nov.) 1955 [Baltimore].

Frenquel, previously designated as MER-17, is alpha-4-piperidyl diphenyl carbinol hydrochloride. It is the gamma isomer of Meratran. Despite the structural resemblance between the two drugs, pharmacologically their actions are entirely different. Unlike Meratran, which increases activity in laboratory animals and is a stimulant for human beings, Frenquel diminishes spontaneous activity in animals. The authors studied the effects of Frenquel on disturbed patients with a relatively poor prognosis, unlikely to reveal sudden changes, that is, patients with long histories of hospitalization. The average duration from the time of commitment was 17½ years with a range from 2 to 39 years The study began with the clinical evaluation of each patient in accordance with nine criteria. By this method a psychiatric profile of the personality structure was obtained. During the period of the study, rounds were made twice daily to determine any changes in the patients. The drug was given in a dose of 10 mg. twice a day. The observations of attendants were taken into consideration in making evaluations. Neither physicians, attendants, nor patients knew who was and who was not receiving the drug, until after the investigators had committed themselves on the status of each of the patients studied. Twenty-one of the 39 patients exhibited definite improvement. In seven others improvement was doubtful. Eight others remained unchanged and three became worse. The three patients whose symptoms were aggravated all had paranoid reactions, but 12 patients with similar diagnoses showed improvement. The authors feel that the results obtained are sufficiently encouraging to indicate use of this drug in other patients with psychoses.

Low Normal Intelligence and Schizophrenia. C. H. Fellner and P. L. Weil. Am. J. Psychiat. **112**:349-353 (Nov.) 1955 [Baltimore].

After several years of experience with insulin coma therapy on schizophrenic patients, the authors have come to the conclusion that the intelligence level of the schizophrenic patient is of great importance in the prognosis. The present survey is of patients belonging to the lower stratum of what is considered the normal variations of human intelligence. These were dull persons; their I. Q. was between 75 and 85, and the level of their social and scholastic achievements was correspondingly low. Thirty schizophrenic "dullards" were given a full course of insulin coma therapy, combined, in 10 patients, with electroplexy. The results are compared with those of the same treatment in schizophrenic patients of originally average normal intelligence. The great discrepancy between the results achieved in schizophrenic patients of originally average normal intelligence and "dullards" appears to be real, and the authors consider the prognosis very unfavorable in the latter. They doubt that insulin coma therapy is indicated in the schizophrenic patient of low intelligence.

Neuropathic Aspects of Bronchopulmonary Cancer. N. Romano and R. A. Eyherabide. Rev. Asoc. méd. argent. **69**:288-290 (Aug. 15-30) 1955 (In Spanish) [Buenos Aires, Argentina].

Bronchopulmonary cancer metastasizes readily. Frequently it produces metastases in the nervous system, the brain, and the spinal cord. The symptoms are those of intracranial hypertension plus the neurological symptoms, which vary with the location of the metastases, masking the symptoms of bronchopulmonary cancer. The patients complain of dizziness, headache, and pain, which is relieved by roentgen therapy, and sometimes of convulsions and tremor. Hemiplegia and mental deterioration occur in all cases. The cerebral metastases travel by way of the blood and are mainly located in the sylvian territory. Cerebellar metastases are rare and give origin to a typical cerebellar syndrome. A differential diagnosis between primary and metastatic cerebral tumor is feasible from the results of clinical examination of the patient and roentgen examination of the chest. Prior to the appearance of neurological symptoms, all patients pass through an attack of acute bronchopulmonary disease. The roentgenogram of the thorax shows in all cases marked shadows of tumoral pulmonary atelectasis. Intrabronchial tumors originating in the apex of the lung diffuse directly or through the lymph nodes to the upper vertebrae, causing in succession the painful thoracotracheal and apicocostovertebral syndromes and Pardal's syndrome of anginal pain, with medullary compression and destruction of the vertebrae. When the tumor grows in other areas of the lung, the metastases travel by way of the blood, causing medullary compression of the vertebrae in the lower segments of the spine. The authors report four cases. Autopsy confirmed the roentgen diagnosis of cerebral or cerebellar metastases from cancer of the lung in all cases. The histological type of the metastases conformed to that of the pulmonary cancer. The authors emphasize the importance of clinical examination of the respiratory tract and of roentgen examination of the chest in all patients with neurological symptoms or with typical lesions of the nervous system, with the aim of detecting probable presence of cancer of the lung.

GYNECOLOGY & OBSTETRICS

Evaluation of 13,797 Routine Cervical Smears in a Cytology Center. W. S. Rogers, J. E. Ayre and B. Millar. Obst. & Gynec. 6:487-492 (Nov.) 1955 [New York.].

Of 13,797 routine initial smears (made from cervical cell scrapings in almost all the cases), which were sent to a cytological center for examination in the course of one year, 162 (1.2%) were classified as malignant, 43 (0.3%) as atypical or suspicious, and 214 (1.5%) as precancerous. Clinical description of the cervix revealed a suspicion of malignancy or a lesion in only 20.8% of the group with smears classified as malignant, in 22.2% of those with an atypical or suspicious smear, and in 5.5% of those with a precancerous smear. The remaining patients were described as showing inflammatory changes or erosions. The large number of unsuspected cases is significant. Correlation with microscopic findings may be difficult but should be thorough before advising a patient that she needs no further studies. An appeal is made for the routine widespread use of cytodiagnosis as the only present feasible method of control of cancer of the cervix. The ability to detect the precancer cell complex in cervical cell scrapings provides a potent tool in cancer prevention.

Influence of Follicular Hormone on Corpus Carcinoma. H. Husslein and E. Schüller. Arch. Gynäk. 187:20-38 (No. 1) 1955 (In German) [Munich, Germany].

On the basis of a survey of the literature and of 601 cases of carcinoma of the body of the uterus that were observed at the Second University Womens Clinic of Vienna during the years 1925 to 1953, the authors attempt to demonstrate that corpus carcinoma grows more rapidly and appears earlier under the influence of estrogens. The following factors from gynecologic pathology indicate this: (1) the concurrence of cystoglandular hyperplasia and adenocarcinoma in the histological picture; (2) atypical hyperplasia appearing as a precancerous condition and through transitional forms leading to true carcinoma; (3) the chronological sequence of hyperplasia and carcinoma; (4) the increased incidence of corpus carcinoma in connection with ovarian tumors that secrete estrone (follicular hormone); (5) the numerous cases of corpus carcinoma after prolonged treatment with estrogenic substances; and (6) the observation that women with belated menopause and prolonged estrogenic stimulation have a higher incidence of corpus carcinoma. Then there is the observation that corpus carcinoma occurs rarely or not at all after surgical castration, but it does occur after roentgen castration, the latter not completely blocking estrogenic stimulation. Furthermore, corpus carcinoma does not occur during sexual maturity and normal biphasic cycles, and its rare occurrence in young women is usually preceded by prolonged cyclical disturbances, particularly by anovular cycles. Knowledge of the role of estrone in corpus carcinoma should be utilized for the prophylaxis. The prolonged action of estrogen must be avoided even during sexual maturity; it must be interrupted either by progesterone or effectively suppressed by testosterone. Menopausal hyperplasia must be counteracted not only with local measures but also by administration of antagonists. Atypical endometrial hyperplasia must be suspected of being a precancerous condition and should be arrested by large doses of testosterone. Prolonged administration of large doses of estrogens should be avoided particularly during the climacteric and the early menopause; testosterone is to be preferred during this period. If there is a tendency to cancer, the use of estrogenic substances is absolutely contraindicated. If castration becomes necessary it should be accomplished by surgery rather than by roentgen treatment. The function of the liver in the metabolism of estrogenic substances should be supported by the administration of vitamins of the B complex.

Ten Thousand Vaginal Smears in the Private Practice of Gynecology. M. S. Allan. Obst. & Gynec. 6:482-486 (Nov.) 1955 [New York].

Ten thousand examinations (20,000 slides) were made on vaginal smears from 5,949 private gynecologic and obstetric patients in the course of six years. Two slides were collected from every patient, one obtained from the vaginal pool of secretions and one by aspiration from the cervical canal. Of the 5,949 patients, 5,666 (95.2%) had smears that were classified as normal or atypical, 230 (3.9%) had smears that were called suspicious, and 53 (0.9%) had smears that were called positive. Included in the positive classification were 16 patients whose original smears were classified as suspicious. The 246 patients whose smears were suspicious were subjected to repeated examinations, and the 16 whose smears eventually became positive did so within an average time of 10 months; the 16 patients averaged five smear examinations each and most of them were in a younger age group. Pathological confirmation of malignancy was obtained in 45 of the 5,949 patients, and 39 of the 45 had smears classified as positive before the pathological confirmation, an accuracy rate of 86.7%. Five of the other six patients had smears called suspicious; by adding these to the definitely positive smears, an accuracy rate of 97.8% results. Among the patients with proved malignancy, 26 had carcinoma of the cervix, 17 of which were of the early type, and 18 had carcinomas of the endometrium, 7 of which were of the early type; one patient had an ovarian metastasis. Deducting the 45 patients with malignancy from the 5,949 patients under consideration, there remain 5,904 who have no cancer. Smears from 14 of the 5,904 patients were at one time or another called positive; 3 of these 14 patients were lost to follow-up, 5 proved to be false-positive, and 4 continued to have positive or suspicious smears. Twenty-four of the 45 patients with proved malignancy had early carcinoma and only 3 were really advanced cases. Comparison of the readings of cervical smears with those taken from the vagina showed that the cervical smear would have a higher classification in the ratio of 5:1. A strong plea, therefore, is made to incorporate a cervical smear with the vaginal smear in every examination. The author's data suggest that early cancer that had not been detected in any other manner was indicated frequently by the smears and later confirmed by biopsy. Many suspicious smears showing dyskaryosis were found. Patients thus were selected for careful watching because of the likelihood of their developing cancer in the future. Smears proved helpful in the preöperative work-up of gynecologic patients. Smears also provided an added incentive for patients to appear for periodic general and gynecologic examinations. The smear proved to be a simple and effective means of hormone assay. Unsuspected nonmalignant conditions were revealed.

BOOK REVIEWS

Hiroshima Diary: The Journal of a Japanese Physician, August 6-September 30, 1945. By Michihiko Hachiya, M.D., Director, Hiroshima Communications Hospital. Translated and edited by Warner Wells, M.D. Cloth. $3.50. Pp. 238. University of North Carolina Press, Box 510, Chapel Hill, 1955.

"Hiroshima Diary" may become a medical and literary sensation, and it certainly will be widely read. It is better than most best sellers, for it is devoid of the usual literary trickery. Dr. Hachiya has written of the critical days following the dropping of the first atomic bomb on his native city with engaging simplicity and beauty of expression. With him you live every moment, for he speaks as one speaks only to a diary. If you want to know what it is like to live in a house that is bombed and be called on (as you may some day be) to face the medical problems of catastrophe; if you want to see what it is to put your professional skills to the greatest test imaginable; if you want to see how one man faced problems that you, as a physician, should anticipate, then spend a few hours with Dr. Hachiya. He was wounded and barely able to make his way in the semidarkness to his hospital. Of this he writes: "I paused to rest. Gradually things around me came into focus. There were shadowy forms of people, some of whom looked like walking ghosts. Others moved as though in pain, like scarecrows, their arms held out from their bodies with forearms and hands dangling. These people puzzled me until I suddenly realized that they had been burned and were holding their arms out to prevent the painful friction of raw surfaces rubbing together. . . . I saw a naked man, and it occurred to me that, like myself, some strange thing had deprived [him] of [his] clothes. An old woman lay near me with an expression of suffering on her face; but she made no sound. Indeed, one thing was common to everyone I saw—complete silence." Dr. Hachiya takes the reader with him through the six days when, bedridden, he observed the activities of those around him and tried from his wooden pallet to satisfy his curiosity as to just what had hit Hiroshima. This curiosity finally led him to the mosaic-like construction of a theory of irradiation sickness in a fine bit of scientific detective work, and in this sense his book has all the drama and suspense that one finds in the tales of a great sleuth. When his wounds had healed enough for the sutures to be removed, he plunged with vigor into his duties as director of what was left of one of Hiroshima's largest hospitals. What the reader hears of the day-to-day problems of patient care, sanitation, and supply under these conditions is no pedantic recitation of a dull man but a vivid description by a man of warmth, perception, intelligence, and great professional ability. Admirably translated, "Hiroshima Diary" is a graphic picture of the destruction that man can wreak on man. It holds many lessons for the medical profession, and it may be read with profit by every physician and medical student.

The Thyroid: A Fundamental and Clinical Text. Editor: Sidney C. Werner, M.D., Sc.D. (Med.). With 60 contributors. Cloth. $20. Pp. 789, with 130 illustrations. Paul B. Hoeber, Inc. (medical book department of Harper & Brothers), 49 E. 33rd St., New York 16, 1955.

The editor of this volume remarks that the profusion of books on the thyroid requires justification for the introduction of a new one. He believes that the recent growth of medical knowledge in general and of knowledge of the thyroid in particular creates a need for a new volume. He questions whether any one man can completely cover the field of thyroid function and disease. This book is divided into 45 chapters written by 60 contributors, including surgeons, internists, and radiologists. Part 1 deals with the physiology of the thyroid, the thyrotropic secretion of the anterior pituitary, effects of steroids and of stress, the biochemistry of the thyroid hormone, and the comparative and microscopic anatomy of the thyroid. Part 2 covers basal metabolism, serum precipitable iodine, serum cholesterol, radioiodine, and miscellaneous tests. Part 3 discusses embryologic development, surgical anatomy, physical examination, pathology, nontoxic goiter, thyroid cancer, hyperthyroidism, hypothyroidism, and thyroiditis. This is a reference book rather than a textbook, but it contains material of interest to medical students and, in some instances, even to the laity. There is a brief discussion of nuclear physics and the use of radioisotopes that should be of great value to older practitioners who graduated before radioisotopes were discovered. The book is well written. The editor has skillfully woven the numerous contributions together. There is little repetition despite the large number of contributors. This book is a valuable addition to the literature on the thyroid. Its greatest defect is that it has no author index.

Psychiatry for the Family Physician. By C. Knight Aldrich, M.D., Associate Professor of Psychiatry, University of Minnesota Medical School, Minneapolis. Cloth. $5.75. Pp. 276, with 18 illustrations. Blakiston Division, McGraw-Hill Book Company, Inc., 330 W. 42nd St., New York 36; 95 Farringdon St., London, E.C.4, England, 1955.

Despite the many books on psychiatry for the general practitioner, this one fills a real need. It is not a textbook, but it begins with fundamentals and develops a logical basis for understanding of the emotional problems of patients. Enough discussion of dynamics is included to make the text understandable without becoming weighty. It is refreshing to find understanding rather than techniques emphasized in the care of patients with emotional problems. The chapter on treatment is especially good as a broad guide for the handling of these problems. The value of the book would have been enhanced if it had been presented in textbook style to provide the reader with a means of quick access to specific topics. The index makes up in part for this deficiency. There is a useful bibliography. The book can be heartily recommended.

Caring for the Sick Child at Home. By Marion Lowndes. Cloth. $3. Pp. 157. Westminster Press, Witherspoon Building, Philadelphia 7, 1955.

This book was written to help mothers cope with the problems that arise when there is a sick child in the home. It stresses the type of care that an average mother can give and does not attempt to turn the mother into a professional nurse. It points out a multitude of things that can be done in an efficient and practical manner to simplify the care of the child and also to make the situation as simple and relaxing as possible for the mother herself. The suggestions should be particularly valuable for any mother faced with a long-term illness in her child or with a prolonged convalescent period. The chapters cover all phases of care of the sick child in the home, including the following subjects: the sick room itself and the equipment that should be located there; local agencies where the mother may obtain special equipment if needed; substitutions that can be made by the resourceful mother from materials at hand in the home; a sample schedule of activities and care for the patient throughout the day; directions for collection of specimens, temperature taking and bathing; instructions on how to follow the orders of the physician and especially on how to administer the medicaments he prescribes; and sickroom recreation for children of various ages. There is an excellent chapter on contagious diseases, including tabulations containing pertinent information concerning the various communicable diseases, with emphasis on isolation techniques in the home. There is also an informative chapter on accident prevention and one on emergency measures that can be instituted by the mother until the doctor arrives. The author's approach is sensible. The style is fluent, and the book is easy to read. The directions should be easy for the average mother to follow. This book should be of value to any mother with a sick child under her care at home.

These book reviews have been prepared by competent authorities but do not represent the opinions of any medical or other organization unless specifically so stated.

QUERIES AND MINOR NOTES

WATER AND MILK SUPPLIES FOR TRAVELERS

To the Editor:—*A woman and an infant aged 15 months have to travel south of the border for some time. She is worried regarding water, milk supply, and leafy vegetables. I know boiling the water and milk will do the trick, but is there any other method of safeguarding these, and what can be done as regards the leafy vegetables?* *M.D., New York.*

Answer.—It is customary to advise travelers to areas where there is reason to doubt the safety of water and milk supplies to resort to some form of physical or chemical treatment of water and milk. If pasteurized milk is not available one can in many circumstances provide beforehand or obtain locally adequate supplies of canned whole, condensed, evaporated or powdered milk that can then be reconstituted by the addition of boiled water. With regard to water the simplest procedure not involving chemical treatment is to boil all water used for drinking, washing, bathing, brushing the teeth, and laundry. The latter is frequently overlooked, and in some unsanitary areas abroad may be a source for cutaneous or systemic or gastrointestinal infections. For drinking purposes and for the treatment of small quantities of water tetraglycine hydroiodide has been found effective in destroying cysts of Endamoeba histolytica. Such water purification tablets (globaline) are widely used effectively. It is generally not recommended that leafy vegetables such as lettuce, which may be infected by virtue of local unhygienic handling, washing, and storage practices, be consumed at all in the raw state. Commercial vinegar and potassium permanganate are frequently used to wash leafy vegetables in certain tropical areas, but there is no reliable assurance that such treatment will prevent infection.

SURGERY FOLLOWING MYOCARDIAL INFARCTION

To the Editor:—*A man had a moderately severe myocardial infarction. Eight weeks later an appendectomy was performed for an acute gangrenous appendix. He developed ventricular tachycardia nine days postoperatively and died in spite of quinidine therapy. 1. What is the added mortality risk for a patient who requires surgery so soon after a myocardial infarction? 2. In such a patient would it be advisable to give continuous antibiotic therapy, and, if necessary, do elective surgery for appendicitis or appendical abscess at a later date? 3. If immediate surgery is done, what precautions must be taken?* *J. A. Mishkin, M.D., Watertown, N. Y.*

Answer.—Comment is made on the relationship between (1) a moderately severe myocardial infarct, (2) operation for appendicitis, and (3) death. The time interval between the coronary attack and appendicitis was eight weeks and between the operation and death was nine days; these time intervals are important. The nine-day interval indicates that the operation for appendicitis had nothing to do with death. If it were a factor, death would have occurred during or immediately after the operation. This patient developed ventricular tachycardia that, no doubt, was followed by fibrillation. This disturbance in mechanism is the usual cause of death after coronary artery occlusion. The greatest danger from this is in the first few days of a critical 14-day period. Operation should not be done during this period. The risk of operation is high during the first week and tapers off during the second week. Antibiotic therapy should be used and the abscess drained or the appendix removed after this two-week period. Operation is not without danger after this initial period, but, if urgent, it can be done. Inhalation anesthesia should not be used. Spinal anesthesia or local anesthesia are less dangerous. The patient should be placed in the most comfortable position for him to breathe. He should be spared all pain, because pain can produce dangerous reflex responses on the heart. Operation should be done with dexterity. The patient should be in contact with his surroundings and should be calm and cooperative. It is probably not advisable to use a face mask for administration of oxygen. The surgeon should be prepared to defibrillate the heart if death occurs. There is a possibility that the heart can be started to beat again because the death factor is often small and reversible. Elective operations may be done six months after the attack.

INSECTICIDES USED IN TOBACCO RAISING

To the Editor:—*Are there any benzin ring compounds or insecticides employed in the curing of tobacco or the manufacturing of cigarettes? Have cigarettes ever been considered as a possible etiological factor in aplastic anemia?*

S. L. Blum, M.D., Beaumont, Texas.

Answer.—There is no "benzin" ring, but considering hydrocarbons in general it is observed that those that have attracted attention in connection with smoking are the fluids of lighters. Theoretically some benzene could enter lighter fluids. Such substance is an established source of aplastic anemia. Benzene may not be expected to appear in such fluids since there are much better agents, but its homologues, toluene and xylene, might be used to provide luminosity. Arsenic compounds are the archetype of insecticides employed in tobacco raising. Thousands of tons have been so employed. On a smaller scale scores of other insecticides have been introduced. Presently there is no proof that any insecticide in tobacco measurably is harmful to tobacco users, although tobacco growers may have been damaged. One might assume that if arsenic in tobacco contributed to the rising rate of pulmonary cancer, its action would not be limited to cigarette tobaccos, since cigar tobaccos are equally treated with arsenicals and no high frequency of lung cancer has been ascribed to cigar smoking, however other factors such as the inhalation of smoke by cigar smokers as compared with cigarette smokers must be considered.

CARBON DIOXIDE TOXICITY

To the Editor:—*A patient who works in a frozen food refrigerator states that the carbon dioxide content is higher than normal and that it gives him a headache. Is carbon dioxide in concentration of less than 20% considered toxic? If so, what is the maximum allowable concentration? What is the minimum allowable concentration of oxygen for moderate manual labor, such as packing cartons on a truck? Would unpackaged fresh vegetables in a refrigerator emit any toxic gas other than carbon dioxide?*

James N. Dewane, M.D., Evanston, Ill.

Answer.—Carbon dioxide commonly is not regarded as a toxic gas and only as a simple asphyxiant. Still, its affronts to physiological processes are so definite as to make the label of "toxicity" tenable. The maximum allowable concentration level is 0.5% or 5,000 ppm of air. For many years, 5 to 10% of carbon dioxide has been included in oxygen in connection with asphyxiation. Lately this has been condemned (*Brit. M. J.* 1:468 [Feb. 19] 1955). There, it is stated that carbon dioxide at the 15 or 20% level is poisonous. Hunter (Diseases of Occupations, London, English Universities Press, 1955) states: "A proportion [of carbon dioxide] about 1% in the air is considered as directly harmful, though 2%, which was common long ago in the fermenting vats in breweries, produced no symptoms in the workmen employed there. A proportion of 3% suffices to induce dyspnea with slight headache; if the proportion is from 5% to 6%, the dyspnea is pronounced and accompanied by head-

---

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any medical or other organization unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

ache and sweating; a proportion of 10% breathed only for a minute sets up headache, visual disturbances, tinnitus, tremor and loss of consciousness. The victim of carbon dioxide poisoning rapidly becomes unable to stand and passes into coma." Notwithstanding the foregoing, it is observed that all exhaled air contains in excess of 4% carbon dioxide or more than 40,000 ppm of air. When the percentage of oxygen in air, which normally approximates 21% by volume, drops to 12%, danger is involved. While at all times the atmosphere breathed should be maintained close to the normal, it is not known that damage is prospective when the percentage of oxygen is in excess of 16. Apart from trace quantities of such other gases as methane, it is not known that untreated fresh vegetables emit gases other than carbon dioxide and the trace quantities mentioned are unimportant and nontoxic. Extensive data are recorded (Industrial Hygiene and Toxicology, vol. 2, Patty, F. A., editor, New York, Interscience Publishers, Inc., 1949; and Flury, F., and Zernik, F.: Schädliche Gase, Berlin, Germany, Springer-Verlag, 1931).

TOXIC DIFFUSE GOITER

To the Editor:—*A 55-year-old woman on April 29, 1955, gave a one year history of palpitations, loss of weight, intolerance to heat, insomnia, and general hyperactivity. Her temperature was 99 F (37.5 C), pulse rate 124 per minute (irregular), and blood pressure 130/60 mm. Hg. The thyroid gland showed some enlargement especially of the right lobe but also involving the left lobe. The skin was warm and moist, there was a fine tremor of the hands, and there was auricular fibrillation with a heart rate of 124 per minute but with no evidence of congestive heart failure. The basal metabolic rate on May 2, 1955, was +60%, and the white blood cell count was 5,600 per cubic millimeter, with 46% polymorphonuclear neutrophil leukocytes and 50% lymphocytes. She was placed on Tapazole therapy (10 mg. every 8 hours), digitalized with Gitalin, and given vitamins. On June 15, examination of the heart revealed a regular sinus rhythm with occasional extrasystoles and a rate of 100 per minute. On June 29, 1955, the heart rate was 84 per minute and only showed some sinus arrhythmia. The blood pressure was 125/80 mm. Hg. These changes have persisted until the present. She is feeling better, is eating well, and is gaining weight. The fine tremor of the hands has disappeared, and the intolerance to heat has diminished. The basal metabolic rate on July 6, 1955, was +12. The thyroid gland has decreased in size somewhat. She is still taking 30 mg. of Tapazole daily and 0.5 mg. of Gitalin. The white blood cell and differential counts have become normal. Should treatment with Tapazole and Gitalin be continued indefinitely, and, if so, when and how should the Tapazole dosage be decreased in order to arrive at the minimum maintenance dose? Is radioactive iodine a better and more definite treatment for this particular patient? Would you consider surgery in a patient this age with the previous heart findings, and, if so, how would you prepare her for it with Lugol's solution?* *M.D., New York.*

Answer.—It is assumed this patient has toxic diffuse goiter (Grave's disease). The dosage of Tapazole seems to have been a little inadequate. McCullagh at the Cleveland Clinic continues its administration until the basal metabolic rate is slightly below zero, pulse rate is entirely normal, symptoms have completely disappeared, and strength and weight are normal. The antithyroid drug is continued with diminution in dosage for at least a year. If hypothyroidism is caused and a slight reduction in dosage leads to increase of symptoms, suggestive of impending recurrence, the dose is increased and desiccated thyroid given concurrently. A second course is used by some, but others are not enthusiastic about this. Radioactive iodine is a more definitive treatment. About 75% of patients obtain complete and lasting relief on a single dose. The remainder require one or more additional doses. Recurrences are rare. McCullagh has seen only six recurring cases in 1,400 patients. The only complication is hypothyroidism, which occurs in about 10% of the patients treated. Surgery is still a good treatment and may be offered to patients with auricular fibrillation without decompensation. Most surgeons prefer patients to be treated with 1 ml. of Lugol's solution given three times a day for three weeks prior to operation. Antithyroid drugs are usually withdrawn two weeks before operation.

USE OF HEPARIN FOLLOWING THROMBOSIS

To the Editor:—*Which is the most satisfactory type of heparin (depo-heparin or sodium heparin) for use during the first few days of phlebothrombosis or acute myocardial infarction until dicumarol effect begins? Please summarize the status of sodium heparin in regard to dosage, route of administration, and frequency of coagulation time determinations necessary for adequate control. Is the subcutaneous and intramuscular administration of sodium heparin recommended?* *M.D., West Virginia.*

Answer.—The most satisfactory preparation is aqueous sodium heparin. Repository heparin has given inconsistent results that make it hard to maintain thrombostasis in the desired range; however, it is more convenient. When it is used, it may be given subcutaneously in the anterior thigh in doses of 200 mg. for patients under 150 lb. (68 kg.) and 300 mg. for heavier patients. Clotting times are measured every 12 hours, and the dosage is adjusted correspondingly. The most reliable method is to give aqueous heparin intravenously. Aqueous heparin is supplied in 10 ml. vials containing 50 mg. of heparin and in concentrated preparations containing 50 to 100 mg. per milliliter. The latter are for intramuscular use and, so used, yield more predictable curves of clotting time than the depo-heparin preparations. For intravenous treatment, a Lee-White clotting time is done in duplicate; it is normally 5 to 12 minutes; the first dose is then given, 50 mg. for patients weighing less than 150 lb. and 75 mg. for heavier patients. Clotting time is measured at one hour, when it is usually 50 to 75 minutes. This checks hyposensitivity or hypersensitivity. It is measured again at three and four hours. If the clotting time is normal, the dose is increased. It is usually normal at four hours, or nearly so, in which case the set dosage is repeated every four hours. If clotting is delayed at four hours, the measurement is repeated at six hours or until it falls to normal and the second dose given whenever this recovery has occurred and at like intervals thereafter, with spot checks of clotting time once or twice daily thereafter before a dose. Sodium heparin for intramuscular use is given in an initial dose intramuscularly or subcutaneously of 50 or 100 mg. The clotting times are done every hour for four hours to determine a set schedule, which is usually 50 mg. every three or four hours, with clotting times measured twice daily at three hours after the last dose. For rapid onset of action by this technique, give 50 mg. intravenously and 50 mg. intramuscularly and follow as just described.

CANDIDA INFECTIONS

To the Editor:—*A patient has been bothered with subungual fungous infections for a long time. No acid-fast organisms have been demonstrated, but sputum has been high in Candida albicans and intestinal moniliasis is present. He has had a long vigorous course of iodides, and, while the external picture seems to have improved and the intestinal symptoms have abated some, the sputum is still abundant in Candida. He has now developed intermittent swollen joints with redness and tenderness—all mild, but recurrent with activity. Sedimentation rate is high; no cardiac picture; no rheumatic history. He responds to rest; temporarily. 1. Is the joint picture associated with moniliasis? 2. Could it be associated with iodide therapy? 3. What is being used, further, for pulmonary and intestinal moniliasis?* *M.D., New York.*

Answer.—A new antibiotic preparation, Mycostatin, has been reported to be remarkably effective in systemic monilial infections. It can be given intravenously. Iodides, while effective in blastomycosis and torulosis, have no effect on moniliasis whatsoever. The disease of the joints could be a toxic manifestation of general moniliasis but could also represent a drug reaction to iodides. In the latter case it should subside when the blood and urine are free of iodides. If iodides are still circulating in the blood, 3 to 4 gm. of sodium chloride should be given daily by mouth to accelerate elimination.

MYOCARDIAL INFARCTION AND WORKMEN'S COMPENSATION

To the Editor:—*In the Queries and Minor Notes section in* The Journal, *Oct. 15, 1955, page 737, the following question regarding workmen's compensation was submitted: "What is the consensus regarding the relationship of effort in myocardial infarction, with reference to the Workmen's Compensation Act?" The reply is a fair statement of conditions existing at present. However, the last sentence of the reply states that "since the tendency is to give the workingman every 'break' his case would probably be judged compensable no matter what is the physician's opinion as to the relationship of physical exertion and myocardial infarction." This statement is without any basis in fact. All referees' decisions in such cases are based on medical evidence, and, unless there is such medical evidence giving causal relationship, no arbitrary ruling would be made giving the claimant the so-called break. Where physicians of equal experience and repute disagree and the evidence submitted is in conflict, then quite properly causal relationship is found for the claimant. There must however always be medical evidence presented claiming causal relationship before a finding of such relationship is made.*

Angela R. Parisi

New York 13.

FEEDING PROBLEM CHILD

To the Editor:—*I would like to comment on the consultant's answer to "Feeding Problem Child,"* The Journal, *Oct. 15, 1955, page 737. I agree that the "problem is more to treat the parents than the child." I agree that a complete change of tactics in the family may help in such situations, but the last sentence negates the whole spirit of the consultant's answer. Hospitalization of a child such as the one described cannot be too strongly condemned. True, the child might start eating, but at what cost? The essence of the problem stated lies in the parent-child relationship, and a traumatic separation (traumatic for both parent and child) may cure the symptom but is bound to aggravate the basic disease. Why not counsel with the parents and allow them to express their own ideas and feelings and to work with the doctor on how they got into this mess and what they can do to get out of it. This approach will "treat the parents" and possibly help them to avoid future pitfalls. The inquirer should be referred to Aldrich's "Feeding Our Old Fashioned Children" (New York, the Macmillan Company, 1941), Senn's book on feeding children (All About Feeding Children, New York, Doubleday & Company, 1944), and Spock's section on the preschool child (The Common Sense Book of Baby and Child Care, New York, Duell, Sloane, & Pearce, Inc., 1946).*

ULTRASONIC THERAPY

To the Editor:—*In the Queries and Minor Notes Section in* The Journal, *Oct. 8, 1955, page 633, is an answer on the use of ultrasonic therapy for bronchial asthma. I should like to echo the sentiments of the consultant and relate my experience with one case. A 46-year-old man with a history of asthma and hay fever, well controlled by allergic management, developed a severe, acute attack of allergic rhinitis (hay fever) and bronchial asthma about two hours after receiving ultrasonic treatment to the chest. This attack lasted 36 hours. The exact mechanism of such a reaction I do not know, but it does show what may happen to a potential asthmatic patient from ultrasonic therapy to the lungs.*

TUBERCULOSIS OF KIDNEY

To the Editor:—*May we take exception to the comment in answer to the query on "Tuberculosis of Kidney" in* The Journal, *Sept. 10, page 153, that there is no special advantage in using the potassium salt (of aminosalicylic acid) except to desensitize and to restrict sodium intake? In our article* (Am. Rev. Tuberc. 71:*220, 1955), we pointed out that the chief advantage of the potassium salt of aminosalicylic acid was its tolerability and "patient-acceptance," including freedom from nausea. Of 38 patients deliberately solicited because of intolerance to other aminosalicylate compounds (namely, aminosalicylic acid and sodium aminosalicylate), only 3 were unable to take potassium aminosalicylate in 12 gm. daily doses for prolonged periods. An additional 21 patients who had received no previous aminosalicylic acid therapy were also able to tolerate the potassium aminosalicylate in full dosage. Our more recent data, which cover an 18-month period from the time potassium aminosalicylate was first used, give a total of 120 patients treated. Of these, 78 were intolerant to other forms of aminosalicylic acid and only 5 in this group could not take potassium aminosalicylate consistently in 12 gm. daily doses. The remaining 42 patients (no previous potassium aminosalicylate therapy) had no difficulty in taking the drug. A similar drug tolerance study was performed independently by Chernish and Peck (An Evaluation of Potassium Para-Aminosalicylate,* Antibiotic Med. 1:*377 [July] 1955). These authors, using potassium aminosalicylate in capsule form, reported an intolerance rate of only 6% in a group of 102 patients, again, intolerance to potassium aminosalicylate occurring in those patients who were intolerant to all other forms of aminosalicylic acid. The over-all tolerance rate of 95% for potassium aminosalicylate certainly is far superior to tolerance rates for other aminosalicylate preparations. As a result of such data, we feel that the very high degree of patient tolerance and acceptance is a distinct advantage of potassium aminosalicylate therapy. As another advantage of potassium aminosalicylate may we cite the study of plasma aminosalicylate concentrations following the administration of potassium aminosalicylic, sodium aminosalicylic, and aminosalicylic acid. The potassium salt produced higher plasma concentrations than did the other two compounds when all three drugs were tested in each of eight subjects. These results were duplicated by Chernish and Peck. With reference to the patient mentioned in the query, we feel that if his vomiting is secondary to aminosalicylate medication, this symptom might well be relieved by the substitution of potassium aminosalicylic for the aminosalicylic acid he is receiving. If however, the vomiting is secondary to renal disease, potassium aminosalicylate would not improve the situation.*

EATING ACTIVE YEAST DAILY

To the Editor:—*I would like to offer the following observation after reading a query in* The Journal, *Oct. 8, 1955, page 633. A patient was afflicted with micrococcic (staphylococcic) infections of the thumb from 1929 to 1938. Then he quit smoking and ceased having thumb infections but had boils, sometimes as large as hen's eggs on other locations. A special eight-hour sugar tolerance test showed a higher curve than normal. A diet for diabetics prevented the boils but reduced body weight. It was necessary to use insulin, sulfonamides, or antibiotics to prevent or cure the boils on a normal diet. Since the thesis of Robert Houston Hamilton Jr. (Minneapolis, University of Minnesota, 1933) showed that active yeast lowered the blood sugar, the patient has eaten active dry yeast for the last five years daily along with a normal diet and has had neither boils nor vitamin B (thiamine) deficiency.*

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT, SEPTEMBER-DECEMBER 1955

Abstracts have been made of important articles in the following journals in the Current Medical Literature Department of THE JOURNAL during the past four months. Any of the journals, except those starred, will be lent by the Library of the American Medical Association to individuals in Continental United States and Canada who subscribe to its scientific periodicals and to members of the American Medical Association and its student organization. No charge is made to members, but the fee for other borrowers is 15 cents in stamps for each periodical. Three journals may be borrowed at a time for a period not exceeding five days. Thus most of these journals are accessible to the general practitioner.

SUBJECT INDEX

The letters used to explain in which department the matter indexed appears are as follows: "E," Editorial; "C," Correspondence; "ab," abstracts; the asterisk (*) indicates an original article in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word with the following exceptions: Foundations, Lectures, Moving Pictures, and Prizes, under "F," "L," "M," and "P" respectively. "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For the author index see page 46.

A

- ACTH: See Corticotropin
- APC VIRUS: See Adenoidal-Pharyngeal-Conjunctival Virus
- ABDOMEN
  - acute disease differentiated from extra-abdominal, Peru, 706
  - acute in partial intraligamentary extrauterine pregnancy, [Best] 1161—ab
  - acute, serum amylase test in, [Gilbert] *775
  - anterior wall, Paragonimus westermani infestation in, [Kay] *1731
  - distended in chyliform pleurisy, Turkey, 1147
  - pain in fatal liver cirrhosis, (diagnostic problem) [Kidd] *1739; (comment) [Boggs] *1741
  - pain (lower) in dysmenorrhea in adolescence, 829; (correction) 1557
  - surgery, laparotomy; premedication: chlorpromazine, [Oljelund] 632—ab
  - symptoms after cholecystectomy, [Sandweiss & Fulton] *998
  - symptoms in untreated obese diabetic woman, 233
  - tumor, massive pheochromocytoma, [Colcock] 1159—ab
  - wall; tantalum, steel wire or nylon mesh to repair, [Petrina] 1798—ab
- ABNORMALITIES
  - after rubella during gestation, [Clément] 1067—ab; [Brawner] 1245—ab
  - as cause of perinatal mortality, [Gold] *241
  - peromelus with no distal parts, Switzerland, 510
- ABORTION
  - carbon monoxide poisoning cause? 1172
  - criminal, vaginal burns from potassium permanganate, [St. Romain] 406—ab
  - in etiology of cerebral palsy, [Denhoff] 719—ab
  - law, suggest changes, England, 1475
  - threatening and, vaginal and urinary cytology in, [Gagliardi] 85—ab
- ABRASION, Therapeutic: See Planing
- ABSCESS
  - abdominal, Paragonimus westermani infestation in, [Kay] *1734
  - cold, heparin for, France, 1325
  - of epiglottis, diagnosis, [Ralm & others] *1289
  - of pituitary in diabetes, Houssay phenomenon, [Brenner] 1152—ab
  - paravertebral, evacuation plus curettage of vertebral bodies in spine tuberculosis, [Wilkinson] 1242—ab
  - typhoid infection in, 1314
- ACCIDENTS
  - Automobile: See Automobiles
  - catastrophic, Metropolitan Life Insurance Co. report, 200
  - in children after cortisone, France, 703
  - in children; preventing, especially with kerosene, [Carithers] *109
  - in schools, England, 701
  - in the home, N. Z., 1565
  - Industrial: See Industrial Accidents
  - "is there a doctor . . .?" [Gordon] *1402
  - national service for, appeal for, England, 1564
  - skin diving problem, [Burns] *5
- ACETAZOLAMIDE
  - treatment of cardiac edema in arteriosclerosis, Denmark, 503
  - treatment of glaucoma, Norway, 1399
  - water removal in liver cirrhosis with, [Rissel] 821—ab
- ACETRIZOATE, SODIUM
  - for thoracic aortography, [Pender & others] *1738
- ACETYL SULFISOXAZOLE
  - tests and standards, 1120
- N-ACETYL-*p*-AMINOPHENOL
  - treatment of rheumatism compared to salicylamide, [Batterman & Grossman] *1619
- 3-ACETYL-AMINO-2-4-6-TRIIODOBENZOATE, SODIUM
  - angiography using, France, 703
- ACETYLSALICYLIC ACID (Aspirin)
  - effect on peptic ulcer, [Muir] 714—ab
  - toxicity, therapy for, [Schreiner] 711—ab
  - treatment vs. cortisone in chronic rheumatism, England, 1047; [Cohen] 1238—ab
  - vs. salicylamide as analgesic and antirheumatic agent, [Batterman & Grossman] *1619
- ACHROMYCIN: See Tetracycline
- ACID: See under name of specific acid as Acetylsalicylic Acid
- ACIDOSIS
  - ketoacidosis, managing diabetes during, [Goodman] *831
- ACNE
  - rotary abrasion for scars, [Eller] 726—ab; (A.M.A. Committee report) [Rattner & Rein] *1299; 1303—E
  - severe, with chronic hepatitis, 1335
  - vulgaris, (A.M.A. Committee report) [Malkinson] *1117; (guest editorial by Dr. Rothman) 1121; (reply: specialist vs. general practitioner) [Mecklin] 1676—C
- ACROMEGALY
  - thyrotoxicosis with, [Heaney] 626—ab
  - in Troell-Junet syndrome, Switzerland, 623
- ACROSCLEROSIS
  - form of generalized scleroderma, x-ray study, [Leszler] 1250—ab
- ACTAVIS
  - treatment of asthma crisis, [Rosa] 72—ab
- AD HOC Committee on Internships, report, *255; 932
- ADAMS-Stokes Syndrome: See Heart, block
- ADDISON'S DISEASE
  - glucagon hyperglycemic response in, [Alivisatos & McCullagh] *1098; (correction) 1467
  - treatment, fludrocortisone, [de Gennes] 1418—ab; (plus hydrocortisone) [Kupperman & Epstein] *1447; [Hamwi & Goldberg] *1598
  - treatment in man 60, 1580
  - treatment, survival over 15 years, [Rowntree] *1527
- ADENOCARCINOMA
  - of endometrium, prognosis and therapy, [Webb] 522—ab
  - of kidney, [Briggs] 1331—ab
- ADENOIDAL-PHARYNGEAL-CONJUNCTIVAL VIRUS
  - (England) 1233; (Canada) 1788
  - vaccine studies, [Huebner & others] *986
- ADENOIDECTOMY
  - complications: epistaxis and hemorrhage, estrogens for, [Menger] *546; [Gertner] 1401—C
- ADENOMA
  - of parathyroid, [Lee] 1571—ab
  - sebaceum; sebaceous involvement doubtful, [Zeligman & Scalia] 708—C
- ADENOMYOMA
  - gastric adenomyosis vs. aberrant pancreas, [Cimmino] 731—ab
- ADENOSINETRIPHOSPHORIC ACID
  - treatment of progressive spinal muscular atrophy? 152
  - treatment plus ACTH and ascorbic acid in asthma crises, [Rosa] 72—ab
- ADIPOSITY: See Obesity
- ADOLESCENCE
  - dysmenorrhea with low abdominal pain in, 829; (correction) 1557
  - thyroid cancer in, after irradiation, [Clark] *1007
- ADRENALIN: See Epinephrine
- ADRENALS: See also Addison's Disease; Cushing's Syndrome
  - adrenogenital syndrome in children, cortisone to diagnose and treat, [Andersen] 1070—ab
  - cortex activity measured by eosinophils, [Hoffer] 1496—ab
  - cortex and diabetes, Switzerland, 1566
  - cortex dysfunction, menstrual disturbances as sign, Austria, 1473
  - cortex hyperfunction, cortisone test in, [Gilsanz] 715—ab
  - cortex preparations in adrenal hypofunction, [Rowntree] *1527
  - dysfunction cause face and trunk pigmentation in chronic lung disease? 737
  - insufficiency after hypophysectomy, (reply) [Mellinger] 738
  - steroids in infectious disease, [Spink] 1569—ab
  - surgery, adrenalectomy and oophorectomy for breast cancer, [Girdwood] 81—ab; [Galante] 716—ab
  - surgery, adrenalectomy (bilateral total) for degenerative vascular disease in diabetics, [Headstream] 726—ab
  - surgery, adrenalectomy for breast cancer, [Dao] 1690—ab; [Pearson & others] *1701
- ADRENALS—Continued
  - surgery, adrenalectomy for hypertension, [Yeager] 223—ab
  - surgery, adrenalectomy; metabolic response, [Graber] 1242—ab; [Mason] 1413—ab
  - surgery, adrenalectomy (subtotal) plus sympathectomy and splanchnicectomy for hypertension, [Cartier] 814—ab
  - surgery, fludrocortisone after, [Hamwi & Goldberg] *1598
  - tumors, pheochromocytoma (malignant) with metastases, [Davis] 971—ab
  - tumors, pheochromocytoma (masked), diagnosis, [Mandl] 81—ab
  - tumors, pheochromocytoma, phentolamine in diagnosis and management, [Helps] 970—ab
- ADRENOCORTICOTROPIC HORMONE: See Corticotropin
- ADVERTISING
  - A.M.A. Council on Foods and Nutrition, new program, *779
  - by drug house through the mail, England, 66
  - of physician's office in lobby ethical? 686
- ADVISORY
  - Board for Medical Specialties, approved boards, *441
- AEROPLAST: See Vibesate
- AEROSOLS
  - detergents, drowning not possible from, (reply) [Miller] 738
  - irritation from, in antibiotic mists, (reply) [Miller] 738
- AGAMMAGLOBULINEMIA: See Blood
- AGE
  - in coronary artery disease, [Peel] 710—ab; (England) 1046
- AGGLUTININS
  - isoagglutinins, A, B, O, and AB groups in thrombocytes, Israel, 704
- AGRANULOCYTOSIS
  - deaths in Netherlands from, [Salomonson] 821—ab
- AGRICULTURE
  - A.M.A. sponsors symposium on health hazards of chemicals in, 38
  - atomic energy and, symposium, 1779
- AIR
  - carbon disulfide in, request lower standard, [Kleinfeld & Tabershaw] *677
  - embolism from skin diving, [Burns] *5
  - filters for pollen asthma, 1579
  - myelography, cervical, [Murtagh] 822—ab
  - polluted, relation to lung cancer, England, 1323; (relation to smoking) [Stocks] 1679—ab
  - pollution, California Conference on, 1034
  - pollution, Clean Air Bill; general approval, England, 966
  - pollution, USPHS research grants, 796
- AIRPLANES: See Aviation
- ALBUMIN: See Blood proteins; Radio-Iodinated Serum Albumin
- ALBUMINURIA
  - nephritis without, [Czoniczer] 1486—ab
- ALCOHOL
  - consumption, (Sweden) 67; (Belgium, laws on) 139
  - in blood, determining, Belgium, 139
  - National Research Council grants-in-aid, 1470
- ALCOHOLISM: See also "Drunkenness" under Medicolegal Abstracts at end of letter M
  - acute, chlorpromazine in, [Schultz] 406—ab
  - acute, treatment, Sweden, 67
  - A.M.A. Committee report, 918
  - Chicago industry community conference, 955
  - chronic, presenile cerebellar ataxia in, [Skillicorn] 816—ab
  - cost and time of hospital treatment, England, 1674
  - delirium tremens, France, 1325
  - delirium tremens, reserpine for, [Avol & Vogel] *1516
  - morphine contraindicated in, [Naalsund] 727—ab
  - treatment, antabuse unfavorably affect peptic ulcer? 1174
- ALDOSTERONE (Electrocortine)
  - hyperaldosteronuria after surgery, [Llaurado] 225—ab
  - hyperaldosteronuria with sodium retention; edema from, Switzerland, 212
  - postoperative aldosteronism, N. Z., 705

ALEVAIRE
  no irritation from, (reply) [Miller] 738
ALIMENTARY TRACT: See Gastrointestinal Tract
ALKALI
  needless dosing of infants with, England, 804
  treatment of allergic shock, [Clark] 1795—ab
ALLERGY
  alkali for shock of, [Clark] 1795—ab
  autoerythrocyte sensitization, purpura with painful bruising, [Gardner] 712—ab
  eczema problem, [Bookman] *1275
  erythematous patches and hives, etiology; treatment, 1255
  favism, [Bolt] 402—ab
  hazard of diagnosis and therapy, [Barr] *1452
  heparin, [Massone] 1249—ab
  horse serum during pregnancy, cortisone deleterious? 634
  insulin (lente) reactions fewer, [Haunz] *1611
  International College of Allergists report, 622
  patent leather shoes, bullous lesions from, 736
  penicillin anaphylaxis, [Crúz Hernández] 1248—ab; (fatal) [Andersen] 1680—ab
  penicillin, desensitization problems, England, 1143
  penicillin, feasibility of skin test, [Berger & Eisen] *191; (replies) [Coleman] 1148—C; [Siegal] 1401—C
  penicillin, from occasional course? 1336
  penicillin, in workers producing it, [Maffei] 731—ab
  penicillin reactions prevented by chlorprophenpyridamine maleate, [Frankel] 1408—ab
  photoallergic eczema, Switzerland, 212

  government proposes sociomedical insurance for employees, 1145
  psychiatric journeys (2nd), 509; (schizophrenia and apoplexy symposia) 1476
PETHIDINE: See Meperidine
PETROLATUM
  liquid, lipoid pneumonia from, [Meyers] 150—ab
PEYRONIE'S *Disease*: See Penis
PHARMACEUTICALS: See Drug
PHARYNX
  tumors, fibroma, [Christiansen] 1417—ab
PHEMEROL CHLORIDE: See Benzethonium Chloride
PHENACEMIDE
  toxicity fatal in epilepsy, [Craddock] *1437
PHENINDIONE
  treatment of acute myocardial infarction, [Breneman] 72—ab
  treatment of coronary thrombosis with myocardial infarction, [Wood & others] *635
PHENOBARBITAL
  treatment plus, Dilantin in epilepsy, blood cell count after, (reply) [Peterman] 980
PHENOXYBENZAMINE
  treatment plus Rauwolfia in hypertension, [Moyer] 220—ab; (plus protoveratrine) [Waldron] 1794—ab
PHENTOLAMINE
  in diagnosis and management of pheochromocytoma, *[Helps] 970—ab*
PHENURONE: See Phenacemide
PHENYLALANINE
  metabolism in phenylpyruvic oligophrenia, *[Ferrari] 1160—ab*
PHENYLBUTAZONE
  toxicity, [Mauer] 1248—ab
  toxicity: anuria fatal, [Toussaint] 526—ab
  toxicity: hepatic necrosis and visceral lesions, [McCarthy] 729—ab
  treatment plus aminopyrine in gout, [Koller] 821—ab
  treatment plus aminopyrine in rheumatic fever; side-effects, [Falk] 149—ab
2-PHENYLCHROMONE
  coronary dilator, [Ferrari] 408—ab
PHENYLETHYLACETIC ACID
  antiatherogenous? [Cottet] 514—ab
PHENYL-ETHYL-METHYL-HYDANTOIN
  dumping syndrome blockade with, [Dyk] 74—ab
PHENYLINDANDIONE: See Phenindione
PHENYL-PIPERIDYL-2-ACETIC ACID METHYL ESTER
  treatment plus Serpasil in hypertension, [Esseilier] 1071—ab
3-(1-PHENYLPROPYL)-4-HYDROXYCOUMARIN
  thromboembolism prevented with, [von Brandis] 79—ab; [Röttger] 523—ab
  treatment, prothrombin-proconvertin activity in, [Iversen] 820—ab
PHENYTOIN: See Diphenylhydantoin Sodium
PHEOCHROMOCYTOMA
  diagnosis and treatment with phentolamine, [Helps] 970—ab
  malignant, with metastases, [Davis] 971—ab
  masked, diagnosis, [Mandl] 81—ab
  massive abdominal, [Colcock] 1159—ab
PHLEBITIS
  during menstruation, Turkey, 968
  of legs, new sign, [Ortiz-Ramirez] 1060—ab
  748 cases, [Byrne] 1408—ab
PHLEBOTOMY: See Venesection
PHOSPHATASE
  serum acid, tests, [Ozar] 726—ab
PHOSPHORUS
  diet low in for phosphocalcic urinary lithiasis, [Génot] 525—ab
  radioactive, for giant follicular lymphoma, [Desgrez] 529—ab
  radioactive, for polycythemia vera, (England) 393; (effect on platelet count) [Tubiana] *529—ab*
PHOTOGRAPHY
  in operating rooms with electronic flash attachment? 152
PHYSICAL EXAMINATION
  periodic, appraisal, [Bolt] 1493—ab
PHYSICAL MEDICINE
  doctor of, as diagnostician, [Blau] *554
  importance of diagnostic methods in, [Schmidt] *1175
PHYSICAL THERAPY
  schools for, *604

PHYSICIANS
as health officers, Sweden, 1326
avocations, art show, Calif., 1463
avocations, doctors on the screen, (Leisure Corner) [Spears] *1402
avocations, medical poetry, [Leisure Corner] *512

income, 1929-1953, 36—E; (Bureau article) [Dickinson & Raymond] *41; *119
industrial, education for, 1742—E
"is there a doctor . . . ?" [Gordon] *1402
Italian, in U. S.; request information on [Galdston] 1676—C
legal responsibility in hospitals, England, 1231
liability insurance, A.M.A. report, 1657
N.H.S. inspection of premises, England, 803; 1397
night emergency calls, [Public Relations] *486
of Iowa, A.M.A. resolution commending, 1766
on Queen's Birthday Honor List, England, 66
patient relationship, [Public Relations] *1382
placement, Sears-Roebuck Foundation assistance, 37—E; 38; [Business Practice] *1481
Placement Service, A.M.A. report, 937
pocket medical kit, [Barnett] *1451
Polish, studies in Switzerland, 511
practicing, family physician in preventive psychiatry, [Braceland] *1187
practicing, general practitioner and discharged mental patient, [Appel & Scheflen] *1278
practicing, General Practitioner's Award to E. R. Samuel, 1459—E; 1642; 1644
practicing, general practitioners' graduate programs, *599
practicing, general practitioner hospitals, A.M.A. resolutions on recognizing, 1767
practicing, general practitioner hospitals, Ireland, 1563
practicing, general practitioners' right to work in hospitals, England, 66
practicing in physical medicine, as diagnosticians, [Blau] *554
practicing, sick and disabled; Dr. Adolph Gehrmann's fund to aid, 128
practicing, specialist vs. general practitioner for acne, guest editorial by Dr. Rothman, 1124—E; (reply) [Mecklin] 1676—C
public attitudes about, [Public Relations] *686
public health, in occupational health problems, [Warren] *1581
public relation problems, (Public Relations) [Askey] *1551
reimburse colleague for personal medical care from health insurance? 686
responsibility to medical organizations, [Fox] *544
role in encouraging traffic safety, [Public Relations] *487
role in premarital advice, [Greenhill] 398—C
role in preventing poisoning in childhood, [Carithers] *109; (Council report) [Arena] *1537
role in vaccination for travel, 852—E; [Miller] 1478—C
schools and, A.M.A. sponsors conference on, 611; 1125—E; 1126
separated from military service, survey, (Council article) 1306
services, totality of, A.M.A. report, 924
should he report suspected criminal poisoning? 1499
social planners relation to, [Knutson] *1054
social security coverage, A.M.A. reports, 1302—E; 1650; 1656; (President Hess' page) 1744
staff, interpret electrocardiograms of their own patients? 684
strike against proposed general social security, Austria, 800; 1045
unemployment, England, 1790
veteran, propose town of prefabricated houses for retiring doctors, [Peters] 398—C
veteran, retirement association, Calif., 1553
widows and children, survivorship benefits, 1636—E
women, marriage-career views, 1134
PHYSICS
medical, propose A.M.A. Council on, 1651
PICNICKERY: a science, [Leisure Corner] *71
PIGMENTATION
cause of, in face and trunk in chronic lung disease [illegible]
PINWORM Infection: See Oxyuriasis
PIPERAT Tartrate: See Piperazine Tartrate
PIPERAZINE ADIPATE
treatment of ascariasis in children, [Hanna] 976—ab
PIPERAZINE CITRATE
N.N.R., 194
treatment of enterobiasis, [Sappenfield] 727 —ab
PIPERAZINE HYDRATE
treatment of ascariasis, [Brown] 1575—ab
PIPERAZINE TARTRATE
N.N.R., 194
PITRESSIN: See Vasopressin Injection
PITUITARY
apoplexy, surgery for amblyopia in, [Shenkin] *1622
changes in cryptorchism, N. Z., 396
hypopituitarism with hyperlipemia and xanthomas, [Zöllner] 819—ab
in Houssay phenomenon, 1124—E; [Brenner] 1152—ab
surgery, hypophysectomy for cancer; adrenal insufficiency after, (reply) [Mellinger] 738
surgery, hypophysectomy for malignant edematous exophthalmos, [Albeaux-Fernet] 1695 —ab
surgery, hypophysectomy for metastatic breast cancer, [Pearson & others] *1701
surgery, hypophysectomy for severe diabetes, England, 803; [Luft] 1243—ab; 1324
surgery, hypophysectomy; metabolic response, [Mason] 1413—ab
surgery, hypophysectomy; thyroid function after, [Li] 1409—ab
tumors, giant; psychological changes with, [White] 1413—ab
PLACEBO
definitions; indications, 780—E
drug appraisal; use of double-blind control, [Ross] 624—C; 780—E
in evaluating Metamine in angina pectoris, [Fuller & Kassel] *1708
in evaluating salicylamide, [Batterman & Grossman] *1619
in multiple sclerosis, [Tschabitscher] 144—ab
powerful, [Beecher] *1602
PLACEMENT: See Physicians
PLACENTA
conditions as cause of perinatal death, [Gold] *244
implantation, Filatow method, [Holkup] 1068 —ab
previa accreta, 2 cases, Turkey, 806
therapy in seborrhea sicca and eczema of nursling, [Santyan y Velasco] 1416—ab
therapy in skin diseases and old age, Italy, 1144
tumors, hydatiform mole care after dilatation and curettage, 736
tumors, syncytioma malignum, Turkey, 1148
PLANING
rotary abrasion to remove acne scars and other defects, [Eller] 726—ab; (A.M.A. Committee report) [Rattner & Rein] *1299; 1303—E
PLANNED PARENTHOOD *Federation of America* role in premarital advice, [Greenhill] 398—C
PLASMA
of inhabitants of high altitudes stimulates erythropoiesis, Peru, 1146
PLASTICS
in arterial prostheses, [Poth] 1573—ab
Ivalon prosthesis in breast and soft tissue surgery, [Pangman] 818—ab
PLEURA
empyema complicating prolonged use of cortisone in arthritis, 410
fluid cytology, [Childers] 1696—ab
PLEURISY
chyliform, Turkey, 1147
parapneumothorax, hydrocortisone for, [Sartori] 1167—ab
tuberculous, with effusion, [Myers] 811—ab
PNEUMONECTOMY: See Lungs surgery
PNEUMONIA
congenital, [Schaffer] 145—ab; [Schaffer & others] *663
interstitial plasma cell, in premature infants, [Laursen] 1246—ab
lipoid, from mineral oil, [Meyers] 150—ab
treatment, tetracycline, [Bakir] 1678—ab
unspecific, differentiated from bronchial carcinoma, [Kesztele] 515—ab
uremic pneumonitis, mechansim, 1700
PNEUMONOCONIOSIS
asbestosis and bronchial cancer, Switzerland, 1050
bilateral, with emphysema and dyspnea, 1500

SUCTION
  for pyloric channel ulcer, [Ruffin & others] *668
  stomach tube combining feeding, [Frankel] 1052—C

SUICIDE
  attempt with aspirin, [Schreiner] 711—ab
  high in Hampstead, England, 508
  juvenile, England, 1396
N_1-SULFANILYL-N_2-n-BUTYLCARBAMIDE
  antidiabetic sulfonamide, [Franke; Bertram] 1328—ab
SULFATHIAZOLE
  a dangerous drug? 736
SULFONAMIDES
  penicillin and, sensitivity; prevent rheumatic fever with tetracycline, 633
  prophylaxis of rheumatic fever compared to benzathine penicillin, [McCue] 1416—ab
  toxicity; allergic reactions, [Lowell] 1070—ab
  toxicity: amblyopia, [Taub] 1695—ab
  treatment of bacterial infections, (England) 141; 1458—E
  treatment of purulent meningitis, [Etteldorf] *746
  treatment plus penicillin, [Nissel] 1682—ab
  treatment, standing order of combining sodium bicarbonate, (reply) [Carey] 830
SUMMER
  ulcerations in livedo reticularis, [Feldaker] 228—ab
SUPERSONICS: See Ultrasonics
SUPRARENALS: See Adrenals
SURGEONS
  International College, 20th anniversary, 67
  U. S., confer with Israel physicians, 705
SURGERY
  ACTH, cortisone, and hydrocortisone in, [Abbott] 1572—ab
  advances in Norway, 1675
  basic sciences in approved residency, (Council article) 378—E; *382
  cholangiography during, [Gifford] 1489—ab
  diabetes management during, [Goodman] *831
  erythrocyte survival in transfused blood before and after, [Cortese] 1061—ab
  foggy glasses, prevention: antifog preparation, [Smith] 969—C
  gastrointestinal ulcers after, [de Ruiter] 1159—ab
  gynecologic, appendectomy during, Sweden, 1326
  gynecologic, thrombosis and embolism after, [Röttger; Soergel] 523—ab
  homotransplantation, medicolegal aspects, (Medicine and the Law) [Vestal & others] *487
  homovital transplantation in agammaglobulinemia, [Varco] 1242—ab
  hypothermia in, [Swan] 1242—ab
  International Society of Plastic Surgery founded, 959
  Nebacetin in, [Holzhausen] 1798—ab
  operating room, Joint Commission approve of practical nurse as "scrub" nurse? 684
  operating room, take pictures with electronic flash attachment? 152
  parenteral feeding (high calorie) after, Brazil, 699
  plastic, paying for, under N.H.S., England, 965
  postoperative aldosteronism, N. Z., 705
  postoperative care, Brazil, 62
  postoperative parotitis vanishing, [Robinson] 1410—ab
  postoperative tetany, insensitivity to vitamin D, [Dent] 1483—ab
  postoperative trauma, increased aldosterone excretion, [Llaurado] 225—ab
  postoperative vomiting, dimenhydrinate for, [Moore & others] *1342
  preoperative use of hexachlorophene on skin, N.N.R., 1635
  radiological diagnosis of retained sponges, [Olnick & others] *1525
  risk in coronary heart disease, [Etsten & Proger] *845
  safe for patient with positive syphilis test but no evidence of lesions? 1076
  shock, therapy, [Lundy] 1496—ab
  skin bank, homografts, [Brown] 1413—ab
  streptococcal enzymes to close contaminated incisions, [Smith] 718—ab
  transilluminators and illuminated retractors for, [Berens] *1532
  Trendelenburg position not necessary with muscle relaxants, England, 142
SUTURES
  subcutaneous, to fix skin flaps in mastectomy, [Larsen] *24
  unabsorbable, and ligature, hanging bladder stones on, [Levack] 1492—ab
SWALLOWING
  dysphagia in so-called late chlorosis, [Kruisinga] 714—ab
SWEAT
  antibiotics (topical) effect on axillary odor, [Shelley & Cahn] *1736
  deodorization in poorly ventilated rooms, 1174
SWEAT GLANDS
  absence of, ectodermal dysplasia presenting as fever, [Stiles & Weir] 158:1432, Aug. 20, 1955; (correction) 159:615, Oct. 8, 1955
  involvement doubtful in adenoma sebaceum, [Zeligman & Scalia] 708—C
SWIMMING
  long immersion in cold water, England, 1396
  public pool, allow child with tinea capitis to use? 234
  Red Cross manual for the handicapped, 692
SWINDLERS: See Impostors
SWINGLE'S CORTICAL EXTRACT
  for adrenocortical hypofunction, [Rowntree] *1527
SYMPATHECTOMY
  adrenalectomy with, for hypertension, [Yeager] 223—ab
  for occlusive arterial disease, [Pratt] 1064—ab
  for thromboangiitis obliterans; clinical condition parallel oscillometer? 154
  intermittent with claudication, [Mavor] 1687—ab
  splanchnicectomy and/or adrenalectomy with, in hypertension, [Cartier] 814—ab
  thoracic, posterior upper; improved approach, [MacKay] *1261
  thoracolumbar, for hypertension, [Zintel] 81—ab; 626—ab
SYMPATHICOGONIOMA (neuroblastoma)
  in children, England, 393
SYNCYTIOMA MALIGNUM: See Chorioadenoma
SYNKAYVITE: See Vitamins K
SYNNEMATIN B
  new penicillin, England, 1397
SYPHILIS
  changing aspects, Italy, 1144
  congenital in children, penicillin evaluated, [Dembińska-Widy] 1163—ab
  pain in knees 6 years later, further treatment indicated? 1499
  pulmonary, gummatous form, Brazil, 1323
  seropositive tests without signs of disease, (use of Treponema immobilization test, reply) [Hartman] 738; (surgery safe in?) 1076; (pneumopathies with) [Cerviá] 1153—ab
  treatment, corticotherapy before penicillin, [de Graciansky] 76—ab
SYRINGE
  boiled instead of autoclaved, hepatitis from? 1078
  rubber prop for intravenous anesthesia, [Potter] 808—C

Acad. of Psychosomatic Med., 496, 1387
Ackerly Soc. of Psychiatric Residents of the University of Louisville (Ky.) School of Med., 1464
Aero M. A., 792
  M. Engineering A., 493
Air Pollution Found., 1034
Alabama Department of Health, 1553
  Soc. of Crippled Children and Adults, 1776
  State Vocational Rehabilitation Service, 1776
Alameda-Contra Costa County (Calif.) M. A., 197, 200
Alameda County (Calif.) Heart A., 493
Alaska Board of Health, 1779
Albany County (N. Y.) Department of Public Welfare, 1132
Albert, Isaac, Research Inst., 1312
Allergy Found. of Northern California, 1310, 1553
Alpha Omega Alpha, Gamma Chapter, 1129
Alumni A. of the Jersey City (N. J.) M. Center, 1132
Am. Acad. for Cerebral Palsy, 614
  Acad. of Arts and Sciences, 1668
  Acad. of Dermatology and Syphilology, 1315
  Acad. of General Practice, 131, 197, 199, 200, 385, 387, 493, 1036
  Acad. of General Practice Chapters: Arizona, 1037; San Francisco, 197
  Acad. of Neurological Surg., 691
  Acad. of Ophthalmology and Otolaryngology, 614, 1467
  Acad. of Orthopaedic Surgs., 53
  Acad. of Pediatrics, 387, 1312, 1666
  A. for Hosp. Planning, 200
Am. Acad.—Continued
  A. for the Advancement of Science, 54, 1779
  A. for the History of Med., 1556
  A. for the Surg. of Trauma, 791
  A. for Thoracic Surg., 1224
  A. of Blood Banks, 1134
  A. of Hosp. Consultants, 200
  A. of Inhalation Therapists, 958
  A. of M. Clinics, 958, 1669
  A. of M. Record Librarians, 496
  A. of Neuropathologists, 958
  A. of Nursing Homes, 131
  A. of Obstetricians and Gynecologists, 54, 1467
  A. of Obstetricians, Gynecologists and Abdominal Surgs. Found., Inc., 54
  A. of Railway Surgs., 792
  A. of University Women, 614
  Board of Anesthesiology, 1555, 1557
  Board of Clinical Chemistry, Inc., 792
  Board of Internal Med., 1668
  Board of Pathology, 1669
  Board of Preventive Med., 1133
  Board of Psychiatry and Neurology, 1314, 1556
  Board of Radiology, 615
  Board of Surg., 494
  Cancer Soc., 52, 199, 615, 1133, 1134
  Cancer Soc. Divs.: Connecticut, 197; Illinois, 1034; Nebraska, 385, New Jersey, 1132; Oklahoma, 957, 1313; Wisconsin, 1036
  Chemical Soc., 131
  Clinical and Climatological A., 958
  Coll. of Cardiology, 1038, 1224
  Coll. of Chest Phys., 792, 1314, 1780
  Coll. of Chest Phys. Chapters: Mississippi, 1035; New Jersey, 1384; Potomac (W. Va.), 495
  Coll. of Gastroenterology, 791, 1557
  Coll. of Phys., 1311, 1384, 1464
  Coll. of Phys., Montana-Wyoming Chapter, 493
  Coll. of Preventive Med., 1135
  Coll. of Surgs., 386, 494, 792, 1387
  Cong. of Physical Med. and Rehabilitation, 1557
  Cyanamid Company, 1555
  Cyanamid Company, Lederle Laboratories Div., 200, 1131
  Diabetes A., 1388, 1669
  Dietetic A., 691
  Federation for Clinical Research Sections: Eastern, 1314; Midwestern, 958
  Found., 1779
  Found. for the Blind, 1133
  Geriatrics Soc., 1315
  Goiter A., 1223
  Heart A., 613, 692, 693, 1223, 1313, 1557, 1665
  Hosp. A., 131, 200, 1384, 1557
  Hungarian M. A., 1386
  Inst. of Architects, 200
  Inst. of Nutrition, 958
  Korean Found., 690
  Laryngological Soc., 1466
  League Against Epilepsy, 1386
  M. A., 692, 955, 1034, 1222, 1315, 1388, 1464
  M. Soc. of Vienna, 1781
  M. Writers' A., 54, 200
  Neurological A., 959
  Ophthalmological Soc., 959, 1220
  Orthopaedic A., 1224
  Orthopsychiatric A., 1777
  Pediatric Soc., 959
  Pharm. A., 1223
  Pharm. Manufacturers' A., 1387
  Psychiatric A., 493, 1219, 1667, 1777
  Psychiatric A., Midwest Regional Research Conf., 132
  Psychiatric A., Western Div., 791
  Public Health A., 1134, 1668
  Public Welfare A., 1314
  Red Cross, 692
  Red Cross, Rochester-Monroe County (N. Y.) Chapter, 129
  Rheumatism A., 1386
  Rhinologic Soc., 614
  Roentgen Ray Soc., 131, 1387
  School Health A., 1134
  Soc. for Pharm. and Experimental Therapeutics, 54
  Soc. for Public Administration, Capital Dist. Chapter, 1132
  Soc. for the Aged, 1669
  Soc. for the Study of Arteriosclerosis, 1037

  expert, A.M.A. Law Department report, 896
TESTOSTERONE: See Androgens
TETANUS
  diphtheria-pertussis with, for infants, [Barr] 1163—ab
  immunization (combined), England, 210
  immunization for boy who had urticaria, arthralgia and mild edema after previous injections, 1255
  immunization for football players, using livestock field, 828
  immunization, serum-sickness and local reactions from, [Moynihan] 972—ab
  toxoid and typhoid paratyphoid in same injection? 94
  toxoid vs. antitoxin; alum precipitated vs. fluid toxoids, 1699
  treatment, mephenesin alone and with chlorpromazine, [Adriani] 972—ab
TETANY
  parathyroid, calcium lactate plus vitamin D for, 94
  postoperative, insensitivity to vitamin D in, [Dent] 1483—ab
TETRACYCLINE
  clinical use, [McCorry] 149—ab
  to prevent rheumatic fever in penicillin-sulfonamide sensitivity, 633
  toxicity: enterocolitis fatal after, Switzerland, 1050
  treatment of pneumonia, [Bakir] 1678—ab
  treatment, staphylococcic complications, [Brodie] 813—ab
TETRACYN: See Tetracycline
TETRAETHYLTHIURAMDISULFIDE: See Disulfiram
THALLIUM
  poisoning from rodenticides, Sweden, 510
THERAPEUTICS
  hazards of, [Barr] *1452
  powerful placebo, [Beecher] *1602
THIAMINE
  deficiency from active yeast? 633; (reply: lowers blood sugar with no deficiency) [McClendon] 1804
THIAZOLSULFONE
  N.N.R., 1296
THIOCOLCHICINE: See N-Desacetylthiocolchicine
THIOPENTAL SODIUM
  oxygen for respiratory depression from, [Dillon & Darsie] *1114
THIOSEMICARBAZONE
  treatment plus isoniazid in tuberculosis, England, 64
THIOURACIL
  derivatives for thyrotoxic children, [Kunstadter] 1491—ab
THOMPSON OPERATION
  for coronary disease, [Beck & Leighninger] *1264
THORACIC DUCT
  lesions, retroperitoneal anastomosis to hemiazygos vein for, [Brewer] 715—ab
THORACOPLASTY: See Thorax surgery
THORACOTOMY: See Thorax surgery
THORAX
  chest diseases, differential diagnosis, [Banyai] *1272
  chest diseases (occupational), vascular pathology, [Schepers] 528—ab
  chest wall syndrome, pain resembles cardiac pain, [Prinzmetal & Massumi] *177
  chest x-ray every 3 months safe? 980
  chest x-rays, Nellie Lutcher aids drive, England, 1565
  chest x-ray supplements tuberculin testing, England, 209
  chest x-rays to diagnose tuberculosis and other lesions, England, 702
  injuries, management, [Blades] *419
  rounded lesions, [Springer] 1697—ab
  surgery, pneumothorax and thoracoplasty in tuberculosis, [Rabino] 627—ab
  surgery, thoracotomy (exploratory) in chronic mediastinal lymphadenitis, [Leech] 1065—ab
  tumor formation, [Unverricht] 1406—ab
  wall defect, full-thickness skin graft to close, [Dunavant] *1202
THORAZINE: See Chlorpromazine
THROAT
  infection, antibiotic specificity, [Goldstein] 1417—ab
  sore, in unusual epidemic, England, 507
THROMBOANGIITIS OBLITERANS
  coronary localization, [Capra Marzani] 1237—ab
  surgical treatment, sympathectomy; clinical condition parallel oscillometer? 154
THROMBOCYTES: See Blood platelets
THROMBOCYTOPENIA: See Purpura, thrombopenic
THROMBOEMBOLISM: See Thrombosis

THROMBOPHLEBITIS
  chronic, trypsin for, [Wildman] 1681—ab
  migrans and visceral cancer, [Durham] 1061—ab
THROMBOSIS
  anticoagulants to prevent, [von Brandis] 79—ab; (after gynecologic surgery) [Soergel; Röttger] 523—ab; [Scharpff] 625—ab
  auricular, relation to mitral valvotomy, [Belcher] 1686—ab
  cerebral, and senile chorea, reserpine for, [Lemmon] 1148—C
  cerebral, BAL for, [Romualdi] 83—ab
  cerebral, cortisone for, [Russek & others] *102
  cerebral, possible in man 81 with headache, irregular temperature, and numb hands and feet, 534
  coronary (acute), request information, [White] 1148—C
  coronary, diet to prolong life in, [Morrison] *1425
  coronary, risk after bradycardia during anesthesia? 828
  coronary, tobacco in etiology, [Sigler] 1682—ab
  coronary, with myocardial infarction; treatment, [Wood & others] *635
  hazard after ACTH and cortisone in hypercholesteremia, [Adlersberg & others] *1731
  knee flexion in hospital bed cause? 535
  mural, (Diagnostic Problems) [Plimpton & Gambino] *671; (comment) *673
  of abdominal aorta, new sign, [Covey] 72—ab
  treatment, heparin, type recommended, 1803
  treatment, Sintrom, [Moeschlin] 408—ab
  treatment, Tromexan and Marcoumar, [Iversen] 820—ab
  venous (multiple), in pancreatic disease, [Berk] *1079
THYMUS
  disease and tumor formation, [Keynes] 77—ab
THYROID
  blocking agent, endemic goiter from, [Clements] 1484—ab
  cancer in children and adolescents after irradiation, [Clark] *1007
  cancer, I^{131} for, [Ruckensteiner] 1160—ab; [Russo], 1168—ab
  crisis, chlorpromazine plus cooling in, [Hunter] *814—ab*
  enlarged, could cause hand numbness, 1077
  euthyroid cardiac cases, I^{131} for, [Jaffe & others] *434
  exophthalmos and, [Kutschera-Aichbergen] 1060—ab
  extract, prolonged use, auricular fibrillation after, [Hellman] *25
  fetal, I^{131} accumulation in, [Hodges] 85—ab
  function after hypophysectomy, [Li] 1409—ab
  function and cobalt, [Kriss & others] 708—C; [Armstrong] 1480—C
  function, protein-bound iodine to evaluate, [Skanse] 1681—ab
  I^{131} uptake in euthyroid patients [Silver & others] *1
  inflammation (acute), typhoid complicating, Turkey, 1051
  status during thyroid extract, TSH and I^{131} to determine, 829
  surgery for hyperthyroidism, [Clark & Rule] *995
  surgery for toxic goiter, vegetable substances in preparing, [Sittig] 223—ab
  tumors, sarcoma, [Novaes] 1680—ab
THYROTOXICOSIS: See Goiter, Toxic
THYROTROPIN (TSH; Thyrotropic Hormone)
  increased in exophthalmos, [Kutschera-Aichbergen] 1060—ab
  I^{131} and, to determine thyroid status during thyroid extract therapy, 829
TIBIA
  deforming osteochondrosis of, in children, [Enklaar] 725—ab
  fractures, end-result observations on treatment, [Urist] *1088
  regenerate from proximal and distal epiphyses, in boy 2? 1699
TIC *Douloureaux*: See Neuralgia, trigeminal
TINEA
  capitis, allow child to use public swimming pool? 234
TISSUES
  culture isolation of Coxsackie viruses in aseptic meningitis, [Kirby & Evans] *743
  homotransplantation, medico-legal aspects, (Medicine and the Law) [Vestal & *others*] *487
  injuries after x-ray and radium therapy, [Koch] 632—ab
  mycelial *forms* of coccidioides immitis in, [Fiese] 822—ab
TOBACCO
  in etiology of cancer in mice; tars effect on skin and smoke on lungs, England, 392
  in etiology of degenerative coronary disease [Sigler] 1682—ab
  insecticides hazardous? Cause aplastic anemia? 1802
TOBACCO—Continued
  smoke abatement, problem of smoking, [Gordon] *511
  smoking effect on bronchitis incidence, England, 1474; [Oswald] 1794—ab
  smoking in origin of lung cancer, [Ringertz] 515—ab; (England) 1323; (relation to air pollution) [Stocks] 1679—ab
  tar, distribution and absorption in respiratory tract, [Ermala] 732—ab
TOES
  second, chronic nontraumatic dislocation, in *older obese women*, 1174
TOLSEROL: See Mephenesin
TOLULEXIN: See Mephenesin
TOMOGRAPHY
  international course (3rd), in Italy, 132
TONOMETRY
  electronic tonometer, [Ascher] 808—C
  to detect early glaucoma, [Havener & others] 213—C
TONSILLECTOMY
  advised in 3rd episode of retinitis with macular edema? 1424
  poliomyelitis and, [Medical Research Council] 521—ab
  respiratory disease relation to, in children, [McCorkle] 146—ab
TONSILS
  tonsillitis and splenomegaly, [Cronk] 1484—ab
TORNIQUET
  release of, time intervals, 828
TOXEMIA
  burn complication, [Artz & Soroff] *411
TOXICOLOGY: See Poisoning; under names of *specific substances*
TOXICOSIS: See Dehydration
TRACHEA
  fractures in thorax injuries, [Blades] *419
  tracheobronchial secretion retained, dangers; management, [Ransdell] 1687—ab
TRACHOMA
  antitrachoma drives in the world, 615
  Chibret Gold Medal for essay, 693
  treatment, chloromycetin in various concentrations, [Mikuni] 229—ab
  WHO action against, 1049
TRACTION
  lumbar, eliminate factors preventing stretch, [Judovich] *549; (reply) [Varco] 1676—C
TRAFFIC Accidents: See Automobiles
TRAFURIL
  reaction in rheumatic fever, [Saslaw] *653
TRANQUILIZING AGENTS, derivative of Greek word *ataraktos*, [Bauer] 808—C
TRANSILLUMINATOR
  for retinal detachment and surgery, [Berens] *1532
TRANSPLANTATION: See under Surgery
TRAUMA
  brain concussion, serum proteins in, Austria, 1473
  causalgia from, chlorpromazine for, [Dabbs & Peirce) *1626
  cranial injury progressive, neuropathologists discuss, 1230
  dorsolumbar vertebral *fractures* with cord lesions, columnotomy for, [Renes] 1490—ab
  esophagus rupture from, [Overstreet] 814—ab
  face injuries, primary care, [Blocker] *422
  in cancer etiology, Switzerland, 1050
  Industrial: See Industrial Accidents
  kidney insufficiency after, treatment, [Catlow] 147—ab
  neck and shoulder pain from, [Krusen] *1282
  of skull (closed), [Verjaal] 522—ab
  plan for more blood in disaster, [Akeroyd & Crosby] *424
  psychological reactions in mass casualties, [Caveny] *427
  testis loss from; other atrophied; hot flashes and sweats afterwards, 535
  thorax injuries, management, [Blades] *419
TRAVEL
  international, immunization information by U.S.P.H.S., 136
  International Symposium on Health and Travel, first, 958
  vaccination certificates, role of physician and health officer, 852—E; [Miller] 1478—C
TRENCH Mouth: See Angina, Vincent's
TRENDELENBURG POSITION
  for surgery not necessary with muscle relaxants, England, 142
  in lumbar traction, [Judovich] *549; (reply) [Varco] 1676—C
TREPONEMA
  immobilization test to diagnose syphilis, (reply) [Hartman] 738
TRICHINOSIS
  lamb or mutton cause? 738
TRICHURIASIS
  treatment, cardol, India, 1399
TRICUSPID VALVE
  atresia, diagnosis and treatment, [Riker] 1796—ab
  stenosis, diagnosis, [Whitaker] 710—ab
  stenosis and intestinal carcinoid with liver metastases and cyanosis, [Olesen] 222—ab
TRIETHANOLAMINE TRINITRATE BIPHOSPHATE
  coronary vasodilator, [Russek] 820—ab
  treatment of angina pectoris, [Fuller & Kassel] *1708
TRIETHYLENE MELAMINE (TEM)
  toxicity: hematopoietic depression, [Mrazek & Wachowski] *160
  treatment of Hodgkin's disease, [Høst] 1576—ab
  treatment of malignant lymphoid disease, [Hambly] 527—ab
  treatment of ovarian cancer, [Sykes] 818—ab
TRIPELENNAMINE HYDROCHLORIDE
  Cyclaine with, as anesthesia in *peroral endoscopy*, [Adler] *111
TROELL-JUNET SYNDROME
  acromegaly, toxic goiter, diabetes and hyperostosis of cranial vault, Switzerland, 623
TROMEXAN: See Ethyl Biscoumacetate
TRONOTHANE: See Pramoxine
TRUMAN COMMITTEE, A.M.A. resolutions and report on unethical practices, 1549; 1652
TRYPANOSOMIASIS
  American (Chagas' disease), first indigenous case in U. S. [Woody & Woody] *676
TRYPSIN
  crystalline trypsin, N.N.R., 1296
  treatment (aerosol) in bronchiectasis, atelectasis and asthma, [Biron] 515—ab
  treatment of chronic thrombophlebitis, [Wildman] 1681—ab
TRYPTAR: See Trypsin, crystalline
TSUTSUGAMUSHI DISEASE
  chemotherapy, [*Katsura*] *73*—ab
TUBERCLE BACILLUS
  antibiotic-resistant to sensitive, [Allen & Roberg] *1533
  blood medium to cultivate, [*Tarshis*] *1250—ab*
  bronchial vs. to gastric and laryngeal lavage to recover, [Lees] 1682—ab
  drug-resistant, infection with, [Beck] 711—ab
  isoniazid-resistant, significance in pulmonary tuberculosis, [Fox] 527—ab
  on streets from spitting, Turkey, 1051
  streptomycin and isoniazid-resistant strains in untreated tuberculosis, [Chaves] 712—ab
TUBERCULIN
  reaction (intrathecal) in treated tuberculous meningitis, [Rennie] 628—ab
  reactors, 10-year survey in children, [Kassowitz] 1162—ab
  testing in Patna, India, 704
  testing of school children, 28-year study, [Myers & others] *185
  testing plus x-rays in screening, England, 209
TUBERCULOMA
  spontaneous disappearance, [Campbell] 1155—ab
  surgical treatment, lung exeresis, [Bérard] 77—ab
TUBERCULOSIS
  after BCG vaccination, [Gernez-Rieux] 1154—ab
  after cortisone for sarcoidosis, [Lovelock & Stone] (reply) [Israel & others] 69—C
  amyloidosis in, [Wald] 1057—ab
  anemia pathogenesis in, [Miescher] 1408—ab
  bacterial resistance in antimicrobial therapy, [Sweany] 1248—ab
  bovine, fight against, Switzerland, 707
  bronchograms and excision specimens compared, [Simonin] 529—ab
  brucellar pyelonephritis simulating, [Abernathy & others] *1534
  Commonwealth Health and Tuberculosis Con*ference (4th), England, 64*; 209
  control costly in New York City, 1778
  diagnosis and control, tuberculin testing in, [Myers & others] *185
  epidemiological retreat, [Kassowitz] 1162—ab
  hospitalization compulsory for, *England, 1321*
  immunization: BCG, (Switzerland) 510; (Sweden) 1326; (N. Z.) 1565
  immunization: BCG, infant morbidity in Warsaw, [Zapasnik-Kobierska] 524—ab
  in children, meningeal reactions in, [Bour] 1413—ab
  in immigrants, England, 964
  in infant, treatment, 1498
